The wedge of entry of the psychic regard, implied by the use of the word "consciousness," is through the concept of awareness. Lotze spoke of one physical body "taking note of" others. Thus the earth takes note of the sun in a gravitative field; iron filings take note of a magnet in an electro-magnetic field. But awareness commonly implies some mental as well as physical taking note of—something, however rudimentary, of the nature of being acquainted with. Now if we speak of a relational field of awareness as one in which this conscious "taking note of" obtains, the organism which is stimulated and responds is always central within that field. If then we call this central term the psycho-organism, it is the locus of consciousness in the sense of being aware. It is the experienc*ing* term in relation to terms in the environment which are experienc*ed*. That is one way of regarding consciousness in the widest sense of the word. Consciousness is the class of all instances of experiencing on the part of psycho-organisms. Whitehead's percipient event, taking note of physically, is also a perceiving event, taking note of psychically. But of course the psycho-organism, as perceiving centre, is that very complexly integrated system of such psychical events which we commonly call a mind.

There is, however, another way of regarding consciousness. Instead of restricting the application of the word to processes of mind*ing* within the percipient centre, the concept is extended so as to comprise all that is in the field of awareness as mind*ed*. That which one is aware of, no matter how distant its locus of origin may be from the percipient centre, is "in mind," and therefore "in consciousness," as a relational field. One is, no doubt, conscious *in* seeing, or imaging, or remembering; but one is also conscious *of* what is seen, imaged, or remembered. And what one is conscious of has every right to be regarded as in consciousness. This distinction between the "in" and the "of" (as here used) goes back at least as far as Berkeley, who spoke of perceiving as in mind "by way of attribute" and of that which is perceived as in mind "by way of idea." We sometimes speak of the former as "in consciousness" and of the latter as "for consciousness"; or of the former as "subjective" and of the latter as "objective." But the behaviourist is, as he might say, "out for" objective treatment. Part of his motive is to show the futility of subjecticism. Hence, for his treatment, the emphasis falls on that of which one is conscious. Thus E. B. Holt would urge that there is nothing in the subsistent or existent world (for our developed knowledge or our more primitive acquaintance) of which we may not be conscious. For him therefore consciousness is a section through the world of experience, of which section the organism that we speak of as perceiving or conceiving is, in any given particular case, the centre. And Woodbridge (1905) says: "Objects are connected in consciousness in such a way that they become known. It is important to note that, while this is so, the knowledge is wholly determined in its content by the relations of the objects in consciousness to one another, not by the relation of consciousness to the objects."

To be "in consciousness" is thus on this view to be in a field of awareness which may, like space-time, be coextensive with the universe. But this is not the only view—so much turns on definition. Others, without invoking an independent psychic entity, and without denying that there is a widely extensive field of awareness, within which all objects for consciousness are set, would differentiate consciousness as an *imperium in imperio* and restrict it to the organism as the percipient centre within that field. B. H. Bode (1917) goes further and advocates a yet more restricted concept of consciousness according to which some reference to the future is an essential criterion. "Consciousness is behaviour that is controlled by the future." There is much to be said for the contention that *human* consciousness is the mental correlate of behaviour that is controlled by anticipations of the future. James urged that with every definite image "goes the sense of its relations, the dying echo of whence it came to us, the dawning sense of whither it is to lead." But this is not quite what Bode says. He speaks of consciousness as "just a future adaption that has been set to work so as to bring about its own realization." This implies that the locus of consciousness, thus regarded, is the percipient centre. "As Dewey has pointed out, the psychical is correlated with intra-organic adjustments *within* the organism, that is adjustments of the organism considered not with reference to the environment, but with reference to one another." This seems to give to psychology, as commonly understood, a more definite place than is readily to be found in the treatment of Watson. And Yerkes (1917) criticizing the behaviourism of Watson "as simply and solely the physiology of organic activity," claims that there is a science of "psychics" on a par with that of "physics," including in the latter objective physiology and biology. Enough has been said in this connexion to show that it is no easy task to bring to a focus the essentials of behaviourist creed or policy.

Apart from philosophical implications, and apart from its relation, if any, to consciousness, a cardinal feature of this policy is to start out from behaviour as that which lies open to objective observation instead of from introspection, which is supposed to yield some trans-empirical psychic force or energy. Behaviour is the biological "end" of all processes in the organism; it is that which we seek to interpret under the canons of strictly scientific procedure; it is therefore that from which such interpretation should set forth. This, it is urged, has been realized by all the best workers on the problems of animal life; it has been realized in a measure by those who lay stress, in human life, on the importance of conduct. Here the realization needs to be widened and strengthened. Watson would add that it must be formulated in physiological and biological terms. In human life there is no doubt much emphasis on language and on thought. What is language, however, but a subtle mode of behaviour—"laryngeal behaviour" if we include all the contributory bodily processes which centre round oral speech, and, as integrated therewith, the written word? How large a proportion of human behaviour finds its expression in language and its attendant modes of symbolization! But in our adult life much of this has been rendered implicit and no longer gets overt or explicit expression. None the less it is present, as unvoiced "laryngeal behaviour," though "the moment the overt slips into the implicit, instrumentation [the

use of delicate apparatus] becomes necessary to bring the process out for observation" (Watson). Even then it is difficult to interpret the data owing to much abbreviation and short-circuiting.

Now, many who would not care to be labelled behaviourists might provisionally agree that language, expressed or suppressed, is the outcome of thought. But this is not good enough for the physiological behaviourist *pur sang*. Language behaviour and thought must be identified. Thus Watson contended that "thought is the action of language mechanisms." It is not, as some assume, "something, no one knows quite what, that can go on in the absence of all muscular activity. It is a constituent part of every adjustment process. . . . It is not different in essence from tennis-playing, swimming, or any other overt activity except that it is hidden from ordinary observation and is more complex and at the same time more abbreviated." If then thought *is* the action of the laryngeal mechanisms just as swimming is the action of other bodily mechanisms, it clearly follows that thought, for this behaviourist "psychology," in which the word "consciousness" is *taboo*, is a mode of bodily behaviour. In what sense can this be accepted on behaviourist principles? Not without diffidence it may be suggested that to get the answer to this question it is essential to recognize that the organism responds as an integrated whole, and that *all* that follows on stimulation in some life-situation must be regarded as behaviour. Laryngeal behaviour is the outcome of the behaviour of effectors; their behaviour is the outcome of that of a nervous system with its inherited and acquired neuronic pattern; this behaviour in turn is due to that of many receptors under adequate stimulation. All human conduct, including speech, overt or implicit, is the final expression of the behaviour of the organism, man, as a whole; and this organism is what it is, and finally does what it does as the result of all that has happened to it during development under the environing conditions of life up to date. Watson seems to lay chief stress on what has been spoken of above as the final expression —the business end of the whole business. And perhaps he would regard what has been said as involving an unwarrantable extension of the concept of behaviour. But there is much, even in his treatment, which lends colour to such an interpretation of that which he would regard as the cardinal policy of behaviourism.

The physiological story above outlined is a familiar one. Watson tells it admirably and adds effective and illuminating touches. He is honest in confessing that much still remains conjectural. One is left in wonder, however, why when the ship of psychology is lightened by throwing consciousness overboard, thought also should not be silently dropped over the stern. Then the vessel thus rendered thoroughly seaworthy might be rechristened and given some more appropriate name under which to pursue her voyage. Psychology seems a misnomer.

The name is, however, retained. So let that pass. Revert to the emphasis on the final expression in act and deed. Here is a bit of sound policy. It is this final expression which is of prime importance in animal behaviour and in human conduct. Herein lies the pragmatic value of behaviourist treatment. Men have, for example, to be selected for vocational work, for service in the social community, as promising for this job or for that, on occasion as likely to be efficient in the army. They must be chosen for what they can *do*, and do rapidly, surely and well. It is claimed, and there is evidence to substantiate the claim, that the behaviourist with his stress on the effective output in conduct, is able to make a wiser choice than the "orthodox" psychologist who is said to be obsessed with the older intellectualistic methods which involve too much reliance on the methods of introspection only—whose "pure psychology" is of slender value in its application to the current problems of busy life. In another field of practical application it is urged that the methods of behaviourism will be fruitful. Both Watson (1916) and Holt seek to apply them in the procedure of psycho-analysis; and the latter author interprets the *Freudian Wish* in terms of his special form of behaviourism and his relational treatment of consciousness. One may hazard the opinion that a judicious dose of behaviourist interpretation may serve as a corrective of some of the tenets of what now goes by the name of the New Psychology.

Of late years in England it is instinct in man, rather than in animals, that has occupied the attention of psychologists and sociologists. For this purpose the definition of instinctive behaviour as that which is unlearnt—the form of which is not acquired in the course of individual experience, coming by nature and not through nurture—has been found not only difficult of application in human life but scarcely serviceable for marking a contrast which calls for emphasis. Instead therefore of using the word "instinctive" to mark those forms of behaviour which are unlearnt and not individually acquired, some use it to distinguish those modes of behaviour which take form unreflectively from those which are the outcome of rational thought under fully deliberate choice. Thus the instincts of the herd, with which W. Trotter has dealt in an able and illuminating manner, are, in part at least, modes of behaviour which have been learnt under the social conditions of gregarious life, which are in large measure due to tradition, and which are only endorsed under the long familiar process which has of late been called rationalization. Here the bolstering up by some assigned reason is subsequent to the "instinctive" performance of the act. In all this there is nothing which cannot, under appropriate definition, be interpreted on behaviourist principles.

There is, however, another way of dealing with instinct, either in the unlearnt or in the not-reflective sense, which will be rejected by most, if not all, behaviourists—nay more which is rejected by many of the leading American psychologists and philosophers who would not wish to be regarded as exponents of behaviourism. This is the increasingly prevalent doctrine in England according to which instincts are forces of character, modes of psychic energy, prime movers of human conduct, types of true mental activity, exemplars of genuine impulse, as the rational psychologist and not the physiologist understands this word. It finds able expression in W. McDougall's *Social Psychology*, in A. F. Shand's *Foundations of Character*, and in J. Drever's *Instinct in Man*. It is traceable in W. Trotter's *Instincts of the Herd*, in L. T. Hobhouse's *Mind in Evolution*, and in W. H. R. Rivers' *Instinct and the Unconscious*. For those who advocate a new psychology, this seems to be a pivotal concept in the increasing literature of psycho-analysis. Its spiritual father in England is James Ward, whose article PSYCHOLOGY in the *E.B.*, 9th Ed., marked a turning-point in thought. It has been fostered through the influence of Henri Bergson. It involves the concept of a "kind of causality so connected with the nature of conative consciousness that it can belong to nothing else" (G. F. Stout, to whose *Manual* an important chapter on Instinct has been added, 1913).

If there is any validity in the characterization of behaviourism outlined above, *this* is the psychology which its supporters seek to supplant, since it involves, as they aver, a bifurcation of nature through the introduction of trans-empirical concepts. And assuredly those who hold this creed will, on their part, utterly reject behaviourism.

See J. B. Watson, "Psychology as the Behaviourist views it," *Psych. Rev.* xx., 1913 (to this article may probably be assigned the introduction of the word); *Behaviour* (1914); *Psychology from the Standpoint of a Behaviourist* (1920); E. B. Holt, *The Concept of Consciousness* (1914), *The Freudian Wish* (1915). See also *Jour. of Philosophy, Psychology and Scientific Methods* from 1904 to date. The dates in the text after the names of Bode, Weiss, Yerkes and others refer to articles in this journal under the years of publication. W. James's "Does Consciousness Exist?" appeared in the first volume and is reprinted with other pertinent papers in *Essays in Radical Empiricism* (1912). (C. Ll. M.)

BEILBY, SIR GEORGE THOMAS (1850–), British physicist, was born at Edinburgh Nov. 17 1850, his father being a physician. He was educated at Edinburgh University and trained as a civil engineer. When quite young he developed, in collaboration with the late William Young, a new method

of retorting oil shale, in which by carrying out the operation in two stages, each at the most suitable temperature, most of the fixed nitrogen in the spent shale, which had previously been lost, was obtained as sulphate of ammonia. Between 1881 and 1894 this method entirely displaced the older methods of retorting, and the industry was enabled to hold its own in competition with imported petroleum products. In 1891 Beilby invented and developed a new synthetic process for the manufacture of the cyanides of potassium and sodium, by the use of which gold and silver are recovered from their ores. The cyanides are produced by passing ammonia gas through a molten mixture of the carbonates of the alkalis with charcoal, at a temperature of 850° C. An important British industry was founded on this process, the first factory being opened at Leith in 1891. Beilby was elected F.R.S. in 1906. He was president of the Society of Chemical Industry in 1899, of the chemical section of the British Association in 1905, of the Institute of Chemistry in 1909–12, and of the Institute of Metals in 1916–8. In 1912 he was a member of the Royal Commission on Fuel and Engines for the Navy. During the World War he was a member of the Admiralty Board of Inventions and Research. He was knighted in 1916. He published many scientific and technical papers, and also *The Aggregation and Flow of Solids* (1921).

BELASCO, DAVID (1859–), American playwright and manager, was born at San Francisco, Cal., July 25 1859. After graduating from Lincoln College, Cal., in 1875, he was stage-manager at several theatres and then went to New York where he owned and managed the prosperous Belasco theatre. He wrote or adapted some 200 plays, largely melodramatic, and owing to his mastery of stage-craft he was eminently successful as a producer and stage director. He presented E. H. Sothern in *Lord Chumley* (1887); Mrs. Leslie Carter in *The Heart of Maryland* (1895); Blanche Bates in *Naughty Anthony* (1899); Henrietta Crosman in *Sweet Kitty Bellairs* (1903); and David Warfield in *The Music Master* (1904).

Of his numerous other productions may be mentioned: *May Blossom* (1884); *The Charity Ball* (1887, with H. C. De Mille); *Men and Women* (1890); *The Girl I Left Behind Me* (1893, with Franklin Fyles); *Madame Butterfly* (1900); *Madame Du Barry* (1901); *The Darling of the Gods* (1902, with John Luther Long); *The Girl of the Golden West* (1905); *The Return of Peter Grimm* (1911); *The Governor's Lady* (1912); *The Temperamental Journey* (1913); *The Secret* (1914); *A Celebrated Case* (1915); *The Boomerang* (1915) and *Polly with a Past* (1917).

BELCHER, JOHN (1841–1913), English architect, was the son of John Belcher, an architect of some position. He probably derived much of his artistic faculty from his family connexion with William Woollett, the 18th century engraver. Following his father's profession, his education included a couple of years in Germany. He further made a lengthy stay in Paris, studying and sketching modern French architecture, the result of which asserted itself in his first important commission —the Royal Insurance offices in Lombard Street—a French Renaissance building (since pulled down) in which he introduced much sculptured work from the hand of Thomas Thornycroft. Joining his father in the latter's practice John Belcher, Jun., received many commissions, principally, for the next 10 or 15 years, for business premises in the city and elsewhere. Amongst the earliest of these is the well-known block at the corner of Poultry and Queen Victoria Street, a building showing how strongly he was influenced at that period by the Gothic movement of which Street and Burges were the prominent exponents. After his father's retirement in 1875, Belcher associated himself at various times with a succession of partners— J. W. James, Beresford Pite and J. J. Joass. His most important work was that resulting from his partnership with the last, and it evidences a monumental strength and dignity of design to which his earlier achievements had been leading. His intense and always vividly expressed admiration for Norman Shaw was a great factor in his artistic evolution, but even a more powerful one was due to the preparation and study involved in his production of the important volumes on *The Later Renaissance in England*, in which he was associated with Mervyn Macartney as joint author. His Electra House, Finsbury, and Whiteley's vast store, Bayswater, are admirable examples of business premises based upon plans thoughtfully and practically conceived, and possessing a fine and dignified architectural treatment. Belcher was not responsible for many churches, but his Holy Trinity church, Kingsway (1909), is an interesting essay in the classic manner, and the Catholic Apostolic church in Maida Vale being on very similar lines, may compare with any of the Gothic town churches designed by Pearson. His domestic work—especially that at Stowell Park for the Earl of Eldon —had much grace and charm, and evidenced his sympathy, previously noted, with Norman Shaw's methods. Apart from his profession Belcher displayed considerable gifts as singer, composer and conductor. His talents received recognition in many directions and he was the holder of various distinctions in his own country and elsewhere. He was elected Royal Academician in 1909, and in 1907 received the gold medal of the Royal Institute of British Architects, of which he had been president in the preceding year. Russia, Belgium, Germany, Spain and the United States elected him a member of their several architectural societies. He died in London Nov. 8 1913.

(C. H. To.)

BELGIAN CONGO (*see* CONGO FREE STATE, 6.917).—Readjustments of the Congo-Uganda frontier, and the incorporation in 1919 of the greater part of Urundi and Ruanda, increased the area of the colony by some 19,000 sq. m., and its inhabitants by, approximately, 2,500,000 to 3,000,000. The total area of Belgian Congo in 1920 was estimated at 928,000 sq. m. A census was taken for the first time in 1917. It was not complete but indicated that the pop. was little more than 7,000,000. In 1921, including Ruanda and Urundi the estimate was 10,-000,000. In 1918 white inhabitants numbered 6,487, of whom 3,307 were Belgians. British numbered (in 1917) 820, of whom 588 lived in the Katanga province. Elisabethville (founded 1910), the capital of Katanga, had a white pop. in 1920 of about 1,600. It had many fine buildings and most of the amenities of a European town.

Trade, Agriculture and Communications.—The most striking development in the resources of the country from 1909 was the exploitation of the copper mines of Katanga. They were worked by the Union Minière, in which British capital was largely interested. Since Dec. 1909 the mines had had a direct outlet by railway to the E. coast at Beira. The output of copper rose from 997 tons in 1911 to 27,462 tons in 1917; it was 22,000 tons in 1919 and 19,000 tons in 1920. The copper-bearing belt is about 250 m. long and from 25 to 50 and more m. wide. The chief mine is at Kambove and has been worked since 1913. The ore is smelted at Lubumbashi, where in 1918 were seven furnaces with a producing capacity of 40,000 tons a year. Up to the outbreak of the World War all the Katanga copper was bought by Germans; thereafter it was sent to Britain. Tin is also mined in Katanga, but up to 1921 little had been done to exploit its iron and gold deposits and diamondiferous areas. Since 1913, however, an extensive diamond field in the Kasai basin along the Angola border has been worked. The stones, averaging ten to a carat, are found in the river gravel or in alluvial deposits. The output was about 90,000 carats in 1917 and over 200,000 carats in 1920. The gold mines at Kilo and Moto, worked since 1905, had an output in 1918 of some 90,000 ozs. The gold is found in placer deposits.

Next in importance to copper mining was the development of the palm-oil industry, which up to 1911 had been practically confined to the Mayumba district. In that year the British firm of Lever Bros. obtained large concessions in the interior to develop the cultivation of the oil-palm and to erect factories on the spot for crushing the oil. The company set to work with energy and the result was seen in largely increased exports. In 1910 the export of palm kernels was 6,141 tons, of palm oil 2,160 tons; in 1916 the figures were 22,391 tons and 3,852 tons respectively. Cocoa, rice and cotton were also increasingly cultivated and the fall in the value of rubber led to a much larger collection of copal, the amount exported, 2,139 tons in 1911, being 8,719 in 1916.

The value of exports, about £6,500,000 in 1910, was over £11,000,-000 in 1916. During that period rubber fell from being 77 % to 15 % in value of the exports of produce of the colony, though the quantity exported—3,000–4,000 tons—was about the same. From 1914 onward copper and palm kernels and oil were the chief exports. A considerable part of the trade, export and import, was in transit, chiefly with French Congo, which had no direct communication with the sea except through Belgian Congo. The value of imports

fell from £3,300,000 in 1910 to £2,380,000 in 1914. It varied much during the World War, being £2,100,000 in 1915, not quite £5,000,000 in 1916, £3,200,000 in 1917 and £3,500,000 in 1918. Before the war 60 to 70% of the imports came from Belgium, which also took the bulk of the exports. During the war external trade was almost wholly with Great Britain; after 1918 Belgium recovered part of the trade, though that with Britain continued much above pre-war figures and was worth £2,000,000 in 1919.

Considerable energy was shown in railway construction and by the end of 1918 there were combined railway and steamer routes from the mouth of the Congo to Dar es Salaam and Cape Town. A railway 168 m. in length from Kabalo, on the Lualaba, along the Lukuga valley to Albertville on Lake Tanganyika was begun in 1911 and completed in 1915. The railway which connects at Sakania with the Rhodesian railways and runs through Katanga reached Elisabethville in Oct. 1910, Kambove, the mining centre, in 1913 and Bukama, at the head of navigation on the Lualaba in May 1918. The length of the Katanga line is 450 m. and it is of the standard South African gauge. From Chilongo, on the Katanga railway, the building of a line westward to the Angola frontier—about 400 m.—was in progress in 1921. This line is to link up with the Benguella railway and put Katanga in direct communication with Lobito Bay, thus reducing the distance to Europe, compared with the Beira route, by over 3,000 miles.

Progress was made in improving river and lake navigation. Kinshasa, on Stanley Pool, possessing better accommodation supplanted its neighbour Leopoldsville as chief river port in 1915. In 1911–3 a pipe-line was laid from Matadi, on the Congo estuary, to Stanley Pool to supply the river steamers with petroleum for fuel and reservoirs capable of holding 8,000 tons of oil were built. In 1921 a seaplane service was started along the Congo river from Stanley Pool to Stanley Falls.

Revenue.—Taxes on imports and exports, not exceeding the equivalent of 10% *ad valorem*, direct taxation of Europeans, and a poll tax on native adult males, a tax on ivory and the Government share in the exploitation of mines were the chief sources of revenue; the administrative services and interest on debt the largest items of expenditure. The abandonment of the trading monopolies of the old Congo Free State, and the taking over of its loans put a severe strain on the resources of the colony. Revenue increased from about £1,400,000 in 1909 to £2,320,000 in 1918. In each of those years expenditure was greater than receipts by sums varying from £400,000 to £1,500,000 and new loans had to be contracted. The public debt in 1919 was 340,000,000 francs. With the development of commerce, and especially of the Katanga mines—in which the colony had a two-thirds interest—the prospects of balancing the budget became good. A loan of 500,000,000 francs was raised in 1921 for public works.

History.—From the date of its annexation by Belgium (Nov. 15 1908) the country was placed under the control of a colonial minister responsible to the Belgian Parliament, which has modelled the administration much on the lines of a British Crown Colony. The abuses and misgovernments which were fostered by the Leopoldian régime were remedied as quickly as was possible. Most of the trade monopolies held by Leopold II. and his associates were abandoned and foreign traders encouraged. Care was taken that the natives enjoyed security of land tenure—though ownership remained with the State—and the right to dispose of their own labour freely. Moreover in 1910 the natives were granted a measure of local autonomy; their chiefs were—for the first time—officially recognized and were entrusted with large powers. These powers had a tendency, however, to make the chiefs, at least those of minor importance, simply agents of the State.

Another step in decentralization was taken in 1912 by the subdivision of the former unwieldy territorial division and by the grant of wider initiative to the commissioners of the divisions. But it was found that the Government was still too highly centralized and, in 1914, the various divisions were grouped into four provinces over each of which a vice-governor-general presided, aided by a consultative council on which non-official Europeans had seats. This left the governor-general, and the council of government free to deal with matters affecting the colony as a whole, including the preparation of the budget. The governor-general had, however, practically no authority in the province of Katanga, which, in 1910, except that it had no separate budget, became a separate colony. Its vice-governor-general exercised all the executive functions of the governor-general and corresponded directly with Brussels.

In general the new native policy was successful, though trouble arose from the difficulty, due to crippled finances, of securing an administrative personnel of the best type. Many of the old agents of the Congo State had to be retained. One of these officials in the Tanganyika region was in April 1912 sentenced to ten years' imprisonment for summarily executing 11 native prisoners, including 4 women and a child. But that the natives as a whole were satisfied was shown by their attitude during the World War. A column of about 600 men coöperated with French forces in the operations in Cameroon and other units aided in the defence of northern Rhodesia. An army of over 10,000 men was raised for service in the East African campaign. At the outset of the war Belgium had endeavoured—unsuccessfully—to preserve neutrality in her Congo colony, and the first act of hostility was committed by the Germans (*see* East African Campaigns). In the result the north-western part of German East Africa was conquered by the Belgian native troops (as described in the article on the campaign) and from Sept. 1916 to March 1921 a considerable area of that country was under Belgian administration. Of this area nearly all the province of Urundi and the greater part of Ruanda were permanently assigned to Belgium by an Anglo-Belgian agreement of Sept. 1919. This was a notable addition not so much to the area as to the resources and population of the Belgian Congo. Ruanda and Urundi are healthy, fertile, high-lying regions, thickly populated and great cattle-raising areas. The agreement made Kivu entirely a Belgian lake. By a previous Anglo-Belgian protocol (May 1910) the Congo-Uganda frontier had been modified so as to give Belgium the western shores of Albert Nyanza and in Feb. 1915 another agreement fixed the frontier between Albert Nyanza and the Congo-Nile watershed.

Baron Wahis, the first governor-general under Belgian administration, was succeeded in May 1912 by M. Fuchs. In 1916 M. Henry became governor-general. On his retirement the Belgian Cabinet departed from precedent by choosing, Jan. 1921, as the new governor-general a man without previous colonial experience—M. Maurice Lippens, governor of East Flanders. M. Louis Franck, the Belgian Colonial Minister, paid a visit to the Congo in 1920. His visit coincided with a period of unrest both among the white civil servants and among the natives, due to the high cost of living. For some time the majority of the white officials were on strike, while certain native tribes rose in revolt.

Jack, *On the Congo Frontier* (1914); H. Waltz, *Das Konzessionswesen im Belgischen Kongo* (1917); F. Fallon, *L'Agriculture au Congo Belge* (1918). (F. R. C.)

BELGIUM (*see* 3.668).—On Dec. 17 1909, King Leopold II. of Belgium died at the castle of Laeken. He left behind him a Belgium richer and fuller of vitality than that to whose throne he had succeeded. His kingdom's immense economic development, which he had consistently aided and encouraged, had shown him the necessity for such a country, small but overpopulated, of ample foreign markets and colonies. Leopold I. had sought to foster the colonizing spirit in Belgium, but without success. Leopold II.'s eyes were opened by the great African discoveries of 1878 to the possibility of realizing an ambitious scheme for acquiring in his country's interests a vast territory in the centre of the Dark Continent. Amid general scepticism, and aided by a mere handful of men, mostly officers, he had built up the independent state of the Congo. From 1895 onward the Belgian Government had associated itself in his work by opening credits to him, although Parliament remained hostile to the King's bold and enterprising policy. Belgian finance, however, took an interest in affairs on the Congo; and little by little there developed a section of public opinion favourable to the taking over by Belgium of the immense African territory. After a violent agitation against the methods of colonial government in the Congo State, conducted in Germany, England, and America, and supported by certain Belgian politicians, the Congo was ceded to Belgium in 1908.

King Leopold realized that if his country was to remain economically powerful her army must be strengthened, and to effect this was his constant preoccupation; but the Catholic party—in power since 1884—always frustrated his efforts, and up to the time of his death Belgium still preserved her system of recruiting by drawing lots, conscripts who had been drawn having the right to get themselves replaced by substitutes at the cost of a fine of 1,600 francs. This system of substitution was abolished by the Chamber in 1909, and the King on his death-bed signed the law enforcing personal service.

Leopold II. had expressed a desire to be buried with the utmost simplicity, in the early morning, and without official ceremonies. The Government did not think fit to conform to these wishes, however, and arranged an imposing funeral. He was succeeded by his nephew and nearest male heir, Prince Albert, whose consort, Elizabeth, had been born a duchess of Bavaria.

I. Pre-War Situation, 1910–4.—By Belgian constitutional law the heir-presumptive to the throne does not become king until he has taken the oath. Leopold II.'s death consequently entailed a temporary regency which, in accordance with Belgian law, was exercised by a *Conseil de Régence* composed of members of the Government:—T. Schollaert, L. de Lantsheere, J. Davignon, J. Liebaert, Baron Descamps, A. Hubert, A. Delbeke, G. Hellepette, J. Hellebrut, J. Renkin. On Dec. 23, in presence of the Chambers and of delegations from the constituent bodies of the country, King Albert I. of Belgium took the oath of allegiance to the Belgian Constitution. The new King had already shown his intention to carry on his uncle's work, having, while still heir-presumptive, made a journey to the Congo for purposes of investigation. But alongside that keen interest in colonial, economic, and military problems in which he resembled Leopold II., he also from the first showed anxiety for his kingdom's intellectual development and social organization.

Belgium had indeed advanced considerably during the reign of Leopold II. She had not only achieved a high degree of prosperity, but had also undergone an intellectual renascence, giving birth during the second half of the century to a school of writers, painters, and men of science worthy of comparison with those of the neighbouring countries. Furthermore, the development of trade, with its increase in the numbers of industrial workers—in 1910 they numbered 1,270,484—raised social problems with increasing urgency. Belgian trade had found immense markets, thanks in part to the cheapness of its products due to low wages. The growing strength of the trade unions enabled the workers to claim an improvement in their material conditions, and Belgium began to find herself confronted by the difficulty of entering on the path of social reform without compromising her economic stability. Political struggles of peculiar intensity were rendering the situation still more delicate. In Belgium social and economic claims are always mixed up with purely political questions. Social and professional organizations are at the same time political groups, and their action makes itself as much felt in political affairs as in the economic sphere. In 1907 the trade-union movement was divided as follows:—

Socialist unions	142,035	members
Catholic "	40,521	"
Liberal "	1,020	"
Neutral "	11,667	"
Number of women in unions	10,517	"

The socialist unions first tested their strength in the campaign opened by the Socialist party in 1912 for universal suffrage "pure and simple." This campaign coincided with the violent struggle on the education question which began just then between the parties of the Left—Liberals and Socialists—and the Catholic party. The Catholics, who commanded a majority in the Chamber, introduced a bill to put the voluntary schools and the State schools on an absolutely equal footing. Education in Belgium, especially primary education, is largely in the hands of the religious denominations. Their schools, recognized and subsidized by the State, were in many communes the only teaching institutions. It was to these denominational schools that the Government proposed to accord the same treatment as that given by the State to its own official schools.

The proposal raised a storm of adverse opinion throughout the country. A monster demonstration organized by the Socialist and Liberal parties took place at Brussels. The Liberal party, rallying to the principle of universal suffrage at 25 years of age and the single vote, formed a *bloc* with the Labour party in order to oppose the Right, and they issued joint lists of candidates in most of the towns. The Catholic party, nevertheless, proved successful in the elections of 1912, preserving a majority in the Chamber.

These elections, maintaining in power a party that had governed uninterruptedly for 28 years, had grave consequences. The Catholic party was strongest in the rural districts and in the small Flemish towns. The Walloon districts, more industrial in character, returned a large majority of Liberals and Socialists. On the morrow of the Catholic victory violence of party feeling, much exasperated by the new Education Act, led to an outburst of rage and indignation in the more politically advanced parts of the country. In certain Walloon circles there arose the idea of the administrative separation of Flanders from Wallonia. Flanders should remain Catholic; the Walloon country should be free to have the advanced (Left) Government it desired.

This movement, combining with that concerned with the language question, threatened serious results. "*Flamingantisme*," which originated in democratic aspirations, seeking to bring together in Flanders the common people, Flemish of speech, and the French-speaking *bourgeoisie*, had little by little—obsessed by its dominant idea and by a sort of regionalistic mysticism—turned towards reaction. The language question had been dealt with by various laws—that of 1878 regarding the use of the languages by public authorities; that of 1898 about the publication of laws; that of 1910 on free secondary education; and by the laws of 1913, on the use of the languages in the army, and of 1914, on primary education, which were designed to complete the legal equality of the Flemish language with the French. Yet in the hearts of a minority, a desire was shaping itself to expel the French language from Flanders.

In 1913 a bill was introduced in the Chamber proposing the division of the army into Walloon and Flemish units, but was defeated by an immense majority. This did not deter three deputies—a Catholic, a Liberal, and a Socialist—from proposing to the Chamber in 1914 the *Flamandization* of the university of Ghent, in which French was the official language.

The Government did not perceive that by pursuing a course of purely party politics they were stimulating the growth of this separatist movement, and despite the protests of the Left they once more brought before the Chamber their Education bill, which they had temporarily abandoned. To counter this, and to force upon the Chamber the adoption of the universal suffrage "pure and simple" which they demanded, in April 1913 the Socialist party organized a general strike, which spread over the whole country, involving many hundred thousands of workers. The Government would not yield, however, and their Education Act became law. If in this the Catholic party had gained an undeniable victory, it had been at the price of adopting compulsory education, which for many years past had been advocated by the Liberals. It was now enforced by the laws of May 19 and June 15 1914.

Educational System.—School attendance is obligatory from 6 to 14 years of age. The *juge de paix* has to admonish recalcitrant parents; and if they persist in neglect of their duty, they are first officially warned before the final steps are taken of the infliction of a fine and the posting of their names in their commune. By the law of May 19 1914 each commune must possess an official school. One or more voluntary schools, if such exist in the district, may be "adopted"; but if this is done a communal school must still be provided, supposing it is demanded by a sufficient number of the inhabitants to ensure it an effective minimum attendance of 20 children. In all schools, whether official or adopted, the teachers must be Belgian and *diplomés*. The State inspects both communal and adopted schools, and they receive grants from the central authorities of province and commune. Education is free, and the necessary books and appliances are provided free for poor families. The syllabus of primary schools includes religion (but fathers can claim their children's exemption from religious instruction), moral teaching, reading, writing, arithmetic, weights and measures, the language used by the majority of the local population, geography, history of Belgium,

drawing, hygiene, singing and gymnastics. In the girls' schools needlework, domestic economy, and housewifery are added. In agricultural districts agriculture and horticulture are also taught. Further, the State subsidizes such initiative on the part of communes as the formation of classes (such as exist in Ghent, Brussels, and Liége) for backward and non-normal children, on the provision of 4th-degree instruction This 4th degree, first adopted by the commune of St. Gilles consists of technical instruction for children of 12 to 14. Its object is to give elementary training sufficient to enable the child to specialize as artisan or craftsman, and so to enter industrial life already qualified.

Belgium's efforts to develop the technical training of her population increased steadily during the last few years before the war, much being done in this way by the provinces and communes. Hainault (Hainaut) organized an admirable centre of technical instruction at Charleroi under the name of the Université de Travail. Future workers, male and female, are admitted to its courses at the age of 13 and they receive salaries, which enable them to pass through the necessary years of training. In 1912 1,700 pupils attended this school. All trades are taught there, each with the best possible equipment of tools and machinery. Reading-rooms are open to the pupils, and even also to workmen not attending the school who think they can in the slightest degree improve tools or machines. Concurrently with the technical courses, general courses are given, notably in foreign languages, so that pupils may be in a position to follow the technical periodicals of great neighbouring countries. The province of Hainault finds the large funds necessary for supporting this immense institution by means of a special tax on industrial profits. The great manufacturers of the province not only accepted this tax without complaint, but every year make many voluntary donations to the Université de Travail. To encourage the use of this school by the working-classes the employers of Hainault decided to accept no workers under the age of 18; while assuring well-paid posts to every pupil passing out of the Université de Travail. This close collaboration of public authorities, manufacturers, and workers produced most remarkable results in the course of a few years. Besides the Université de Travail there are provincial schools of arts and crafts, agricultural mechanics, hosiery-weaving, and industrial chemistry. The communes and many trade unions provide housewifery schools for young girls and schools for adults.

As regards agriculture, the State endeavoured to promote specialization in the subject by courses of lectures given all over the country. Such efforts made by public authorities, more especially by the provincial and communal administrative bodies, whose powers are very extensive, are rendered necessary by the social conditions of the country.

Population.—A population which in 1900 numbered 6,693,548 had in 1910 become 7,423,782—an increase of 10·91 % or over 1 % per annum. Density increased from 227 to 252 inhabitants per sq. kilometre. East Flanders contained 374 inhabitants per sq. km., the province of Antwerp, 342, Hainault, 331, the province of Liége, 306, West Flanders, 270, Limburg, 114, the province of Namur, 99, Luxemburg, 52. Thickly populated areas and urban centres developed with lightning rapidity: in Antwerp the population increased 187 % in 50 years, in Charleroi 147 %, in Liége 105 %. The whole population depended for support on the internal resources of the country emigration being almost negligible: in 1910 only 38,854 persons left the country (55 % of them born in Belgium), principally for France (52 %), Germany (13 %) and Holland (12 %). On the other hand, 44,950 immigrants settled in Belgium, coming chiefly from France (41 %), Germany (21 %) and Holland (16 %).

To maintain such a dense population agriculture had to be brought to a pitch of intensiveness unknown elsewhere; and industry, with such vast numbers of hands to draw on, was able to develop with marvellous rapidity.

Industries.—The various industries of Belgium employ a large part of the population. In 1910 this industrial population comprised:

	Persons	Per cent.
Employers, or persons employing members of their own families as employees or workers	260,521	15·23
Members of families as above	91,693	5·36
Employees	87,463	5·12
Workers	1,270,484	74·29
Total	1,710,161 persons	

These were divided among the different branches of industry as follows:—

	Per cent.
Textile industry	15·36
Metallurgical industry	13·32
Clothing "	11·94
Building "	9·58
Mining "	9·08
Timber and furniture-making	8·30

In 1914 glass-making employed 12,000 workmen, maintained 19 furnaces and produced annually 400,000,000 francs worth of glass, or one-fifth of the world's entire output, 95 % being exported. The unchallenged superiority of the Belgian glass-workers, with their centuries of specialization behind them, ensured a privileged position in the markets of the world. Even so, technical development was still advancing, and in 1914 the new Fourcault process had just been successfully introduced. By means of it glass is drawn without being touched by hand from the moment it comes out of the furnace until it is ready for sale as finished merchandise. There were, besides, seven factories producing annually 2 500,000 sq. metres of plate glass, representing a value of 28,500,000 francs, nine-tenths being exported; and the factory of Jumet produced annually 12,000,000 bottles. The Belgian cut-glass trade was equally important. The Val St. Lambert, with 5,300 hands, produced daily 250,000 pieces, an output (90 % exported) realizing annually 13,000,000 francs.

In 1913 the metallurgical trade included: 21 high furnaces with 20,080 hands producing 96,000 tons of cast iron; 6 steel-works with 7,700 hands producing 1,134,000 tons of rough steel and 671,000 tons of finished products; 15 iron-works with 3,402 hands producing 27,100 tons of finished iron and 19,300 tons of finished steel. The steel industry, including coke-fired furnaces, employed in 1913 a total of 39,500 hands, and was represented by 41 factories with 2,198 coke-fired furnaces, employing 4,229 hands and producing 3,523,000 tons; 19 works with high furnaces, 5,289 hands, producing 2,484,690 tons; 28 Siemens-Martin furnaces producing 274,450 tons of rough steel; 84 converters producing 2,192,180 tons of rough steel and 1,400,940 tons of finished steel; 38 transforming plants producing 304,350 tons of finished iron and 448,400 tons of finished steel. The zinc industry possessed 14 foundries with 600 furnaces and 10 rolling mills, and produced annually 200,000 tons of rough zinc and 51,000 tons of sheet zinc. It employed 9,300 hands. The output, nine-tenths of which was exported, was worth 115,000,000 francs.

The collieries, the presence of which brought also the iron, zinc and steel industries to the provinces of Liége and Hainault—the coal-yielding provinces—occupied a particularly important place in Belgium; 125 collieries, possessing 305 pits and employing 145,337 men, were producing annually 22,841,590 tons. In quantity this output nearly sufficed for the needs of the country, which consumed 26,000,000 tons per annum. But in quality the deficit was considerable. The output of steam and domestic coal was excessive, permitting an export of 6,000,000 tons, 5,000,000 of which went to France; while the lack of gas and coking coal necessitated the importation of 9,000,000 tons from Germany.

Although since 1910 the import of coal had exceeded the export, the discovery of two new coal fields permitted the hope that in the future Belgium would produce a quantity far in excess of what she needed for internal consumption. In 1901 deposits of coal were found in the Campine at depths of 430 and 630 metres. The first concessions were granted in 1906, the first sinkings—exceptionally difficult because of the water bearing strata encountered—begun in 1909. No pits had started work before the war. Experimental borings, commenced in the south of Hainault in 1908, established the existence of fresh deposits at depths of 400 and 800 metres. No concession had, up to 1921, been granted by the State in these coal fields.

There were 42 factories for making coal dust into briquettes and other forms of patent fuel. In 1913 these employed 2,000 hands and produced 2,608,640 tons.

Next to the mines must be mentioned the important industry of the stone quarries. In 1913 1,556 quarries, 481 of them subterranean, employed 34,893 workmen, and produced 70,500,000 francs worth of paving-stones, broken stone, hewn stone, marble, chalk, lime, phosphates, plastic clay, dolomite and slate. Depending on the quarries were 70 cement factories in a state of rapid development, the cement export having risen from a value of 12,000,000 francs in 1908 to that of 22,000,000 francs in 1912.

A third group of important industries consisted of the textile manufactures of Flanders (flax, cotton, hemp, jute), and of the Verviers district (wool). In 1910 they accounted for 270,000 workers, employees, and masters; while the related clothing industry employed another 200,000 persons. The total value of the products represented 800,000,000 francs, 350,000,000 of which came from export.

The following table will indicate the relative importance of the different textile industries, and their development during the last years before the war:—

	Persons Employed.	
	1896	1910
Linen	26,205	42,279
Hemp and Jute	3,610	6,509
Wool	32,285	32,846
Cotton	20,435	48,157
Silk	655	1,391
Artificial silk	0	3,573
Lace	47,571	81,213

Imports of raw materials, spun raw materials and woven goods amounted in 1911 to 838,700,000 francs, in 1912 to 985,300,000 francs, in 1913 to 998,400,000 francs. The exports of raw materials, spun goods, and woven goods amounted in 1911 to 871,400,000 francs, in 1912 to 1,033,400,000 francs, in 1913 to 998,700,000 francs.

Commerce.—Belgian commerce was as flourishing as Belgian industry. Facilitated by a network of ways and communications comprising 2,000 km. of water-ways (67 m. per sq. km.), 4,665 km. of broad-gauge railways (158 m. per sq. km.), 4,107 km. of narrow-gauge railways, 9,851 km. of main roads, and 32,000 km. of local roads, import and export trade and transport were intensely active. Belgium's free-trade policy largely contributed to her commercial prosperity. In 1913 the import duties affected only 16·8% of imported goods. They were, moreover, extremely light, in 1900 representing 2·3% of the value of imports, in 1910 1·6%, in 1913 only 1·4%. It is true that a movement was already beginning towards the imposition of duties to check the dumping practised by certain foreign industries, or to induce other nations to admit Belgian goods freely; but this was merely a defensive policy, rendered necessary by that of foreign states.

Commercially Belgium held the sixth place in the world. The total figures of her import and export trades, not including goods in transit, rose as high as 8,765,673,061 francs. In 1913 this total was composed as follows:—

	Tons.	Francs.
Imports	32,656,282	5,049,859,234
Exports	20,885,182	3,715,813,827
In Transit	7,803,734	2,459,924,818

Between 1900 and 1913 Belgian trade had doubled, marking the greatest rate of progress it had ever achieved.

The following table analyzes the elements of the import and export trades:—

	Imports thousands of francs.	Per cent.	Exports thousands of francs.	Per cent.
Live animals	65,273	1·3	4,444	1·2
Beverages and foodstuffs	1,034,822	20·5	327,663	8·8
Raw materials and goods having passed through only one simple process of preparation	2,667,035	52·8	1,826,078	49·1
Manufactured articles	869,478	17·2	1,436,430	38·7
Gold and Silver	413,251	8·2	81,230	2·2

The bulk of the imports consisted of foodstuff products and raw materials. Exports were chiefly manufactured articles and materials which had been subjected to a single process.

In 1913 the trade was chiefly with the following countries:—

	Imports in thousands of francs.	Exports in thousands of francs.
France	1,000,297	762,187
Germany	761,765	940,378
Great Britain	518,47[illegible]	511,710
Holland	356,998	320,930
United States	420,496	103,381
Argentina	316,797	91,154
Russia	267,237	88,379
Congo	48,674	26,978

It is interesting to note that 87·4% of goods in transit travelled by land and 57·4% by sea—figures which demonstrate the immense importance to the port of Antwerp of the foreign hinterland.

Marine trade was served by the ports of Antwerp, Ghent, Ostend, Zeebrugge and Nieuport. The total tonnage of Belgian ports amounted in 1910 to 15,101,171 tons, in 1911 to 16,353,933 tons, and in 1913 to 16,907,417 tons, Antwerp taking first place. The details are as follows:—

	1900	1910	1912	1913
Number of vessels	5,250	6,796	7,043	7,134
Tonnage	6,696,370	12,654,318	13,756,880	14,139,615

In 1913, out of 61,500,000 tons of total imports and exports, 23,650,000 tons passed through Antwerp. The public authorities had devoted ceaseless attention to the development of the port of Antwerp, and at the outbreak of the war it was one of the finest ports in the world, possessing 5,500 metres of riverside wharves, 19,000 metres of wharf-docks, 392 cranes of 2 tons, 8 cranes of 15 to 120 tons, 12 pneumatic floating grain-elevators, one automatic coal-weigher, one barge for ore. The Entrepôt Royal could accommodate 100,000 tons of goods; the granary store had a capacity of 350,000 tons. Numerous private stores and warehouses, a close network of railway lines, and six great dry-docks completed the equipment of the port.

Agriculture.—Belgian agriculture was no less important than Belgian trade and industry. In 1914 the value of its products amounted to two milliards of francs. Agriculture was carried on at a high degree of intensity. Of the 2,945,000 hectares which constitute the national territory, 1,950,000 were in cultivation and pasture, among a population of nearly 7,800,000. The cultivable area per head of population was only 25 ares (in France 100 ares, in Great Britain 45 ares). Belgium, therefore, could not be self-supporting. She was importing ¾ of her consumption of corn. Other foodstuffs were produced in almost sufficient quantity, thanks to scientific specialization. In 1914 stock-breeding produced 300,000 tons of meat, 40 kgm. per head of population per annum. Of sugar, potatoes, fruit, vegetables and horses there was even a considerable surplus available for exportation. The subdivision of land had been carried to an extreme point, 1,950,000 hectares being divided among 829,000 cultivators; 458,000 holdings were of less than one-half hectare; the average for the rest being about five hectares per farm. Thanks to intensive breeding (Belgium in 1914 possessed 317,-000 horses, 1,879,000 horned stock, and 1,954,000 pigs) agriculture commanded larger supplies of manure than in any other country (275 kgm. per hectare). It followed that the yield per hectare of wheat, rye, barley, oats and potatoes also exceeded that of any other country.

The area of cereal cultivation was not very extensive: 750,000 hectares out of a total of 1,430,000 hectares of ploughed land. Permanent pasture represented only 26% of cultivable land (65% in England); while on the other hand plants used for industrial purposes, root-crops and forage-crops which yield a much higher return in money, were largely cultivated.

Thus industrial crops occupied 95,000 hectares; forage, 292,000 hectares; orchards, 65,000 hectares; market gardens, 27,000 hectares; horticulture, practised especially in the environs of Brussels and Ghent, occupied 100,000 hectares, and provided a considerable export. As regards breeding, the export of Flemish horses brought in 50,000,000 francs.

Finance.—Depite the country's growing prosperity the revenue from taxes was not increasing in amount. Revenue and expenditure for the period 1910–4 (in thousands of francs) were as follows:—

	Revenue.	Expenditure.
1910	815,404	829,456
1912	777,501	895,773
1914	807,314	806,754

Taxes produced an average of about 300,000,000 (40 francs per head of population) of the revenue. In 1913 the national debt amounted to 4,277,000,000 francs. The analysis is as follows (in thousands of francs):—

	Funded Debt.	Floating Debt.	Total.
1910	3,703,403	136,204	3,839,608
1912	3,739,133	352,485	4,092,119
1913	3,743,027	534,272	4,277,299

The Army.—Fully occupied with her economic development, and confiding absolutely in the neutrality which was supposed to be her safeguard, Belgium was giving no real thought in these years to defence. The Liberal party alone stood for the principle of universal military service. The Catholic party had always from electoral motives been firmly opposed to any reënforcement of the army or increase in military expenditure. The King, however, well informed on the international situation, never ceased to press for improvement in the country's military condition. In 1912 M. de Broqueville, then head of the Government, succeeded, despite his party's reluctance, in passing an Act establishing the principle of universal military service. In 1913 a complete reorganization of the army was voted. Having obtained the necessary credits for the fortification of Antwerp, Baron de Broqueville got several bills passed and promulgated numerous orders bestowing extended powers on the general military staff; creating a Supreme Council of National Defence (Conseil Supérieur de la Défense Nationale); establishing schools of artillery, cavalry and military engineering; reorganizing the École de Guerre and the École Militaire; creating *inspections générales* of infantry, cavalry and commissariat; and considerably improving the equipment. These reforms were to be completed as a whole in five years. Already, however, the effective forces were augmented in number; the inclusion of all social classes in the army made it truly representative of the nation; a completely organized mobilization was prepared; confidence was at last felt in both officers and troops.

Such was the situation when suddenly the army found itself called on to the stage of war, to confront alone the formidable hosts of Germany.

II. The World War, 1914.—On Aug. 2 1914, the German Minister at Brussels handed the Minister for Foreign Affairs an ultimatum requiring him to permit the German troops to pass through Belgian territory, and to use the citadels of Liége and Namur for the purposes of their operations against France. A delay of 12 hours was granted for the acceptance of Germany's proposals; on the expiration of that time Belgium would be treated as an enemy. That same night the King presided at the council of ministers; the reply was formal: Belgium was resolved to defend her neutrality, sword in hand. On July 29 the Belgian army had been placed on a reënforced peace footing. On July 31 mobilization had been ordered; 15 classes of militia had been called up, the eight first forming the offensive force, the others

being reserved for the defence of the fortresses. Loyal to her international obligations, Belgium had disposed her forces so as to defend all her frontiers. The first division kept watch in England's direction; the third confronted Germany; at Namur the fourth defended the entrance of the Meuse Valley; while the fifth, concentrated in Hainault, guarded the French frontier.

Germany's ultimatum showed on which side danger lay. Yet the Belgian Government, wishing to sustain to the last moment the part assigned to it by the treaty of 1830, still refused the support of France. It was only when Germany's intention to cross her territory became evident that Belgium informed the nations who had guaranteed her neutrality that she assumed the defence of her fortresses, and that she declared herself ready to coöperate with the Powers in maintaining the integrity of her territory. The third division of the army, under General Leman, was charged with the defence of Liége; the fourth division held Namur; the bulk of the army was massed in the centre of the country, covering Brussels and the lines of communication with France, so as to be prepared for all eventualities.

The Government had convoked the Chambers for Aug. 4 on grounds of urgency, and the King had announced his intention of making the speech from the throne. On the morning of Aug. 4 the King, accompanied by the Queen, proceeded to the Parliament House, in the midst of great popular enthusiasm. His speech affirmed the country's definite decision to offer the enemy an unyielding resistance. The Chamber greeted these words with wild enthusiasm. After the departure of the King, who proceeded immediately to G.H.Q., Baron de Broqueville, as head of the Government, read the note just sent by Germany to the Minister for Foreign Affairs, expressing her intention "to execute, if necessary by force of arms, the measures of security rendered indispensable in view of French menaces." Parliament unanimously accepted war with all its consequences. M. Van der Velde, leader of the Socialist party, announced that his group would support the Government unreservedly. All parties rallied round the King. The Government, moreover, ceased to be a party-government, MM. Goblet d'Alviella and Hymans, leaders of the Liberal Left, and M. E. Van der Velde being appointed Ministers of State.

The Chamber at once set to work on the measures of law necessitated by the situation. Suddenly M. de Broqueville rose to read a telegram announcing the violation of Belgian territory by the German army. The deputies from Liége and its neighbourhood informed their colleagues of the news that their districts had been brutally invaded and occupied; and at once departed for their constituencies, to afford help and protection to the suffering inhabitants. As hour by hour the invasion of Belgium proceeded, the Chamber continued to pass laws delegating its powers, in the event of the invasion of each locality, to the local authorities; augmenting the contingent of the army; granting the Government a preliminary credit of 200,000,000 frs.; penalizing crimes and offences calculated to endanger the safety of the State; cancelling the ineligibility of soldiers for membership of Parliament, in order to permit the immediate enlistment of several members.

The spirit of the country was the same as that of the Chamber. Volunteers were besieging the recruiting-offices. In two or three days 40,000 had been equipped, and tens of thousands, still in their civilian clothes, had been dispatched to the camps for volunteers that were being formed in all directions.

A series of regulations were issued by the Government intended to prevent food-hoarding and the raising of prices, and to assure the food supplies of the nation. Bread was rationed at 400 grammes per head per day; in Sept. this ration was reduced to 250 grammes. Maximum prices were fixed for bread and the various kinds of flour. The right of requisition was given to governors of provinces for bread and flour; to burgomasters for potatoes, salt, sugar and rice; in the event of the invasion of a province the governor's powers of requisition passed to the *commissaires d'arrondissement*, in the case of their retreat to the burgomasters of the communes.

At the *Ministère de l'intérieur* a Central Commission was formed, consisting of one delegate for each province, with representatives of the central administration and of the army, its duty being to see to the sharing-out of the food supplies among all parts of the country. In each province the *députation permanente* (standing committee) of the provincial council was made responsible for the victualling of the province, and had to form committees in the communes to distribute provisions. Each week a return of all the food in the province had to be made by the *députation permanente*.

To ensure the proper working of this great system of food control and distribution, newly created in every detail, penalties were decreed for anyone trying to withhold goods from requisition; such hoards were to be confiscated and handed over to the *Bureaux de Bienfaisance*.

While these regulations were framed to safeguard the nation's economic life, its administrative life was being safeguarded in the event of enemy occupation by the measure passed by the Chamber on Aug. 4 providing for the delegation of powers, which was supplemented later by various royal decrees. Notices were posted in every commune of the country, warning the public that civilians were definitely forbidden to take part in operations of war, and that all arms must at once be given over into the hands of the authorities.

The Invasion.—During the night of Aug. 3–4 the German army crossed the Belgian frontiers. It immediately put into practice a system of terrorism in its dealings with the inhabitants, hoping in this way to terrorize the Government, demoralize the army, and break the national resistance.

The forward march of the German army was marked by an uninterrupted succession of atrocities. Once it was perceived that the Belgian army meant to offer a resistance on which Germany had not counted, pillage, burnings, and massacres began.

On the pretext that the inhabitants were armed, that *francs tireurs* attacked the German troops, the invading military command methodically organized the devastation of the country. Maps were issued to the officers indicating what towns and villages were to be burned down. The siege of Liége, with the preliminary repulses suffered by the German regiment which first attacked the outer forts, gave the signal for a campaign of reprisals directed against the civil population. The villages of Berneau, Monland, Blegny-Trambleur, Barchon, Melen, Soumagne, Romsée, Harcourt, Hermée, Heure le Romain, Vivegnies, Julemont, Olne St. Hadelin, Battice, Grivegnée, Sprimont, Erneux, Francorchamps, and the towns of Visé and Herve, were burned to the ground, although they had been occupied for several days by the German army. Scenes of indescribable savagery were enacted: 623 persons were shot, massacred, or driven with blows of the rifle-butt into the flaming houses to be burnt alive. At Melen 72 men chosen haphazard were shot *en masse*, and finished off by blows with the butt-end under the eyes of their wives and children, who were then ordered to bury them at once. At Soumagne 55 men were shot by the firing-party detailed for executions, while the soldiers perpetrated shocking massacres of men, women and children in the village. At Visé, after the massacre of more than 20 persons, 631 men were led away captive. Not a single village escaped the fury of the troops; everywhere there was a reign of fire and sword. The burnings were scientifically organized. All units were provided with incendiary pastilles, and petrol was sprayed on the houses to be destroyed. At Herve, where more than 300 houses were burned, German inscriptions written by the troops revealed that the abominable deed had been performed by the "Incendiary Army of Düsseldorf."

The entry of the German troops into Liége was marked by tragic incidents. Although the town was completely in the invader's hands, on Aug. 7 German companies suddenly opened fire in the most frequented quarters, where they also set fire to 38 houses, shooting down the inhabitants as they tried to escape. Fifty-two persons perished in the flames or fell by the German bullets.

Between Aug. 4 and 20, in the province of Liége alone, 1,061 persons were massacred, shot, hanged, or burnt by the German troops; more than 2,000 houses and 4 churches were burnt deliberately and by order, not counting those destroyed by bombardment. In the province of Limburg during the same period 65 persons fell victims to similar cruelties.

Liége having been occupied, the German army advanced up the Meuse Valley, and at the same time invaded the province of Luxemburg. The first French contingents now joined the Belgian troops in the neighbourhood of Dinant, Namur, and Arlon. Everywhere advance-guard fighting was delaying the enemy's progress and every skirmish was followed by cruel reprisals on the civil population.

The siege of Namur began on Aug. 20, and was the signal for more butchery. On the eve of the attack on Namur scenes of incredible savagery were enacted in the towns of Andenne, Seilles, and Landen. Without having received the faintest provocation, for three whole days the German troops in occupation of these places never ceased massacring and burning. More than 250 persons perished. These scenes of horror, accompanied by the burning of over 150 houses, culminated on Aug. 21 in the execution of numbers of men, by order of the military authorities. They were shot *en masse*, and finished off with the bayonet or the butt-end, or by kicks. The whole canton of Andenne suffered similar horrors; nine persons were murdered by the German soldiers after subjection to horrible tortures.

Other localities suffered as cruelly. At Spontin 130 of the 160 houses that composed the village were burnt and 43 persons were massacred. At Somme-Leuze, Franc-Waret, Leuze-Longchamps, fire and murder reigned. Scarcely had the tragedy of Andenne been finished when the small town of Zamines was the scene of a yet more terrible drama. After skirmishes with Belgian and French advance-posts, the Germans, who had fought pushing a screen of civilians in front of them, made the civil population responsible for their losses. All the men were first shut up in the church, and then massed in a field, and on the word being given by the military commanders they were shot down by machine-guns. Some were finished off afterwards, chiefly by stretcher-bearers of the Red Cross; 383 men perished, about 100 were wounded, only 200 escaped. The town was burnt to the ground. The whole canton was subjected to horrible atrocities; in the neighbouring villages 114 men were killed by German troops and 567 houses burnt.

Just at the time of the fall of Namur, the German military at Dinant organized an appalling demonstration of terrorism. The town had been occupied on Aug. 22 after some hard fighting with French troops. At nightfall on Aug. 23 German soldiers rushed shouting about the streets, and everywhere fires broke out. The church, the town hall, the entire town were soon in flames. The inhabitants, arrested *en masse*, were either massacred, or else driven into different enclosed places where, after a while, a methodical extermination was commenced. In the presence of their families men were formed into groups and shot; 665 persons were killed, including 75 women and 35 children. This horrible butchery was copied in the neighbouring villages. All of them were partially or completely burnt, any men found—the inhabitants had taken to the woods—were shot; at Anthée and Surice more than 40 men were executed. In the cantons of Dinant, Walcourt, Florennes and Gedinne 946 persons were put to death; and besides the whole town of Dinant and two entire villages—Outraye and Sorrines—1,732 houses and seven churches were destroyed.

On Aug. 23 the German troops entered Namur. Warned of the massacres by frightened peasants who had come fleeing before the enemy, the inhabitants abstained from any demonstration of feeling. The entry of the victorious army was devoid of incident. Yet suddenly on Aug. 24 a violent fusillade rang out in the streets, to continue all that day and all the next. The bishop, Mgr. Heylen, proceeded to the German headquarters to protest against this useless cruelty. He was arrested. After two days the terror ceased; 75 persons had fallen, 15 of them women and 4 children. The town hall, the communal archives, and 110 houses had been burnt down. In the villages surrounding Namur, also, the same brutal work had gone on; between Aug. 23 and 26, 53 men were butchered and over 200 houses burnt.

While thus in the province of Namur 1,040 inhabitants were murdered, and more than 3,000 houses systematically burnt (not counting those destroyed by ordinary acts of war), the province of Luxemburg in its turn was suffering martyrdom. From Aug. 11 onward, wherever the enemy appeared in Luxemburg, atrocities followed, those at Rossignol, Arlon, Zuitigny, Ethe, and Latour being sadly notorious. All these massacres were reprisals for engagements with the French forces. After the battles of Aug. 22 wounded soldiers found in the cantons of Virton and Etalle were killed, and the civil population hunted down and decimated. At Bleid 84 French wounded were tortured and then shot. At Latour Prince Oscar of Prussia presided in person over the execution of 71 inhabitants. At Ethe 218 persons were killed. The inhabitants of Houdemont, warned of the fate which awaited them, escaped massacre by flight; 11 of them were found by the Germans and put to death. At Touches the burgomaster was hanged; at Zuitigny 84 men were executed; at Rossignol, after the village had been set on fire, all the men were collected together and driven as far as Arlon, where 165 of the poor wretches were shot in cold blood. During the month of Aug. over 800 inhabitants of this province perished, and over 1,500 houses were deliberately destroyed.

While the German army was dominating the Meuse Valley by the seizure of Namur, it was at the same time working towards the heart of the country to assure a route for the invasion of France. The Belgian army, after its victorious stand at Harlen on Aug. 12, isolated, unsupported, menaced by 11 enemy army corps, was now forced to fall back on Antwerp.

On Aug. 19 the German army entered Louvain. Just as Visé had been burnt to terrorize the Liégeois, and Andenne and Dinant to bring about Namur's submission, so Louvain had to be burnt in order to hold a terrible example up to Brussels. When the German army was in effective occupation of Louvain, menaced with no further trouble, orders were suddenly given to burn the centre of the town. The inhabitants were subjected to cruel mental torture. The men were collected and decimated, 79 being shot in the presence of their wives and children, while 334 others were sent captive to Germany, where they were paraded through the streets of Cologne under the insults and threats of the populace who pelted them with mud and stones.

Louvain's cathedral of St. Pierre was devoured by the flames, her ancient university and marvellous library were annihilated, and 1,120 houses were ruined. The suburbs suffered likewise. In that canton 1,717 houses were burnt down, 861 houses pillaged, 226 inhabitants shot, and 653 deported to Germany. Aerschot was reduced to ashes, and 178 of its inhabitants were killed.

Enraged by the opposition they met within the environs of Tirlemont, and by the sorties of the Antwerp garrison, the Germans vented their fury upon the numerous villages of Brabant, 594 inhabitants of which perished in the course of burnings, pillagings, and executions.

On Aug. 20 the German army entered Brussels. The entire Belgian army was massed under the protection of the forts of Antwerp. Sorties were made on Aug. 25 and 26 and Sept. 4; on Sept. 9 a general sortie of all the Belgian forces took place, with the object of diverting pressure from the French army, which was fighting on the Marne. Forced to protect itself from the Belgian army's perpetual attacks on its rear, on Sept. 28 the German army commenced the siege of Antwerp. On Oct. 6, after the destruction of the forts, the Belgian army retreated; and on Oct. 10, having eluded capture by the enemy, it took up position on the Yser.

The siege of Antwerp brought yet more fire and carnage. Over 160 persons in the fortified zone fell victims to the German soldiers. The town of Termonde, where the Belgian army again and again successfully opposed the crossing of the Scheldt by the German troops, was at last taken, and was then burnt to the ground.

The province of Hainault did not escape. At Charleroi, after the great battle which took place there, 108 persons were massacred, at Marchienne au Pont 75, at Mons 30, at Tournai 34, at Châtelet 67. In the other villages through which the enemy forces passed, 182 persons were put to death.

It remains to mention the massacres perpetrated by the invaders in East and West Flanders. For these provinces, however, precise figures cannot be quoted, the work of compiling the lists of victims not being yet completely terminated.

The Occupation.—Brussels once in her power, Germany began to organize the occupation of the country. The activities of the government of occupation—headed successively by von der Goltz, von Bissing, and von Falkenhausen—were considerable in all spheres. Always the same main policy emerged: in matters political, economic or social, the one aim of Germany was to make Belgium and all her resources serve the needs of the war; while preparing for her annexation—at the very least for her absorption—in the event of the German victory, and rendering her in any case innocuous as an independent nation by effecting her economic ruin.

The governor-general formed round him a central government, in which the *Zivilverwaltung* (civil administration) played the chief part. Executive powers were in the hands of the governor-general, who legislated by promulgation of orders. A German governor was placed over each province. The Belgian commissaries were deprived of their authority over the *arrondissements*, being replaced by Germans, subordinate to whom were the military commandants who controlled the cantons. The country was divided into the *Gouvernement Général*, placed directly under the authority of the *Zivilverwaltung;* and the *Zones d'étapes*, including Flanders, the *arrondissements* of Tournai and Mons, and the southern part of the province of Luxemburg, governed by the military authorities, who had the right of promulgating orders. These *Zones d'étapes* were completely separated from the rest of the country. Access to them and exit from them were forbidden without permits, which were not readily granted.

Everywhere *bureaux de contrôle* were established to keep a watch on the inhabitants, persons placed under their special surveillance being obliged to report themselves periodically. A network of espionage was spread over the country, enabling the authorities to know what citizens were dangerous, or even simply too influential, so that they might be regarded with suspicion, and arrested on the first pretext.

Not only was the Belgian administration completely deprived of executive power, but the powers of the provincial councils were gradually undermined. In 1915 the right of meeting in ordinary session on fixed dates was taken from them, while the *députations permanentes* (administrative bodies appointed by the provincial councils from among their members) were placed under the direct authority of the presidents of the German provincial civil administration. Still further, from 1917 onward these presidents in each province were authorized to assume themselves the powers of the provincial councils as regarded the receipts and expenditure of the annual budget, and the methods of raising the necessary funds to meet the expenditure. The struggle between the provincial councils and German authority became bitter indeed when the governor general claimed their collaboration in assessing liabilities for the enormous war-tax—varying between 40, 50 and 60 million francs per month—with which he had saddled the country. Nearly all the provincial councils refused coöperation, preferring to accept an arbitrary assessment decreed by the government of occupation, rather than to yield a semblance of legality to its decisions. Henceforward the military governors, and also the German presidents of civil administrations, were empowered to ensure the payment of the tax, and to that end had the right of raising loans in the name of the province. On July 6 1918 the provincial councils were definitively suppressed. Nothing then remained of the Belgian administrative system.

In vain, however, did Germany destroy the machinery of the country's self-government; she could not break the spirit of the nation. The glorious example set by men like M. Visart de Bocarmé, burgomaster of Bruges, who at 80 years of age stood up fearlessly to the German military power, or like M. Max, burgomaster of Brussels, who boldly led the resistance of his townsfolk, going so far as to post on the walls an official contradiction of the news published by the Germans concerning the march of military operations, from the earliest days of the occupation sufficiently indicated to the invaders what the public attitude was going to be. M. Max, when arrested and sent to Germany, there to be subjected to a system of reprisals, had for successor M. Lemonnier, whom in his turn the Germans were obliged to arrest and deport. In every class of society acts of admirable devotion occurred. Hundreds of Belgians were deported to Germany or shot. Names such as those of Gabrielle Petit, Philippe Baucq, the Englishwoman Edith Cavell, J. Corbisier, Louis Neyts, Bodson, Le Grand, Lenoir and many others stand for the heroism of an entire population.

Neither deportation nor executions could ever prevent the spying on behalf of the Allies carried on by thousands of Belgians, nor the publications of a secret press which fought energetically against the occupant power. On Feb. 2 1915 *La Libre Belgique* appeared. Each week until the Armistice it was published and distributed throughout Belgium. At Louvain the *Revue de la Presse* gave the most interesting extracts from the Allied press. In Brussels *L'Âme Belge* made vigorous political propaganda, continuing to appear despite the arrest and imprisonment of its editor. In 1918 *Le Flambeau*, by the method of analyzing foreign politics, taught the public why to expect victory. At Ghent *L'Autre Cloche* stood firm against the Germans and against Activism, as did *De Vrije Stem* at Antwerp. Besides these journals, directed by secret committees of priests, lawyers, university professors and journalists, other smaller papers, appearing less regularly, such as *La Soupe*, *Le Belge*, *Ça et La*, *Patrie*, and *De Vlaemische Leeuw*, sustained Belgian patriotism.

German Legislation.—German legislation was abundant, more especially that of a repressive type. The most trivial regulations carried penalties of extreme severity. Maximum prices, requisitions of bread and cereals, were enforced by penalties extending to five years' imprisonment and a fine of 20,000 marks. Such Draconian measures were not imposed for the sake of the German army's safety; they applied only to the country's internal organization, martial law reigning over all that directly affected the army.

Military tribunals, without any intimation to the public of their creation or of their competence, were charged throughout the country with the application of these new laws. These courts afforded no security to those amenable to their jurisdiction, their procedure was neither public nor contested; the *dossier* not being even shown to the defence, they constituted a purely arbitrary means of government, not a judicial authority.

Along with these military courts von Bissing established by an order of Feb. 5 1915 a judicial system of two degrees. The German governors set over the Belgian provinces were given unlimited power of instituting penalties. Heads of *arrondissements* and commandants were empowered to institute penalties amounting to three weeks' imprisonment. Besides being thus granted legislative powers, these functionaries were authorized to try persons who disobeyed their regulations, the governors sitting as judges of appeal from the judgments of their subordinates. This edict, conferring as it did judiciary powers on officials, opened the door to administrative tyranny, destroying the indispensable safeguard afforded by the separation of judicial and administrative authority. Still worse, this edict established for repressive purposes the principle that a penalty imposed on a guilty person could, should the judge so decide, be inflicted on some other person. Such a measure, permitting the penalizing of an innocent person, when the culprit himself was out of reach, annihilated the personal liberty of the inhabitants of the country. These penal powers were carried yet further by an order of Aug. 3 1917, authorizing the governors to sentence delinquents to total or partial confiscation of property.

Besides endangering public liberty and security these edicts illegally weakened the authority of the Belgian tribunals. It

sufficed for the government of occupation to publish an order concerning any offences, jurisdiction on which it wished to keep in its own hands, and obviously by that act Belgian justice was deprived of its rights, to the profit of German justice. The creation of these tribunals occasioned public protests from the bar of Brussels, as a result of which its president, the Bâtonnier Theodor, was deported to Germany. Even certain offences against common laws were selected by the German administration to be dealt with by itself instead of by the judicial system of the country; a *police des moeurs* (police of public morals) formed in all the large towns being given powers which Belgian law assigned to the public prosecutors and the Belgian courts alone.

But soon the administration of justice was completely taken over by the invaders. On April 7 1918 a permanent German judicial system was established by order in Flanders and Wallonia, their administrative separation having just been effected by von Bissing. The Belgian courts were replaced by German tribunals—*Kaiserliche Bezirksgerichte*—established in the different *arrondissements*. The judges, the public prosecutors and their staff, the recorders and clerks, all were exclusively German, appointed by the governor-general in accordance with the usages of German law. The language of these courts was German, their procedure was that of the German code. Usually one judge presided, but in cases where the authorized penalty exceeded five years' imprisonment sentence was pronounced by three judges. Procedure was rapid. The public prosecutor made all inquiries and perquisitions, and warrants of arrest were issued without preliminary judicial inquiry. The court dealt summarily with all affairs in which the authorized penalty did not exceed one year's imprisonment; in other cases procedure was by judgment. The court decided whether or not the accused should have the right of being defended, defence not being officially authorized save in cases tried by three judges. There was no appeal; and in all cases, immediately the sentence had been pronounced, the judge called upon the military authorities to put it into execution. In the case of a death-sentence the governor-general had the right of pardon. Judges were removable.

This edict, therefore, replaced Belgian judges by German judges, who, being removable, could not afford security. It abolished the right of appeal, and replaced Belgian procedure by German procedure. The accused found himself being tried in a foreign language, without the right of employing defence, or even of defending himself, the courts having power to set aside any evidence they chose to disregard. The Assize Court was suppressed; the jury, that indispensable safeguard of personal liberty, no longer existed. Thenceforward, the same tribunals dealt with misdemeanours and with crimes, inflicting all penalties, including that of death.

In issuing an order of such scope, the governor-general was acting as a legislator. The Belgian constitution, the judicial organization of the country, were abolished and replaced by German laws and judges. Belgium was being treated not as occupied territory, but as a conquered country.

Before describing the transformation of civil justice it will be well to glance at the principles which these German tribunals were established to apply. On Sept. 2 1914 Marshal von der Goltz enunciated in his proclamation the principle underlying the repressive system of an occupant power:—"It is a harsh necessity of war that the punishment of hostile acts falls on the innocent as well as on the guilty." The same principle is found again in the edict of Feb. 5 1915, authorizing the governors to decide that penalties decreed by the German courts of justice should in certain cases be transferred to other persons in default of the culprits themselves. The same principle was applied by a series of edicts empowering the German authorities to take hostages who should pay with their lives for damage done to railway tracks, to inflict heavy fines on communes, to deport the entire population of villages in whose area railway lines had been damaged, to punish whole families for faults committed by single members of them, to treat as guilty all persons found in company with anyone committing an offence. Again, the Belgian was penalized for "not having done" or for "having had the intention to do." Counting on having its task facilitated by the citizens informing against one another, German justice proclaimed that not to give information constituted a misdemeanour, if not even a crime. That a person had "probably been cognizant of an infraction" sufficed to place him in the same position as the culprit, liable to the same penalty. Not only all who should aid, lodge, or feed the subjects of states at war with Germany, but even those who should not give information of their presence, were punishable by imprisonment or penal servitude. One sole mitigation is found: a wife who does not denounce her husband wanted by the German authorities may plead extenuating circumstances and is only liable to from 3 months' to 2 years' imprisonment or penal servitude. Again, every citizen was obliged, under pain of 3 to 15 years' penal servitude, to give information of the arrival in the country of any person belonging to one of the Entente nations, to denounce anyone making or storing munitions, to furnish all information in his power concerning British establishments in Belgium, to denounce anyone refusing to work for Germany.

Yet another new offence was that of being absent from Belgium and not having returned there within a period of two months. This offence was punishable by a fine fixed at ten times the amount of the taxes for which the absentee was liable. And besides new offences, new penalties were also introduced into Belgium by this German legislation. General confiscation of entire property, definitely forbidden by the Belgian constitution and by Article 46 of the Hague Convention, was decreed for infliction upon anyone not immediately denouncing to the German authorities persons placed under special surveillance; and upon persons under German police supervision who, being sentenced, could not be found and arrested. This penalty might be inflicted by the mere order of a governor. It may be added that this attempt on the part of the government of occupation to force the inhabitants of the country to denounce the activities against Germany of persons attached to the Allied armies contravened Articles 52 and 44 of the Hague Convention.

Deportation was introduced as a penalty in 1915 and was inflicted upon those who refused to work for the German authorities, also upon those who did not comply precisely with their obligations towards the police control. It is a fact that deportation was inflicted, even without trial, on persons who for any reason appeared undesirable to the civil or military authorities.

Civil Law.—Belgian civil law was also profoundly modified. On Feb. 3 1915 the Government of occupation abolished the decree of *10 Vendémiaire an IV.* concerning the responsibility of communes in the case of pillage committed openly by force and accompanied by violence. At the moment of Germany's declaration of war against Belgium certain German establishments in the large Belgian towns had been sacked by the mob. The government of occupation deprived the Belgian courts of their competence to try these cases, establishing instead for the purpose a special arbitration court composed of three members—the president, appointed by the German governor-general, one member appointed by the president of the German civil administration of the province, one member appointed by the *députation permanente* of the province (Belgian administration). The presence of this single Belgian adjudicator afforded no security, the president being empowered to replace him by the president of the German civil administration.

Exceptional tribunals were also set up, supplanting the regular Belgian courts, to try cases of dispute concerning house rents. Belgian refugees abroad found themselves unable to enforce their rights in these new courts, the bar—always a special object of German hostility—not having access to them.

A general transformation of the judicial system was begun on April 7 1918. A complete system of German courts was established, comprising courts of first instance (*Bezirksgerichte*), and two courts of appeal (*Obergerichte*), that for Flanders sitting at Brussels, that for Wallonia at Namur. These "imperial tribunals" administered justice in the name of the German Emperor; their personnel was German, appointed by the governor-general;

The province of Hainault did not escape. At Charleroi, after the great battle which took place there, 108 persons were massacred, at Marchienne au Pont 75, at Mons 30, at Tournai 34, at Châtelet 67. In the other villages through which the enemy forces passed, 182 persons were put to death.

It remains to mention the massacres perpetrated by the invaders in East and West Flanders. For these provinces, however, precise figures cannot be quoted, the work of compiling the lists of victims not being yet completely terminated.

The Occupation.—Brussels once in her power, Germany began to organize the occupation of the country. The activities of the government of occupation—headed successively by von der Goltz, von Bissing, and von Falkenhausen—were considerable in all spheres. Always the same main policy emerged: in matters political, economic or social, the one aim of Germany was to make Belgium and all her resources serve the needs of the war; while preparing for her annexation—at the very least for her absorption—in the event of the German victory, and rendering her in any case innocuous as an independent nation by effecting her economic ruin.

The governor-general formed round him a central government, in which the *Zivilverwaltung* (civil administration) played the chief part. Executive powers were in the hands of the governor-general, who legislated by promulgation of orders. A German governor was placed over each province. The Belgian commissaries were deprived of their authority over the *arrondissements*, being replaced by Germans, subordinate to whom were the military commandants who controlled the cantons. The country was divided into the *Gouvernement Général*, placed directly under the authority of the *Zivilverwaltung*; and the *Zones d'étapes*, including Flanders, the *arrondissements* of Tournai and Mons, and the southern part of the province of Luxemburg, governed by the military authorities, who had the right of promulgating orders. These *Zones d'étapes* were completely separated from the rest of the country. Access to them and exit from them were forbidden without permits, which were not readily granted.

Everywhere *bureaux de contrôle* were established to keep a watch on the inhabitants, persons placed under their special surveillance being obliged to report themselves periodically. A network of espionage was spread over the country, enabling the authorities to know what citizens were dangerous, or even simply too influential, so that they might be regarded with suspicion, and arrested on the first pretext.

Not only was the Belgian administration completely deprived of executive power, but the powers of the provincial councils were gradually undermined. In 1915 the right of meeting in ordinary session on fixed dates was taken from them, while the *députations permanentes* (administrative bodies appointed by the provincial councils from among their members) were placed under the direct authority of the presidents of the German provincial civil administration. Still further, from 1917 onward these presidents in each province were authorized to assume themselves the powers of the provincial councils as regarded the receipts and expenditure of the annual budget, and the methods of raising the necessary funds to meet the expenditure. The struggle between the provincial councils and German authority became bitter indeed when the governor general claimed their collaboration in assessing liabilities for the enormous war-tax—varying between 40, 50 and 60 million francs per month—with which he had saddled the country. Nearly all the provincial councils refused coöperation, preferring to accept an arbitrary assessment decreed by the government of occupation, rather than to yield a semblance of legality to its decisions. Henceforward the military governors, and also the German presidents of civil administrations, were empowered to ensure the payment of the tax, and to that end had the right of raising loans in the name of the province. On July 6 1918 the provincial councils were definitively suppressed. Nothing then remained of the Belgian administrative system.

In vain, however, did Germany destroy the machinery of the country's self-government; she could not break the spirit of the nation. The glorious example set by men like M. Visart de Bocarmé, burgomaster of Bruges, who at 80 years of age stood up fearlessly to the German military power, or like M. Max, burgomaster of Brussels, who boldly led the resistance of his townsfolk, going so far as to post on the walls an official contradiction of the news published by the Germans concerning the march of military operations, from the earliest days of the occupation sufficiently indicated to the invaders what the public attitude was going to be. M. Max, when arrested and sent to Germany, there to be subjected to a system of reprisals, had for successor M. Lemonnier, whom in his turn the Germans were obliged to arrest and deport. In every class of society acts of admirable devotion occurred. Hundreds of Belgians were deported to Germany or shot. Names such as those of Gabrielle Petit, Philippe Baucq, the Englishwoman Edith Cavell, J. Corbisier, Louis Neyts, Bodson, Le Grand, Lenoir and many others stand for the heroism of an entire population.

Neither deportation nor executions could ever prevent the spying on behalf of the Allies carried on by thousands of Belgians, nor the publications of a secret press which fought energetically against the occupant power. On Feb. 2 1915 *La Libre Belgique* appeared. Each week until the Armistice it was published and distributed throughout Belgium. At Louvain the *Revue de la Presse* gave the most interesting extracts from the Allied press. In Brussels *L'Âme Belge* made vigorous political propaganda, continuing to appear despite the arrest and imprisonment of its editor. In 1918 *Le Flambeau*, by the method of analyzing foreign politics, taught the public why to expect victory. At Ghent *L'Autre Cloche* stood firm against the Germans and against Activism, as did *De Vrye Stem* at Antwerp. Besides these journals, directed by secret committees of priests, lawyers, university professors and journalists, other smaller papers, appearing less regularly, such as *La Soupe*, *Le Belge*, *Ça et La*, *Patrie*, and *De Vlaemische Leeuw*, sustained Belgian patriotism.

German Legislation.—German legislation was abundant, more especially that of a repressive type. The most trivial regulations carried penalties of extreme severity. Maximum prices, requisitions of bread and cereals, were enforced by penalties extending to five years' imprisonment and a fine of 20,000 marks. Such Draconian measures were not imposed for the sake of the German army's safety; they applied only to the country's internal organization, martial law reigning over all that directly affected the army.

Military tribunals, without any intimation to the public of their creation or of their competence, were charged throughout the country with the application of these new laws. These courts afforded no security to those amenable to their jurisdiction, their procedure was neither public nor contested; the *dossier* not being even shown to the defence, they constituted a purely arbitrary means of government, not a judicial authority.

Along with these military courts von Bissing established by an order of Feb. 5 1915 a judicial system of two degrees. The German governors set over the Belgian provinces were given unlimited power of instituting penalties. Heads of *arrondissements* and commandants were empowered to institute penalties amounting to three weeks' imprisonment. Besides being thus granted legislative powers, these functionaries were authorized to try persons who disobeyed their regulations, the governors sitting as judges of appeal from the judgments of their subordinates. This edict, conferring as it did judiciary powers on officials, opened the door to administrative tyranny, destroying the indispensable safeguard afforded by the separation of judicial and administrative authority. Still worse, this edict established for repressive purposes the principle that a penalty imposed on a guilty person could, should the judge so decide, be inflicted on some other person. Such a measure, permitting the penalizing of an innocent person, when the culprit himself was out of reach, annihilated the personal liberty of the inhabitants of the country. These penal powers were carried yet further by an order of Aug. 3 1917, authorizing the governors to sentence delinquents to total or partial confiscation of property.

Besides endangering public liberty and security these edicts illegally weakened the authority of the Belgian tribunals. It

The nation was further encouraged in its firmness of attitude by the protest of the communal authorities of Ghent, whose refusal to recognize the division of Belgium was answered by the arrest of the aldermen and the deportation of the burgomaster, M. Braun. Ghent was thenceforward administered by a college of aldermen appointed by the German governor-general, who reserved the right of controlling them and substituting himself for them in the exercise of their functions. A German military officer was appointed burgomaster of the town.

The government of occupation hoped to use education as a potent weapon for dividing the country. The Flemish language was proclaimed the only one permitted in the State and voluntary schools of Flanders. Even in Brussels, where French is spoken by a large majority of the population, Flemish was to be the only language of instruction. A transition period was conceded, but from Sept. 5 1918 primary education was to be completely Flemicized.

Flemicizing of Ghent University.—The centre of the whole scheme for the Germanizing of Flanders was to be the university of Ghent. It was to become a tool in the hands of Germany. Flemicization was decided upon in 1915 by the German Government and overtures were made to the professional body. On that body's refusal to submit to the invaders' desires reprisals began, Profs. Henri Pirenne and Paul Fredericq, accused of leading the resistance, being arrested and deported to Germany. The Ghent professors did not flinch before these intimidatory measures, but stood firm. On March 15 1916 an order was issued that thenceforward all lectures in the university of Ghent were to be given in the Flemish language. Professors who did not deliver their courses of lectures were to be placed on the retired list. The new university retained only four professors from the staff of the Belgian university, one of them a German. To fill its professional chairs it had to draw on students, members of the "Activist" party, Dutchmen and Germans. Shortly after, the German authorities celebrated the opening of the university, and the King of Bavaria graced the ceremony with his presence. A characteristic touch was the omission of Belgian history from the syllabus of the university. To attract students all the scholarships in Belgium were allotted to the university of Ghent, and a shameless campaign of intimidation was organized: students in the *zone d'étape* were given the alternative of either being transported as forced labour to Germany or pursuing their studies at the "Activist" university. The latter alternative was backed by substantial advantages, extra food rations being added to the scholarship grants of money. Despite all this, and despite the suspension of lectures in all the universities of the country, not 200 students were recruited.

In 1917 the German authorities began to understand that Flemish opinion could not be counted on to aid in the dismemberment of Belgium, and consequently their treatment of the working-class population of Flanders increased in harshness, deportations becoming particularly frequent. But still attempts were made to foster Activist ideas. Lectures and meetings were promoted for the exposition of German views; the publication of pamphlets and tracts was facilitated; every form of autonomistic propaganda was supported by armed force. In the end it became obvious that no result would ever be achieved by these means, so a new form of propaganda was adopted. At Courtrai an association was formed with the name of *Volksopbeuring* (regeneration of the people). Its supposed object was to raise the moral standard of the Flemish people and relieve distress. It was supported by a committee in Holland consisting of the most exalted personages. In reality it had no other aim but to promote the idea of Flemish autonomy. Its activities were ignored, and remained without result until the day in 1918 when the German Government transferred to it the responsibility, till then belonging to the communal authorities, of distributing sugar, syrup, jam, potatoes, butter, etc. Thenceforward, the whole population of Flanders being forced to apply for those necessaries to the *Volksopbeuring*, propaganda could be made in terms of food, and constraint be exercised directly on each individual through the distribution of the necessaries of life. To make this organization quite omnipotent the Government was further inspired to entrust it with the distribution of the home-grown food supplies. Resistance to anti-Belgian propaganda would then have been reduced by starvation. This project, however, produced such a fury of indignation throughout the country that the foreign legations were moved to protest and succeeded in preventing its realization. The true rôle of the *Volksopbeuring* had become so flagrantly apparent that in 1918 it was disavowed by the Dutch committee which had been formed to support it.

The Economic Situation.—The occupation of Belgium by the German army profoundly disturbed the country's economic situation. Industry suffered from the very outset, owing to the measures taken for military reasons. Raw materials were at once requisitioned, and to facilitate that the declaration of stocks was made obligatory, while they might not be disposed of without permission. In Dec. 1914 the declaration was made obligatory of stocks of benzine, petrol, alcohol, glycerine, oils, fats, carbides, india rubber and pneumatic motor tires. On Jan. 25 1915 this order was extended to stocks of lead, copper, aluminium, antimony, zinc, nickel, mercury, tin and alloys of metals.

Besides requisitions, other measures threatened and destroyed Belgian industry. On Nov. 26 1914 commissaries had been appointed by the German Government to supervise industrial or business concerns belonging wholly or in part to nationals of countries at war with Germany. On Feb. 17 1915 this supervision was changed into sequestration. All such undertakings, whether Belgian or foreign, were sequestrated if they could be useful to Germany or if they might be harmful to her. They were temporarily taken out of the hands of their proprietors and their management assumed by the government of occupation, which either continued to work them in the interests of Germany, or proceeded to liquidate them. Over 100 industrial concerns were sequestrated in 1915, about 20 in 1916, about 10 in 1917. They were great metallurgical works, building works, stone quarries, collieries, electrical generating stations, etc. Foreign undertakings, principally British ones, were put into liquidation.

The establishment of central depots for the monopoly of coal, oils, fats, water, gas and electricity completed the capture of Belgian industry by the invader. In Oct. 1914 the Belgian collieries resumed work. On April 24 1915 the government of occupation established the *Kohlenzentrale*. Collieries had to send their entire output to the "Central," excepting only what was consumed in their own works. Contracts for deliveries existing at the moment of the publication of the edict were annulled. The *Kohlenzentrale* was intended to provide coal for the railways and the German army. This object rapidly expanded, and the "Central" became an instrument of official pillage.

The obligation to declare stocks was imposed simply to facilitate requisitions. In Oct. 1914 Germany introduced into Belgium a double system of requisitions: on the one hand, requisitions made directly for the army and the military authorities; on the other hand, general requisitions. The scheme for working them had been framed by Dr. Rathenau, who was entrusted with the creation of the "Department of raw materials of war" at the War Office in Berlin. Such raw materials were first seized, and could no longer be sold save to the "Centrals" which fixed their price. If the vendor refused the price offered he was expropriated, and handed a requisition voucher. From 1915 onward requisitions of raw materials and of machine tools were made throughout the country. Belgian industries, deprived of raw materials, protested vehemently to the government of occupation that the requisitions should at least be paid for. They were told in reply that if the war tax of 60 millions per month was regularly paid, the price of requisitions would be paid in cash from Jan. 1 1915. This promise was never fulfilled, a thousand pretexts for delaying the payments being offered: difficulties in transporting and classifying the goods, and in checking the requisition vouchers; disproportion between claimed value and the real value; the necessity of not allowing German specie to leave Germany. Moreover, Germany never regarded herself as responsible for the price of the requisitioned goods;

she said they would be paid for by Belgium after the war. The impossibility, however, for Belgian industry to go on without capital obliged the governor-general to seek some solution. On April 2 1915 a *Caisse de prêts* (loan bank) was established at Brussels to make advances on the security of the requisition vouchers. For requisitions made by the army, prices were fixed by the military authorities; for other requisitions valuation was made by the indemnity office in Berlin. The *Caisse de prêts* might advance 75% of such valuation, if the claimant accepted the price offered. The *Caisse de prêts* merely gave a voucher, which the Société Générale de Belgique was required to cash; the latter in return being granted by the Reichsbank a credit equal to the sums disbursed, but not to be drawn upon until three months after the signature of peace. The Société Générale vigorously resisted this measure: on the one hand, because the payment of the enormous number of German requisition vouchers must produce an inflation of the fiduciary circulation, with the immediate result of raising the cost of living and increasing poverty; on the other hand, because the Société Générale objected to helping Germany in her requisitions. The Société Générale never consented to cash any vouchers save those issued for requisitions of raw materials. As claimants usually refused to accept the prices fixed by Berlin, the total of the loans granted did not exceed 75 millions of marks.

Requisitions were not confined to industry alone. In all private houses objects of copper, bronze, metal alloys and wool mattresses were seized. The following table shows the requisitions made in the area of General Government during the second half of 1917:—

Objects.	Quantity requisitioned during second half of 1917.
Copper and alloyed metals from private houses	2,069,300 kgm.
Copper from industrial establishments	3,975,800 "
Zinc	38,870,854 "
Lead	3,967,970 "
Tin	6,600 "
Steel	21,000 "
Iron from demolitions	140,000,000 "
Copper	5,576,375 "
Sulphate of copper	481,414 "
Lead (different forms)	12,309,842 "
Rough zinc	6,225,147 "
Cadmium	768 "
Silver	3,197 "
Chemical products:—	
Sulphuric acid	20,877·7 tons
Soda	6,065·0 "
Chloride of lime	570·0 "
Muriatic acid	886·5 "
Paper	270·0 "
Skins of large cattle	151,664 pieces
" " calves	60,624 "
" " horses	12,868 "
" " sheep	27,710 "
" " various animals	173,710 "
" " rabbits	1,227,819 "
Tanning-materials	4,987,000 kgm.
Leather and leather straps	(value of 4,915,000 mk.)
Boots and shoes	(" " 4,251,955 ")
" " " wooden soled	(" " 79,948 ")
Osier (wicker) for munition baskets	800 tons
Osier fibre	165 "
Wool and hair	840,270 kgm.
Mattress wool	831,685 "
Wool yarn	200,273 "
Woollen rags	1,748,261 "
Cotton rags	5,009,772 "
Manufactured cottons	301,032 "
Cotton and cotton thread	3,152 "
Cottons, confiscated, various	36,694 "
Manufactured flax and products	224,014 "
Hemps and jute	5,748 "
Coconuts and piassava	150,112 "
Brushes	916,333 pieces
Strings	171,119 kgm.
Transmission cables	8,424 "
Jute bags	574,173 pieces

Up to June 1918 there had been requisitioned:—

290,000 tons of iron
7,000 " " copper from factories
3,500 " " " " private houses
9,500 " " copper produced in Belgium
7,000 " " lead
24,000 " " " in different forms, produced in Belgium
35,000 " " zinc

and also 8,550,330 marks worth of leather and leather straps.

Producers were obliged to deliver their total output to the "Central" at very low prices. The "Central," after having supplied the army and the railways, resold the surplus at very high prices to the factories which were authorized to work. Two offices for the distribution of coal to the Belgian population were established at Brussels and Namur, but the quantity allotted for this purpose was quite insufficient. Indeed, the *Kohlenzentrale* tried to export as much coal as possible to neutral countries, for the sake of the large profits realized in that way.

In 1915 the export of Belgian coal to Germany reached 115% of the pre-war figure, in 1916 95%, in 1917 25%. Germany, on her side, imported approximately equivalent amounts of coal into Belgium.

The export to neutral countries was much greater, being in 1915 190% of the pre-war figure, in 1916 230%, in 1917 falling to 90%. The exportation of Belgian coal seemed to Germany a lucrative operation. At the meeting of the Economic Commission on June 19 1915 Kardoff, representing German trade, declared:—"The coal production of Belgium must first supply military requirements and afterwards Belgian consumption. The surplus must serve German purposes, notably as an export to neutral countries." This was the accepted doctrine.

In 1917 the distribution of Belgian coal was as follows:—

	1st quarter.	2nd quarter.	3rd quarter.	4th quarter.
Belgian population and authorized industries	53·0%	43·50%	44·50%	46%
Troops and railways	37·5%	47·50%	49·75%	52%
Occupied French territories	0·5%	0·25%	.	.
Export	9·0%	8·75%	5·75%	2%

Military needs absorbed 4,665,075 tons, one-half of the total output. Thanks to the *Kohlenzentrale's* monopoly, the profits realized by it were large. The figures are as follows:—

Profit on sales.	1915 marks.	1916 marks.	1917 marks.
In Germany	972	48,619	176,110
" Switzerland	340,892	5,856,376	3,498,449
" Scandinavia	1,688,646	10,547,467	2,557,033
" Holland	705,603	5,542,120	2,956,870

The total profits for the three years amounted to about 34 millions of marks, which were used as a German war loan.

An oil "Central" on the same model was established on June 3 1915. It realized a profit of 11,815,266 francs in the years 1915, 1916, 1917; 6·5 millions of which were for 1917 alone. Finally, on July 26 1915 the "Central" for water, gas and electricity was instituted, important services thus being placed under the direct control of the German administration.

The German Government now controlled all the elements indispensable to industry. Henceforth no undertaking could escape its power. Industry was forced into absolute submission to the terms imposed by the invader.

The Belgian marine export trade had, of course, been stopped by the war. Belgian factories closed down one after the other and the numbers of unemployed quickly became enormous. The *Comité National,* whose activities will be described later, organized relief measures, got work of public utility started, and established *bourses de travail* (labour scholarships), which, while supporting the unemployed person, exacted meantime his attendance at technical classes. The German authorities intervened in 1915 and opposed this great organization for assisting the unemployed.

It was soon realized that the only efficacious method of helping the Belgian masses was to revive trade, and in Aug. 1915 a

Comité Industriel was formed for that object. It entered into negotiations with the Allied Governments in order to obtain permission to import raw materials into Belgium—such raw materials, once manufactured, to be reëxported and the proceeds realized applied to the purchase of foodstuffs necessary for the victualling of the Belgian population. The Allies were willing to agree to such an arrangement, but the German Government made the condition that payments for the exported goods should be deposited in a Belgian bank. England declared that she could not accept such a condition, which would have meant that the Allied Powers would be helping Germany, so the *Comité Industriel* dissolved without having achieved anything.

The numbers of the unemployed became daily more alarming. In 1916 they reached 650,000. On Oct. 16 1916 the *Comité National* made a fresh attempt to revive trade, proposing the authorization of exports, their proceeds to be handed to the Commission for Relief in Belgium as payment for food sent in return. Germany refused consent. Part of Belgian industry still remained active but the factories sequestrated by the enemy had great difficulty in finding labour, considerable numbers of the working-classes obstinately refusing to work in the interests of Germany. On Aug. 14 and 15 1915 appeared the first edicts instituting severe penalties for those refusing to undertake work for the German authorities.

The government of occupation was also undermining Belgian industries by requisitions of machinery and tools. Commissions of German engineers and heads of industry were sent into Belgium to seize from Belgian factories any machinery which could be utilized in Germany. The real object was to destroy Belgium's trade, as being a dangerous rival to that of Germany. Pure vandalism characterized these requisitions, the experts even destroying machinery which they found it impossible to remove.

Again official orders of Jan. 10 and Oct. 10 1916 forbade more than 24 hours work per week in the textile and boot-making trades; and those of Feb. 17 and July 21 1917 forbade work in all workshops and factories of Belgium save by authorization of the president of the civil administration.

The working-class population of Belgium was reduced to beggary. The masses of unemployed became more and more numerous. Germany desired them more numerous still. Public works started by provinces and communes to provide employment were suddenly prohibited. Germany exposed her hand.

The president of the civil administration expounded the German theory in a speech delivered before the *députation permanente* of Luxemburg. Relief of the unemployed, he said, was inadmissible in the case of persons deprived of work by the German regulations. Workers aged from 18 to 50 could go to Alsace-Lorraine or Germany, and work there for good wages. If able-bodied members of the working-class would consent to go to Germany, communes would be once more authorized to provide public work for the unemployed of under 18 or over 50.

Thus, by means of a skilfully planned series of edicts, Germany had attained her object—had completely ruined Belgian industry and had created an unemployed class of nearly 700,000 workers, whom she forbade the public bodies to provide with work. Nothing remained but to transport this potential labour into Germany.

From 1917 onwards Belgian industry was subjected to systematic destruction. By June 30 1918, 167 factories had been completely destroyed, 161 factories were mentioned by the administrative report to the governor-general of the section for commerce and industry as to be destroyed immediately, 93 large halls were being demolished, others had been cleared out, 52 halls were to suffer the same fate. Of the 57 high furnaces existing in Belgium, 26 had been razed to the ground, 20 were seriously damaged, 11 only remained fit for use.

The *Service de Récuperation Industrielle* subsequently identified in Germany 24,308 Belgian machines and 89,635,640 kgm. of various kinds of plant. Machinery that could not be carried away entire, had been broken up by hammer blows and the pieces sent to Germany; 290,000 tons of iron, 7,000 tons of lead (coming chiefly from the storing chambers for sulphuric acid) had been taken from the factories.

Metallurgical works, textile factories, chemical works, quarries (save those requisitioned by Germany), cemeteries, gun-foundries, works of public bodies—all were completely despoiled. The collieries alone, being indispensable to Germany, were spared. But when the German army was in final retreat measures were taken to destroy the mines completely. On Oct. 26 1918 orders were given for work to cease in the coal-fields of Hainault. On Nov. 1 pits and machinery were mined, pumping and ventilation were stopped, boiler furnaces extinguished. This would have meant the putting of Belgian mines out of action for years. In face of such an act of vandalism the neutral Powers protested, threatening Germany with economic reprisals, whereupon pumping was recommenced, and the pits and machinery were spared.

In all this policy of destruction Germany had a double aim. On the one hand, she was ruining Belgian trade and eliminating future rivalry from that quarter; on the other hand, unemployment was being daily increased, hundreds of thousands were being thrown out of work, and she was provided with a pretext for requisitioning human labour as she had already requisitioned raw materials and machinery. A series of edicts now prepared for that.

The Deportations.—In Oct. 1916 the military authorities made the first requisition of men for work in Germany. At that time nearly a million persons were in receipt of public relief in Belgium. In Nov. burgomasters were ordered under heavy penalties to furnish the German authorities with lists of the unemployed receiving relief in their communes. In every case the enemy Government was met by refusal on the part of the communal authorities. The military authorities thereupon began a general requisition of able-bodied men throughout the country, whether unemployed or not. Notices posted in the communes ordered all men aged from 17 to 60 to present themselves at the *Kommandantur* in the town of the *arrondissement*. There the assembled men were paraded within double lines of infantry and cavalry. Non-commissioned officers next proceeded to designate those who were to be deported to Germany or to the zones of the front. These unlucky ones were immediately marched to the nearest station, put on a train, and sent under guard to Germany.

Generally speaking, the inhabitants of Flanders—the *zone d'étape*—were sent to the Yser front or to that in the north of France. They were set to work constructing railways, repairing roads, or digging trenches in the zone of fire. Many of them were killed by the Allied bombardment. Workers requisitioned from other parts of the country were concentrated in great camps at Münster, Altengrabow, Guben, Cassel, Meschede, Soltau and Wittenberg. They were ordered to sign labour contracts, and their obstinate resistance was met by the most inhuman methods of intimidation and coercion. Deprived of food, beaten—even with blows of the bayonet—left tied to posts in the snow for entire nights, numbers of them yet perished rather than work for the enemy. In the camps the "purveyors of men" came to take delivery of the human merchandise allotted to them, and distributed it to farms, factories and mines throughout Germany. The invincibly recalcitrant were sent to *Strafbataillonen* at the front, where they were treated like convicts. Such camps, that at Sedan for instance, were responsible for many victims. From time to time convoys of sick were sent back to Belgium; the lamentable state in which they arrived provoked a great protest movement through all the country.

The first voice to make itself heard was that of Cardinal Mercier, Archbishop of Malines. He addressed a protest to the governor-general against the inhumanity of the deportations. In particular he said: "I will not believe that the imperial authorities have said their last word. They will consider our unmerited sufferings, the reprobation of the civilized world, the judgment of history, the chastisement of God." On Nov. 9 1916 the members of the Belgian Parliament in their turn addressed a courageous protest to von Bissing and appealed to the neutral legations. On Dec. 16 the magistracy in its turn protested. In

Nov. Senator Magnette, Grand Master of Belgian Freemasonry, addressed a letter to German Freemasonry, in which he wrote: "The brutal and total suppression of personal liberty, a repetition of the most painful wanderings of Jewish history, the captivity of an entire innocent nation, which for over two years has given an example of marvellous calm, dignity, and patriotism—does not all this cry for vengeance, are you going to disregard it?" German Freemasonry made no reply, but M. Magnette was arrested and imprisoned.

The censorship prevented publication of these numerous protests, which would have encouraged national resistance. Cardinal Mercier determined to address the nation from the pulpit of Ste. Gudule, the cathedral of Brussels. There, on Nov. 26, he addressed the faithful, lashing with burning words the inhumanity of Germany, and exhorting Belgians to stand fast in resistance, in patriotism and in faith in their ultimate victory. The vast throng of his hearers received these words with indescribable enthusiasm.

Finally, on Feb. 14 1917, the most important members of the clergy, the *Comité National*, Parliament, the magistracy, the bar, the nobility, financial circles, etc., addressed the German Emperor in a letter at once dignified and firm, demanding the repatriation of the deported Belgians. The foreign legations still at Brussels—those of the United States, Spain, and Holland—also showed sympathy. Cardinal Mercier had appealed to the Pope, and on Nov. 29 1916 the Pope had approached the German Government on behalf of the victims of deportation, but without effect. The United States now protested to Berlin against such violations of the principles of the Hague Convention, and the Dutch legation did the same. At the time of the fall of Antwerp in 1914 the inhabitants of that town, terrified by the massacres of Visé, Dinant, Andenne, Termonde, Tamenes, Aerschot and Louvain, had fled *en masse* into Holland. The German Government had requested the Dutch Government to assure the Belgian refugees that if they returned to their country they would not be subjected by Germany to requisitions or any other molestation. On the representations of Holland the people of Antwerp returned to Belgium. Germany had now taken thousands of men from among them for deportation, and Holland could not but protest against such disloyalty to promises made to her. These interventions also remained without result, but at last the insistence of Spain, the country which was protecting Belgian interests in Germany, succeeded after a preliminary repulse in obtaining a compromise from the German Government. The Marquis of Villalobar, Spanish Minister at Brussels, proposed an arrangement by which Germany should engage not to deport more than 250,000 men, who should be chosen from the unemployed, to allow those of the already deported who possessed means of existence to return to their homes; to permit deported Belgians to correspond with their families and send them money; and finally, to place Belgian workers in Germany under neutral surveillance. Germany agreed to all these conditions except the last.

The neutral legations next intervened to effect the transmission to the governor general of claims from families whose deported members should, by the terms of the above convention, be authorized to return to Belgium. These claims were numerous; in one month the Dutch legation received 33,000 for transmission.

The deportation policy had proved a disappointment to Germany. The exiles refused to work, and, when forced into a semblance of submission, met coercion with an inertia which rendered their labour valueless. The whole world's indignation at this return to slavery seemed to decide Germany on a movement of clemency. In reply to the letter of Feb. 14 from distinguished Belgians the Emperor announced that he would examine the matter with benevolence. It was speedily decided that the victims of deportation should be repatriated on June 1 1917, and Germany published this decision far and wide. It proved but a piece of abominable treachery. Numerous convoys of the deported did indeed return to Belgium, but soon after they were again summoned to the *Kommandantur*, and, under pain of being deported anew, were forced to accept work in the requisitioned Belgian factories. Moreover, the authorities declared that the Emperor had not promised that Belgian workmen should not be deported into France, and many of the convoys which arrived from Germany were immediately sent off to the invaded French departments. A yet more hypocritical construction was put on William II.'s words. He had promised the repatriation of the deported Belgians, but once repatriated there was nothing against their being deported a second time as unemployed. So the deportation began again, only to be ended by the Armistice.

Statistics of the Deportations.

Deported into Germany.

Total number	Age 18.	Age 18–50.	Age 50–60.	Age 60–70.	Age over 70.
57,718	3,412	53,485	807	9	5

Died during deportation in Germany: 1,304.

Deported to the *Zivil Arbeiterbataillonen* at the front.

Total number.	Age 18.	Age 18–50.	Age 50–60.	Age 60–70.	Age over 70.
57,541	5,118	51,281	1,080	59	3

Died during deportation at the front: 1,227.
Total number deported: 115,259.
Total of deaths resulting from bad treatment: 2,531.

Feeding the Belgian Population.—Belgium could not feed her population unaided. She did not produce above a quarter of her wheat consumption. Thus as early as Aug. 14 1914 the Belgian Government had rationed bread. By Nov. scarcity was being felt in Hainault; and in the following month the provinces of Limburg and Luxemburg and all the towns were short of flour, while the rural districts lacked coffee, salt, yeast, coal, petrol and soap. Prices began to rise sharply. The situation was the more critical because, the country once occupied, the German governor had abrogated all measures already taken by the Belgian Government to ensure its food supplies. The public administrative bodies could no longer act; private initiative had to take their place. Everywhere committees were formed. At Antwerp a *Comité de secours* collected 2,000,000 francs for organizing relief to the necessitous; while a *Comité de ravitaillement*, formed by the communal authorities and including in its sphere of action the 82 communes of the fortified area, secured 10,000 tons of wheat, bacon and lard, 2,000 head of cattle, and 2,000 pigs. At Liége a *Comité d'alimentation* was formed to manage the provisioning of 23 communes. At Brussels the *Comité de secours du Luxembourg* endeavoured to succour those left homeless by the burnings and devastations of the German army. At Bruges and Ostend committees were formed to purchase wheat. Everywhere such organizations appeared, but they were impotent to save the country from the famine which menaced it, for the German Government, in order to exercise pressure on the Allies, declared

Comité Industriel was formed for that object. It entered into negotiations with the Allied Governments in order to obtain permission to import raw materials into Belgium—such raw materials, once manufactured, to be reëxported and the proceeds realized applied to the purchase of foodstuffs necessary for the victualling of the Belgian population. The Allies were willing to agree to such an arrangement, but the German Government made the condition that payments for the exported goods should be deposited in a Belgian bank. England declared that she could not accept such a condition, which would have meant that the Allied Powers would be helping Germany, so the *Comité Industriel* dissolved without having achieved anything.

The numbers of the unemployed became daily more alarming. In 1916 they reached 650,000. On Oct. 16 1916 the *Comité National* made a fresh attempt to revive trade, proposing the authorization of exports, their proceeds to be handed to the Commission for Relief in Belgium as payment for food sent in return. Germany refused consent. Part of Belgian industry still remained active but the factories sequestrated by the enemy had great difficulty in finding labour, considerable numbers of the working-classes obstinately refusing to work in the interests of Germany. On Aug. 14 and 15 1915 appeared the first edicts instituting severe penalties for those refusing to undertake work for the German authorities.

The government of occupation was also undermining Belgian industries by requisitions of machinery and tools. Commissions of German engineers and heads of industry were sent into Belgium to seize from Belgian factories any machinery which could be utilized in Germany. The real object was to destroy Belgium's trade, as being a dangerous rival to that of Germany. Pure vandalism characterized these requisitions, the experts even destroying machinery which they found it impossible to remove.

Again official orders of Jan. 10 and Oct. 10 1916 forbade more than 24 hours work per week in the textile and boot-making trades; and those of Feb. 17 and July 21 1917 forbade work in all workshops and factories of Belgium save by authorization of the president of the civil administration.

The working-class population of Belgium was reduced to beggary. The masses of unemployed became more and more numerous. Germany desired them more numerous still. Public works started by provinces and communes to provide employment were suddenly prohibited. Germany exposed her hand.

The president of the civil administration expounded the German theory in a speech delivered before the *députation permanente* of Luxemburg. Relief of the unemployed, he said, was inadmissible in the case of persons deprived of work by the German regulations. Workers aged from 18 to 50 could go to Alsace-Lorraine or Germany, and work there for good wages. If able-bodied members of the working-class would consent to go to Germany, communes would be once more authorized to provide public work for the unemployed of under 18 or over 50.

Thus, by means of a skilfully planned series of edicts, Germany had attained her object—had completely ruined Belgian industry and had created an unemployed class of nearly 700,000 workers, whom she forbade the public bodies to provide with work. Nothing remained but to transport this potential labour into Germany.

From 1917 onwards Belgian industry was subjected to systematic destruction. By June 30 1918, 167 factories had been completely destroyed, 161 factories were mentioned by the administrative report to the governor-general of the section for commerce and industry as to be destroyed immediately, 93 large halls were being demolished, others had been cleared out, 52 halls were to suffer the same fate. Of the 57 high furnaces existing in Belgium, 26 had been razed to the ground, 20 were seriously damaged, 11 only remained fit for use.

The *Service de Récuperation Industrielle* subsequently identified in Germany 24,308 Belgian machines and 89,635,640 kgm. of various kinds of plant. Machinery that could not be carried away entire, had been broken up by hammer blows and the pieces sent to Germany; 290,000 tons of iron, 7,000 tons of lead (coming chiefly from the storing chambers for sulphuric acid) had been taken from the factories.

Metallurgical works, textile factories, chemical works, quarries (save those requisitioned by Germany), cemeteries, gun-foundries, works of public bodies—all were completely despoiled. The collieries alone, being indispensable to Germany, were spared. But when the German army was in final retreat measures were taken to destroy the mines completely. On Oct. 26 1918 orders were given for work to cease in the coal-fields of Hainault. On Nov. 1 pits and machinery were mined, pumping and ventilation were stopped, boiler furnaces extinguished. This would have meant the putting of Belgian mines out of action for years. In face of such an act of vandalism the neutral Powers protested, threatening Germany with economic reprisals, whereupon pumping was recommenced, and the pits and machinery were spared.

In all this policy of destruction Germany had a double aim. On the one hand, she was ruining Belgian trade and eliminating future rivalry from that quarter; on the other hand, unemployment was being daily increased, hundreds of thousands were being thrown out of work, and she was provided with a pretext for requisitioning human labour as she had already requisitioned raw materials and machinery. A series of edicts now prepared for that.

The Deportations.—In Oct. 1916 the military authorities made the first requisition of men for work in Germany. At that time nearly a million persons were in receipt of public relief in Belgium. In Nov. burgomasters were ordered under heavy penalties to furnish the German authorities with lists of the unemployed receiving relief in their communes. In every case the enemy Government was met by refusal on the part of the communal authorities. The military authorities thereupon began a general requisition of able-bodied men throughout the country, whether unemployed or not. Notices posted in the communes ordered all men aged from 17 to 60 to present themselves at the *Kommandantur* in the town of the *arrondissement*. There the assembled men were paraded within double lines of infantry and cavalry. Non-commissioned officers next proceeded to designate those who were to be deported to Germany or to the zones of the front. These unlucky ones were immediately marched to the nearest station, put on a train, and sent under guard to Germany.

Generally speaking, the inhabitants of Flanders—the *zone d'étape*—were sent to the Yser front or to that in the north of France. They were set to work constructing railways, repairing roads, or digging trenches in the zone of fire. Many of them were killed by the Allied bombardment. Workers requisitioned from other parts of the country were concentrated in great camps at Münster, Altengrabow, Guben, Cassel, Meschede, Soltau and Wittenberg. They were ordered to sign labour contracts, and their obstinate resistance was met by the most inhuman methods of intimidation and coercion. Deprived of food, beaten—even with blows of the bayonet—left tied to posts in the snow for entire nights, numbers of them yet perished rather than work for the enemy. In the camps the "purveyors of men" came to take delivery of the human merchandise allotted to them, and distributed it to farms, factories and mines throughout Germany. The invincibly recalcitrant were sent to *Strafbataillonen* at the front, where they were treated like convicts. Such camps, that at Sedan for instance, were responsible for many victims. From time to time convoys of sick were sent back to Belgium; the lamentable state in which they arrived provoked a great protest movement through all the country.

The first voice to make itself heard was that of Cardinal Mercier, Archbishop of Malines. He addressed a protest to the governor-general against the inhumanity of the deportations. In particular he said: "I will not believe that the imperial authorities have said their last word. They will consider our unmerited sufferings, the reprobation of the civilized world, the judgment of history, the chastisement of God." On Nov. 9 1916 the members of the Belgian Parliament in their turn addressed a courageous protest to von Bissing and appealed to the neutral legations. On Dec. 16 the magistracy in its turn protested. In

provinces and communes and thus neutral control was eliminated while Germany was enabled to requisition Belgian produce in her own interests. Besides the crops 92,000 horses (out of 317,000), 560,000 head of horned stock (out of 1,879,000), 250,000 pigs (out of 1,404,000), 3,000 sheep, and 1,600,000 fowls were sent to Germany. To stop this England threatened curtailment of the food supplies for Belgium. This serious crisis was averted by the good offices of the C.R.B.

Upon America's entry into the war Mr. Hoover resigned his function on the C.R.B., after three years of devoted work. Holland replaced America, and the *Comité Hispano-Neerlandais* took up the task of the C.R.B.

The Belgian Government during the War.—The gradual occupation of the country by the German army compelled the Belgian Government to retire first to Antwerp, then after the fall of that town to Ostend, finally to Havre. Ministers accredited to the Belgian Government followed it there, except the Spanish Minister, the Marquis of Villalobar; the American Minister, Mr. Brand Whitlock; and the Dutch *chargé d'affaires*, M. van Vollenhoven, subsequently appointed Minister—these three remained in Brussels.

At the time of the Government's removal to France over a million Belgians were fleeing before the German armies to foreign countries: 200,000 took refuge in France, 100,000 in England, 700,000—including nearly the entire population of Antwerp—in Holland. Germany's assurances that Belgians who returned to their country should not be molested brought back the inhabitants of Antwerp, to suffer subsequently from deportations despite the promises of the governor, von der Goltz. Fifty thousand refugees remained in Holland.

The Government at Havre found itself faced by a gigantic task. The army, deprived of bases and depots, was without munitions, food supplies, or clothing. All had to be reorganized. Yet not for one moment were the Belgian field forces withdrawn from the front. To reinforce them the King appealed to Belgians residing abroad, and they formed a first contingent. Thousands of Belgians who had remained at home also responded to the call of their King, and managed to get out of Belgium despite the strictness with which the frontiers were guarded, the high-pressure electric wires separating Belgium from Holland, and the severe penalties decreed against those who joined the Belgian army. On March 1 1915, having succeeded in establishing the necessary centres of instruction, the Government called up all Belgians between the ages of 18 and 25 resident in non-occupied Belgium, in France, or in England. On July 21 1916 all Belgians aged 18 to 40 resident in allied or neutral states were called to the service of their mother-country.

Colleges for officers were established in France—at Gaillon and Bayeux for infantry; at Onival for artillery; at Campagne for cavalry; at Ardres for engineers. Centres of infantry instruction were established at Parigné Lévêque, Auvoury, Honfleur, Granville, Saint Lo, Coutances, Carteret, Barneville, Valogne, La Haye-du-Puits. The artillery instruction centre was at Eu, that for auxiliary troops at Buchard.

On March 16 1915 a royal decree ordered the creation of building and repairing workshops, munitions factories, foundries, farrieries, storehouses, etc. Huge establishments improvised at Havre provided the army with all its artillery munitions.

Hospitals capable of accommodating all the Belgian wounded were provided at the front. A school of reëducation for the mutilated was established at Vernon. Belgian schools were started in France, England, and Holland. Necessitous refugees were helped.

Thanks to unremitting efforts the army was kept up at an effective average of 150,000 strong, and the field army at 75,000.

III. After The War.—When the offensive of 1918 brought liberation to Belgium the work of restoration to be accomplished was enormous. The Treaty of Versailles did not facilitate it. Shut out from the deliberations of the Supreme Council, Belgium could neither claim her rights nor defend her interests as, if represented, she would have been able to do.

For Belgium the most important question raised by the war was the revision of the treaties of 1839. Those treaties had fixed the international status of the country by declaring it neutral in perpetuity under guarantee of the Powers. They had moreover mutilated Belgium by taking from her the half of Limburg with Maestricht, and giving it to Holland, and the half of Luxemburg, which was created a grand duchy. This mutilation gave Belgium frontiers impossible to defend—Maestricht forming a bridge-head on the Meuse, which was the country's natural line of defence. There was, further, pressing for settlement, the question of the Scheldt, that essential organ of Belgium's economic life; its estuary was in the possession of Holland, who could thus control the economic and military fate of Antwerp.

Nothing was done. Rather than take from Germany the ancient Dutch provinces of Guelders and Cleves, which would have served as territory to exchange for the cession of Limburg to Belgium, the Treaty of Versailles prevented a political and military solution of the Limburg question; while Holland on her side refused to solve it by a treaty of common defence between Belgium and the Netherlands. The grand duchy of Luxemburg was the object of French designs, which prevented its restitution to the mother-country. The question of the Scheldt was left hung up. Belgium only obtained two of the 14 Walloon cantons incorporated in Prussia in 1815—Malmedy and Eupen. She was also given the right to connect Antwerp with the Rhine by a canal.

As regarded finance, Belgium was relieved of her war debts (six milliards) to the Allies, who declared Germany responsible for them. Priority was granted to Belgium for a payment of 2·5 milliards from the German indemnity, this representing the reimbursement of 2·5 milliards extorted from her by Germany under the designation of war tax.

Belgium was left to seek unaided a solution to the grave problems which beset her. She entered on negotiations with Holland. These were going badly for Belgium; it seemed likely that the Scheldt would remain in Holland's possession, and that the defence of the eastern frontier would continue to be an insoluble problem, when Holland put forward a claim for recognition of her sovereignty over the pass of Weilingen—that is to say, over Belgian territorial waters from the Dutch frontier to beyond Zeebrugge. This manoeuvre—made possible by the isolation in which the Allies had left Belgium, and by the favour shown by England to Holland's doctrine that the Scheldt should be closed to Belgian warships—had for object, and would have entailed as consequence, Holland's right to deny Belgium access to the port of Zeebrugge, which would have meant that she was completely cut off from the sea. The general movement of protest throughout Belgium against the signature of such a Dutch-Belgian treaty compelled the Government to break off negotiations.

In 1918 Belgium joined with France in a treaty of defensive alliance, attempts being made to secure England's participation. As a result of negotiation France renounced in favour of Belgium her economic union with the grand duchy of Luxemburg.

As regarded Africa, Belgium did not succeed in gaining recognition of her rights over the territories conquered by her in German East Africa. Only Urundi and Ruanda were allotted to her; the other territories passed to England.

In the occupation of the Rhine Belgium was represented by a force of 12,000 men.

The Work of Restoration.—Internal problems were very grave. Before all it was necessary to ensure the food supplies of the country. This task was enhanced in difficulty by the fact that private enterprise could not touch it, owing to the sharp fluctuations of the exchange. The State itself was thus forced to purchase abroad the cattle, butter and margarine needed by the population. Maximum prices having proved inefficacious, a number of administrative orders were issued, forbidding speculation in foodstuffs, authorizing the requisition of indigenous products, establishing inspection to prevent vendors from adulterating goods, and repressing excessive prices.

The social situation was terrible. There were 800,000 unemployed; and 2,400,000 persons—a third of the population—only

existed by the aid of public relief. The State had to assume the support of these unemployed masses. Labour exchanges were established to facilitate the distribution of recruits to reviving industry. The vast numbers of the workless might have led to famine wages; to obviate this the State decided that any workmen offered less than the minimum rate of one franc per hour in the towns and 0·75 in the country, might refuse work, while yet continuing to draw out-of-work relief. Workers, moreover, were organizing themselves so as to improve labour conditions. The trade-union movement advanced with enormous strides. In 1919 the number of organized workers had risen to over 600,000, having been only about 200,000 in 1914. Wages, as a matter of fact, never fell below one franc per hour. Industrial workers in general have obtained two francs per hour, metallurgical workers earn 2·25 to 2·50 francs per hour, miners 16 to 20 francs per day.

The astonishingly rapid reconstruction of 2,000 km. of destroyed railway lines, effected by the end of 1919, the renewed activity of the collieries, which in the first quarter of 1919 produced 8·5 million tons of coal (against 11·5 million tons in 1914), and of the coke furnaces, which in May 1919 produced 58,000 tons (against 245,000 tons in May 1914), helped on the gradual revival of industry.

The *Commission de récupération industrielle* gave a first stimulus to industry by recovering Belgian machinery from Germany, and by 1919 huge orders from English and American firms had restored the country to economic activity. These orders were made possible by credits opened to Belgian industry by the banks. After the war the banks had indeed become of capital importance. The 13 principal banks of Belgium increased their capital by 380,000,000 francs.

In Dec. 1919 the output of the mines reached 81·3% of the pre-war output. The coal-fields of Limburg were becoming active; in 1919 the Winterslag mine began work, producing 500 to 600 tons per day, in 1920 a second mine was opened. The metallurgical industry achieved 20% of its 1913 output of cast iron, and 40% of steel and finished iron.

Alimentary industries, the building trade, industries of art and precision, were now employing 75% of their pre-war staffs, glass-making 80%, mines and transport over 100%, chemical industries, ceramics, paper-making, linen-weaving, tobacco manufacture 70%, clothing 87%, metallurgy 64%, the timber trade and furniture-making 66%.

Such a revival, effectuating itself in the midst of the gravest economic difficulties, could not but raise one problem after another. Questions of wages and of hours of labour were continually endangering relations between employer and employed. Thanks to a policy of foresight and moderation the Government managed to avert most of the conflicts. In April 1919 two commissions were appointed to inquire into the possibility of reducing hours of labour in steel manufactories and in mines. The principle of the 8-hour day was admitted. On June 1 1919 work was reduced to 8½ hours per day, on Dec. 1 to 8 hours per day

In June another commission took up the same question for mechanical construction. Later, national councils were appointed for the public services of gas and electricity, for ice factories, the building trade, the timber trade, and furniture-making, glass-making, the textile trade of Flanders, and the port of Antwerp. The committees, presided over by officials, and composed of employers and employed in equal numbers, discussed questions of wages and conditions of work. They often passed resolutions constituting actual collective contracts, in some cases they proceeded to codify their decisions. They settled many local disputes, and checked movements dangerous to national life. The law does not enter into either their constitution or their functions; they have no means of enforcing their decisions other than the appeal to public opinion; yet there had not been one instance up to 1921 where resolutions passed by the committees had not been loyally applied. Employers and employed found in these bodies a means of discussing and solving problems which formerly would have been met by a strike. The establishment of these committees marks an interesting tendency towards the decentralization of economic legislation, towards a professional organization quite outside political parties, towards the assumption by the worker of his share in the solution of industrial problems.

Since the war, as a general rule, wages had risen considerably, with a tendency towards uniformity and towards their fixation according to index numbers published by the Government. In Dec. 1919 the index number was 359 relatively to the month of April 1914.

Belgium's resumption of commerce after the war is shown in the following table in which the imports for 1919 and the exports for 1919 and 1920, from and to the chief regions in question, are shown.

	Imports 1910.		*Exports.*	
	Tons.	Thousands of francs.	1919 (tons.)	1920 (tons.)
Germany	1,550,142	659,921	191,032	471,883
France	2,087,273	1,850,476	2,213,875	3,885,704
England	1,805,573	1,087,474	166,333	685,701
Holland	623,868	585,098	1,931,946	1,491,553
United States	900,804	1,517,808	223,364	317,961
Argentina	394,165	519,954	5,044	52,656
Congo	12,251	87,327	18,107	21,342

These figures show the war's disastrous effect on Belgian commerce. In 1914 exports and imports were fairly equivalent. In 1915 imports exceeded exports by about three milliards of francs. In 1920, it is true, the export trade to the seven countries named above began to revive, improving from 4,749,701 tons to 6,926,800 tons. But trade was involved in the gravest difficulties. Markets had been captured during the war by England and the United States. France's protectionist tendencies and Germany's easy rivalry in foreign markets owing to the depreciation of her exchange were also causes of the serious commercial crisis that Belgium was passing through in 1920–1.

The resurrection of the port of Antwerp was rapid. In 1919 4,820 vessels, registering 5,245,048 tons, entered the port; in 1920 7,098 registering 10,852,341 tons (in the same year Rotterdam received 5,951 registering 7,609,777 tons). Antwerp's development is closely linked with Belgium's prosperity. The port's connexion with the Rhine by means of a ship canal was in 1921 under consideration.

Belgium made great efforts to develop her commercial marine. The Lloyd Royal Belge, entirely promoted by Belgian capital, was formed to add to the Red Star Line's already existing service between Antwerp and America regular services to Brazil, the British West Indies, the Far East, Australia, Spain, Italy and the Near East.

But though Belgian commerce and industry were showing their powers of rapid recuperation, the country's financial situation could not but be serious. Scarcely was it back in Belgium when the Government had to face the cost of redeeming the marks put in circulation by Germany; the amount represented 7·5 milliards of francs. Other heavy charges upon State finances were: the payment of arrears of salary due to officials; the augmentation of salaries necessitated by the enormously increased cost of living; the expenses of victualling the country and of reconstructing railways, canals and roads; the sums voted for compensation to industrial concerns and private persons for war damage and destruction.

In 1919 the national debt amounted to 12,064,050,000 francs; in 1920 it was over 30 milliards. To meet a situation of such gravity new taxes had to be imposed. The income tax established by vote on Oct. 21 1919 took 10% on unearned incomes, and a graded percentage on earned incomes which only reached 10% when such an income was over 48,000 francs.

On Oct. 11 1919 a new law of inheritance imposed a tax varying with the heir's degree of kinship to the deceased from 1 to 50% upon the sum inherited; while inheritance from an intestate was suppressed in favour of the State beyond the fourth degree of kinship. New taxes fell on beer, tobacco, alcohol, and cinemas. On March 3 1919 war profits were taxed progressively up to 10% and railway fares were doubled.

Despite these efforts it was obvious that the Belgian budget could not be restored to financial equilibrium save by Germany's payment of the war indemnity. In order to have some guarantee of that indemnity the Government, on Nov. 10 1918, placed under sequestration all property belonging to subjects of the enemy countries. The chief item of expense was the indemnification of war damage, estimated at over 35 milliards. The State supported the formation of coöperative societies, advancing to persons who had suffered war damage up to 70 to 95% of the compensation due to them, and the creation of the Crédit National Industriel, also supported by the Banque Nationale, and serving as intermediary between the State and the claimants. To provide the advances these organizations issued 5% bonds guaranteed by the State up to the value of the compensation for damages. Thus the debt was brought into the hands of several groups, which should greatly facilitate its liquidation.

The work of national reconstruction was being accomplished up to 1921 amid political and social calm. After the Armistice the Government was composed of ministers belonging to the three great parties. All political strife had ceased, a truce having been brought about by mutual concessions. Universal suffrage " pure and simple " at 21 years of age was established at the demand of the Socialist party. As compensation the Catholic party claimed votes for women, which the Chamber conceded for communal elections but not for parliamentary elections. The elections of Nov. 16 1919, with universal suffrage at 21, deprived the Catholic party of the majority it had enjoyed since 1884, while the Socialists gained considerably.

Thanks to this political calm, Parliament was able to introduce such important reforms as the income tax, and the prohibition of the sale of alcohol in public (law of Aug. 20 1919).

The only disturbing elements in Belgian public life in 1920–1 was the Activist movement. Promoted by German intrigue during the war, it still existed, making the independence of Flanders its ostensible object. At the last election its candidates only polled 62,000 votes out of 1,757,104 cast, and it was generally condemned by public opinion. The members of the *Raed van Vlaenderen* and certain Activists who had assisted the enemy were convicted of high treason and sentenced, but they had escaped to Holland, where they were well received by both the Government and the public.

Belgium took an honourable part in the proceedings of the League of Nations. Like Brazil, Greece and Spain she was invited to join the Council along with the Great Powers, and her delegate, M. Hymans, was elected president of the first general assembly at Geneva. At that assembly Belgium was reëlected as member of the Council, to sit on it with Brazil, Spain, China, and the Great Powers. With the object of extending Belgian influence abroad, the diplomatic and consular services were completely reorganized. The *Association Internationale des Académies* has chosen Brussels for its centre of activity.

On Aug. 19 1920 the *Académie de la langue française* was inaugurated at Brussels. Dr. Bordet, professor of Brussels University, was awarded the Nobel prize. University life had revived. The civil status granted to the universities of Louvain and Brussels was on July 5 1920 extended to the universities of Ghent and Liége. The profits realized by the C.R.B. were presented by the president, Mr. Hoover, to the Belgian universities. Each of them was the recipient of a donation of 20 million francs, intended to develop the scientific side of their work. Mr. Hoover moreover presented a sum of 80 millions to the *Fondation Universitaire*, the income to be allocated by a committee of university professors to encourage the advance of science in Belgium.

Finally, mention must be made of the reform of justice, the creation of single judge tribunals, reforms in the treatment of prisoners, and the institution of a school of criminology. The Government established a school of agriculture at Ghent, a school of social service, and a colonial school. A commission of inquiry was appointed to investigate the violations of international law committed by the Germans in Belgium. Archives of the war were founded to collect all the documents relative to the history of Belgium from 1914 to 1918.

BELGIAN LITERATURE

It cannot be said that any very extraordinary new talent either in prose or in poetry revealed itself in Belgian French literature between 1910 and 1921.

The fame of Maurice Maeterlinck and Emile Verhaeren remained world-wide. Maeterlinck's play *L'Oiseau Bleu* (1911) was first performed at Moscow, then in London (translated as *The Blue Bird*), and later in Paris and New York. The writer's poetic imagination and serene philosophy contributed to make his play intensely popular. A continuation under the title of *The Betrothal* was produced in London in 1921.

During the war Maeterlinck published, in 1916, a volume of articles he had written in various newspapers and lectures he had delivered in England, France and Italy, under the title of *Les Débris de la Guerre*. He also wrote *L'Hôte Inconnu* (1917), *Le Miracle de St. Antoine* (1919), *Les Sentiers dans la Montagne* (1919) and *Le Bourgmestre de Stilemonde* (1920), a play dealing with the horrors of the German invasion in Belgium.

Emile Verhaeren's tragedy *Hélène de Sparte* was first published in German, translated by Stephan Zweig, then in Russian, and appeared in French in 1912, when it was performed in Paris. Verhaeren's forcible and rather rugged style is perhaps not absolutely suited to the subject he treats. His poems, however, *Les Rythmes Souverains* (1910), *Les Villes à Pignons* (1910), *Les Fleurs du Soir* (1911), *Les Plaines* (1911) and *Les Blés Mouvants* (1912), are as intense in feeling and vitality as his earlier work. Verhaeren's accidental death (he was crushed by a train in Rouen station Nov. 26 1916) was a great loss to Belgian literature. *La Belgique Sanglante* (1915), *Parmi les Cendres* (1916), *Villes Meurtries de Belgique* (1916), *Les Ailes Rouges de la Guerre* (1916) have been read and admired all the world over for their ardent patriotism and their righteous indignation as well as for their felicity of expression. These war poems will live wherever the French language is spoken.

In *Les Libertins d'Anvers, Légende et Histoire des Loistes,* Georges Eekhoud has told the story of the heretic sects in Antwerp in the 16th century. In this book Eekhoud, according to his custom, exalts his native city in her vices as well as in her virtues. Other books written by Eekhoud are *Les Peintres Animaliers Belges* (1911), and *L'Imposteur magnanime, Perkin Warbeck* (1914).

A tragedy in four acts by Camille Lemonnier, *Edénie*, set to music by Léon du Bois, was performed in Antwerp in 1912 with great success. The poem, written in blank verse, has all the charm of Lemonnier's vivid imagination and forcible style. Lemonnier died in 1913. His last book, *Au Cœur frais de la Forêt*, was published in 1914.

Albert Giraud's *La Frise Empourprée* (1912) is a collection of poems, in which their author remains faithful to the Parnassian tradition. In 1919 Giraud published a volume of poems, *Le Laurier*, written in Brussels during the war, and in 1920 *Éros et Psyché*.

Ivan Gilkin published in 1911 poems called *La Nuit*, the first of three volumes, of which the others were to be called *L'Aube* and *La Lumière*, and in 1920 a play in blank verse, *Le Roi Cophetua*.

Grégoire Le Roy, in his collection of poems called *Le Rouet et la Besace*, illustrated by himself, deals with the sufferings of the poor. *La Couronne des Soirs* (1911), *Contes d'après Minuit* (1913) and *Joe Trimborn* (1913) are collections of short stories.

Jean Dominique (pseudonym of Mlle. Marie Closset), whose volume of poems, *Le Puits d'Azur*, was published in 1912, is undoubtedly one of the most gifted of contemporary women writers. Mlle. Closset is a teacher and lives in Brussels. Another original and interesting woman writer, Neel Doff, has published *Jours de Famine et Détresse* (1911) and *Contes Farouches* (1913).

A considerable number of books and poems dealing with and inspired by the war were published by Belgian writers in England and France during the war, as well as in Belgium itself after the refugees and soldiers returned home. During the German occupation Belgians had necessarily been debarred from publishing works inspired by their patriotic feelings. Besides Verhaeren's war poems, Emile Cammaerts' *Belgian Poems* (1915) may be mentioned.

Professor Pirenne's *Souvenirs de Captivité en Allemagne* (1920) are a notable contribution to Belgian war literature in prose. An interesting book which consists of a series of essays on the war and the German occupation, *L'Œil sur les Ostrogoths*, by Ernest Verlant, director of Fine Arts, may live as a record of the impressions of a subtle mind and a cultivated personality. A monthly review *Le Flambeau*, published clandestinely in Brussels during the German occupation, by Oscar Grojean, Henri Grégoire and Anatole Muhlstein, a young Pole, and which continues to appear, edited by Grojean and Grégoire, is without doubt the most interesting literary and political review in Belgium. Amongst contemporary writers and poets in Belgium may be mentioned: Fernand Séverin (*La Solitude Heureuse*, 1901); Max Elskamp (*Sous les Tentes de l'Exode*, 1921; *Les Commentaires et l'Idéographie du jeu de Loto dans les Flandres*, 1914); Georges Raemaekers (*Les Saisons Mystiques*, 1910); t'Serstevens (*Un Apostolat*); Blanche Rousseau (*Le Rabaga*, 1912; *Lisette et sa Pantoufle*, 1913); Glesener (*Chronique d'un petit Pays*, 1913).

In 1920 Crommelynck's play *Le Cocu Magnifique* created a sensation in Paris where it had a long run at the Théâtre de l'Œuvre. In Brussels it obtained more or less of a "succès de scandale." It deals with a case of pathological jealousy. Crommelynck's other plays are *Le Sculpteur de Masques* (1908) and *Les Amants Puérils* (1921). Other Belgian plays include *Koatje* and *Malgré Ceux qui tombent*, by Paul Spaak; *Les Étapes*, *Les Liens* and *Les Semailles* (1919) by Gustave van Zype, and *Le Mariage de Mademoiselle Beulemans* by Fonson and Wicheler, a picture of the life of the lower middle class in Brussels.

In Flemish literature there has been marked activity. Stijn Streuvels, a nephew of Guido Gezelle, and by profession a baker at Avelghem, a village in Flanders, has made a considerable reputation both in Belgium and in Holland. His descriptions of rural life are both poetic and realistic, and he has been compared to Tolstoi, whose psychological subtleties and epic amplitude Streuvels however does not possess. His style is of rare perfection, and this remark applies to the whole of the modern Flemish school of writers. Streuvels's work, *Het Glorieryke Licht* (The Glorious Light), was written in 1913. In 1914 he published *Dorpslucht* and in 1920 *Genoveva van Brabant*, a historical novel.

Cyriel Buysse may be called the Flemish Maupassant. He is a realist. His works, which deal with the life of the people both in towns and in the country and, to a lesser degree, with that of the middle classes, form a complete picture of Flemish life. Buysse is passionate, robust, full of revolt and of pity, very human. His *De Vroolyke Thocht* (The Joyous Expedition), *Stemmingen* (Impressions), and in collaboration with Virginie Loveling, a popular woman author, *Levensleer* (Education through Life) appeared between 1910 and 1912. In 1915 Buysse published *Zomerleven* (Life in the Summer), a sort of diary, and in 1921 *Zooals Het Was* (As It Was). Maurice Sabbe's *De Nood der Bariseeles* (The Plight of the Bariseeles), *In 't Gedrang* (1915, a book about the war), and *'t Pastorke van Schaerdycke* (1919, The Little Pastor of Schaerdycke) and E. Vermeulen's *Herwording* (Renaissance), which deals with the life of the peasants in West Flanders, may also be mentioned.

René de Clercq and Karel van de Woestyne are the most typical Flemish poets of the present generation. René de Clercq proceeds directly from the inspiration of Guido Gezelle (1830–89). His poems are essentially popular, vigorous, full of life and good spirits, although through these one feels his tenderness, his pity for the misery of the Flemish peasants. He has published a volume of *Gedichten* (Poems). Karel van de Woestyne has a more complex personality. His poems are very varied in feeling, sometimes simple and direct, at other times complicated, full of metaphors. His sphere is that of the soul, and for him things are real in so far only as they partake of the spiritual life. It is necessary to add that there are contrasts in Van de Woestyne's nature which he does not always dominate, and which give a certain want of harmony to his works. A volume containing prose essays on Flemish painters and writers is *Kunst en Leven in Vlaanderen* (Art and Life in Flanders). A volume of poems is *De Gulden Schaden* (The Golden Shadow). In 1918 Van de Woestyne wrote a book in poetic prose, mystic and difficult, called *De Bestendige Aanwezigheid* (The Eternal Presence), and in 1920 a volume of poems *De Modderen Man* (of which the nearest translation is The Man of Clay), the first volume of a trilogy. A new Belgian Flemish writer of outstanding importance is Felix Timmermans who, before he became celebrated in Belgium and Holland, sold sweets in a little shop in his native town of Lierre. *Pallieter* (1916) is epoch-making in contemporary Belgian literature. It is as forceful as Rabelais and yet tender and poetic, with a pantheistic feeling for nature: the ecstasy of a human being who incorporates himself with woods and streams, flowers and beasts, and who revels in every form of life. One may say that this book takes an important place in European literature. It had already reached 12 editions in 1921, and a French translation was then about to appear. Another book of Timmermans, *Het Kindeken Jesus in Vlaanderen* (1918, The Christ Child in Flanders), is a most poetical transplantation of the story of the childhood of Christ. This has already been done in Belgian French literature by Eugène Demolder. But whereas Demolder's book is full of literary devices Timmermans's comes as it were from the heart of the people. Another Flemish prose writer is Herman Teirlinck: *De nieuwe Uylenspiegel* (1920, The New Eulenspiegel), a fantasy; and amongst the best-known recent poets Auguste van Cauwelaert, Frits Francken and Daan Boens may be mentioned. Cyriel Verschaeve has written a dramatic poem *Judas*, and Eug. Schmidt a play *Het Kindernummer* (a turn performed by a child at a music-hall).

(L. Va.)

BELL, CHARLES FREDERICK MOBERLY (1847–1911), British journalist, was born in Alexandria April 2 1847, the son of a merchant. He was educated in England, but in 1865 went back to Egypt and engaged in business. He soon began sending occasional correspondence to the London *Times*, and from 1875 onwards devoted himself mainly to journalism. By 1880, when he founded the *Egyptian Gazette*, he had become the regular correspondent for *The Times* in Egypt. He also published *Khedives and Pashas* (1884); *Egyptian Finance* (1887) and *From Pharaoh to Fellah* (1888). In 1890 he was summoned to London to take the post of manager (nominally assistant-manager) of *The Times*, at a time when it had suffered heavy financial losses over the proceedings connected with the Parnell Commission (*see* 20.858). From that date he devoted all his masterful energies to the journal he served. When *The Times* Publishing Co. was formed in 1908, and the financial control passed from the Walter family to Lord Northcliffe, he became managing director. He died suddenly whilst at work in *The Times* offices April 5 1911.

BELL, GERTRUDE MARGARET LOWTHIAN (1868–), English traveller and geographer, was born at Washington, Durham, July 14 1868, the eldest daughter of Sir T. Hugh Bell, Bart. She was educated at Queen's College, London, and Lady Margaret Hall, Oxford, where she graduated first class in the final school of modern history in 1888. She travelled extensively in the Near East, making a specially adventurous journey across northern Arabia in 1913-4 over a practically unknown route, whereby she obtained a knowledge of the country which

proved of great value to the British Government when information concerning routes was required for the advance of the British army into Palestine during the World War. In 1914–5 she was in control of a special department of the British Red Cross, occupied in trying to trace soldiers reported as "missing." From 1916–7 she was attached to the Admiralty Intelligence Office in Cairo. In 1917 she went with the military authorities to Basra and followed the army up to Bagdad, where she subsequently acted as assistant political officer, the first woman to occupy so important an administrative post. In 1918 she received the founder's medal of the Royal Geographical Society.

Amongst her publications are: *Poems from the Divan of Hafiz* (translations, 1897); *The Desert and the Sown* (1907); *The Thousand and One Churches* (with Sir W. M. Ramsay, 1909); *Palace and Mosque at Ukhaider* (1914). She is also the author of the *Review of the Civil Administration of Mesopotamia*, issued as a White Book by the India Office, Dec. 1920.

BELLEW, HAROLD KYRLE (1855–1911), English actor, was born in Lancs. in 1855. He first appeared on the stage in Australia in 1874, afterwards coming to London and acting for two years with Irving at the Lyceum from 1878 to 1880. He had the reputation of being the handsomest man on the contemporary stage. In 1888 he joined Mrs. Brown-Potter in a tour round the world, and for the last ten years of his life played romantic and modern comedy parts in the United States. He died at Salt Lake City, Utah, Nov. 1 1911.

BELLOC, HILAIRE (1870–), British man of letters, was born near Versailles July 27 1870. His father was a Frenchman; his mother, an Englishwoman whose maiden name was Bessie Rayner Parkes, took an active share at an early date in the woman-suffrage movement (*see* 28.787). Educated at Edgbaston, he served as a driver in the 8th Regiment of French artillery before proceeding to Balliol College, Oxford. At Oxford he was prominent both in his schools and at the Union, and soon became known as a clever writer and speaker. He sat in the House of Commons for Salford from 1906 to 1910 as a Liberal. His very numerous writings include verse, children's books, essays, biography and fiction, as well as military history. Amongst them may be mentioned *Danton* (1899); *Robespierre* (1901); *The Path to Rome* (1902); *Esto Perpetua* (1906); *Cautionary Tales* (1907); *Mr. Clutterbuck's Election* (1908); *A Change in the Cabinet* (1909); *Marie Antoinette* (1910) and *A General Sketch of the European War* (1915 6).

His sister, Marie Adelaide Belloc-Lowndes (b. 1868), who in 1896 married Frederick Sawrey Lowndes, a member of the staff of *The Times*, also became well-known as the author of numerous novels and striking short stories, including *The Pulse of Life* (1907); *The Uttermost Farthing* (1908); *Studies in Wives* (1909); *The Chink in the Armour* (1912); *The Lodger* (1913), etc. Dramatized versions of the last two, by H. A. Vachell, were played in London as *The House of Peril* (1910) and *Who is He?* (1915). She published besides a biography of Charlotte Elizabeth, Princess Palatine (1880) and *Told in Gallant Deeds*, a history of the World War for children (1914).

BELOW, FRITZ VON (1853–1918), German general, was born Nov. 23 1853 at Danzig. He took part in the war of 1870–1 as a young officer. In 1912 he was appointed to the command of the XXI. Army Corps. In this capacity he fought with the VI. Army on the western front at the beginning of the World War, but his corps was transferred in 1915 to the eastern front. In 1916 he was chief in command of the I. Army, which fought with success in Nov. 1916 on the Somme. He died in a field hospital on the western front in Nov. 1918.

BELOW, OTTO VON (1857–), German general, was born at Danzig June 18 1857. At the beginning of the World War he was in command of the 2nd Infantry Div. at Insterburg in East Prussia. He was first of all promoted to the command of the I. Reserve Corps, and in this capacity took part in the battles against the Russian army of the Narev which resulted in the almost complete destruction of that army. He was then appointed to the chief command of the VIII. Army which bore an essential part in the victory over the Russian X. Army at the battles of the Masurian Lakes (Feb. 7–15 1915). In May 1915 he was placed in chief command of the German Niemen army and pressed forward with it in Courland (Kurland) and Lithuania as far as the southern reaches of the Dvina. In the autumn of 1916 he received the command of the German army group in Macedonia and in the autumn of 1917 was placed in chief command of the XIV. Army, which was fighting against Italy. In 1918 he led the XVII. Army, which particularly distinguished itself in the battles around Arras. After the war he was for a short period general in command of the XVII. Army Corps at Danzig. He resigned in June 1910.

BENCKENDORFF, ALEXANDER, Count (1849–1917), Russian diplomat, was born in 1849. His family came from Livonia, one of his ancestors having been burgomaster of Riga. His great-uncle, who achieved great distinction in the Russian imperial service in the reign of Nicholas I., becoming minister of the police and being raised to the rank of a count, died childless, the title and estates passing to his nephew, Count Alexander's father. The mother of Count Alexander was a princess of Croy. He was educated in a private school in Paris and passed his *baccalauréat* in due course. He entered the diplomatic service in 1869 and began as an attaché in Florence, eventually in Rome. He resigned in 1876 and lived nearly 10 years on his estates, in St. Petersburg and abroad. He married in 1879 Countess Sophie Schuvaloff. In 1886 he returned to diplomacy and served as first secretary in Vienna under Prince Lobanoff-Rostovsky and Count Kapnist. In 1897 he was appointed minister in Copenhagen and remained there until 1903. The Copenhagen post gave him, as well as some other diplomats, an exceptional opportunity of watching the principal moving powers of European politics from a point of vantage, as the matrimonial alliances of the Danish royal family occasionally brought together in a friendly family circle the widow of Alexander III., Nicholas II. and the Prince of Wales who was to become King Edward VII. In this way Count Benckendorff received his initiation into the spirit of an Anglo-Russian *rapprochement* even before it actually resulted in an Entente. When he was promoted in 1903 ambassador to the Court of St. James as a successor to Baron de Staal, the atmosphere seemed anything but favourable to such a *rapprochement*. The rivalry of the two Powers in the East, cunningly exploited by the Kaiser, was growing more and more acute. When the storm had discharged itself in the Japanese war, reasonable statesmen on both sides, King Edward, Lord Lansdowne, and the Russian Foreign Minister Isvolsky, changed the course both for Great Britain and for Russia, and thus frustrated the plans of the *tertius gaudens*. Count Benckendorff had an important share in bringing about this change. At a very critical moment, when the Kaiser had actually mesmerized Nicholas II. into the conclusion of a secret and personal convention at Björkö, which purported to aim at a defensive agreement, but would have led by necessity to the disruption of the Franco-Russian Alliance and to the vassalage of Russia in a continental league against England, Count Benckendorff was invited to Copenhagen and had an opportunity of serving as a confidential intermediary between Russia and Great Britain. The Kaiser was exceedingly angry and gave vent to his feelings in a letter to "Nicky": – "Like brigands in a wood he has sent Benckendorff—your Ambassador—to Copenhagen on a clandestine mission to your mother, with the instructions to win her over to influence you for a policy against me. The Foreign Office in London knows about his journey, which is denied at your embassy there." Tsar Nicholas's reply to this letter shows in what esteem Count Benckendorff was held by his sovereign:—"Benckendorff went by my permission as my mother invited him to come as a friend of the Danish family. What sort of conversation went on I certainly do not know. But I can resolutely assure you that nothing can influence me excent the interest, safeguard, and honour of my country. Benckendorff is a loyal subject and a real gentleman. I know he would never lend himself to any false tricks, even if they came from the 'great mischief-maker himself.'" The Björkö intrigue evaporated without leaving any

tangible result, and the historic *rapprochement* between Great Britain, France and Russia took its course. Benckendorff in London was excellently placed to keep up and to develop this policy. Liberal, courteous, a shrewd observer, loyal and watchful in the cause of Russia, he maintained the best possible relations with Lord Lansdowne and Sir Edward Grey, and became a favourite at Court and in London society. He was peculiarly adapted for the wise and skilful treatment of difficult problems in the spirit of an international set, playing the great game of diplomacy with grace and honour. He had to face the dominant fact of the situation—the aggressive pressure of Germany at a time when Russia was drifting into an internal crisis of the first magnitude and was unable to concentrate the material and moral forces required in the coming conflict. Unpleasant retreats had to be effected twice, before the Kaiser "in shining armour": the first time after Aehrenthal's annexation of Bosnia-Herzegovina, the second after the blocking of the Serbian advance towards the Adriatic. Benckendorff was one of those who knew how to abide his time, and he did not lose heart. There were greater trials in store when the World War broke out at last. His younger son fell in one of the first battles on the East Prussian front, and he lived to see the collapse of the corrupt military organization of Russia in the campaign of 1915. Fortunately for him, he did not live to see the *débâcle* of Russian society in 1917. He died Jan. 11 1917. (P. Vi.)

BENEDICT XV. (Giacomo della Chiesa), Pope (1854–1922), was born at Genoa on Nov. 21 1854. In contrast to his immediate predecessor Pius X., who was of humble origin, and whose ministerial experience was mainly pastoral, Benedict XV. was descended from one of the most ancient of the noble families of Italy, and his work and training had been chiefly in the official or diplomatic service of the Holy See. His ancestors in the Middle Ages were enrolled in the patricians of Genoa, while other branches of his family followed the popes to Avignon in the 14th century, and eventually their sons took service in the army of the king of France, under the name of d'Église. His brother served as rear-admiral in the Italian navy.

Giacomo della Chiesa was educated in the seminary and at the university of Genoa, where he took his degree as Doctor of Law in 1875. Afterwards he went to Rome and studied for the priesthood in the Collegio Capranica from which he passed to the Accademia dei nobili Ecclesiastici, the usual training school for those who devote themselves to the "carriera" or diplomatic service of the Vatican. Here he became the friend and favourite of Cardinal Rampolla who, on being sent in 1883 as papal nuncio to Madrid, took Mgr. della Chiesa with him as his private secretary. He remained in Spain four years, and in 1887, when Leo XIII. recalled Cardinal Rampolla to make him his secretary of state, Mgr. della Chiesa returned to Rome in the suite of his patron, and was given the post of *minutante* in his department. In this, his work was the summarizing and inditing of the official letters and dispatches of the Holy See, combined with the functions of confidential secretary. As he discharged these duties for 13 years, he had a full opportunity of acquiring a unique knowledge of the international relations of the Church throughout the world. In 1903, when Cardinal Merry del Val succeeded Cardinal Rampolla as secretary of state, Mgr. della Chiesa was retained in his post. On Dec. 16 1907, Pius X. appointed him Archbishop of Bologna, and on May 25 1914 raised him to the dignity of cardinal. The outbreak of the World War in Aug. of that year, and the death of Pius X. a few weeks later, found him in the midst of the pastoral duties of his great diocese. At this time, as Cardinal-Archbishop of Bologna, he delivered a remarkable address on the attitude and duty of the Church during the war, and strongly emphasized the paramount importance of the Holy See observing strict neutrality, not of indifference, but of impartiality, while leaving nothing undone to restore peace and good-will and to mitigate suffering. The address caused a deep impression, and it was no doubt much in the minds of the cardinals when they assembled in conclave for the election of a new pope on the last day of Aug. 1914. On Sept. 3, after 10 scrutinies or votings, Cardinal della Chiesa was elected by a large majority, and was proclaimed from the balcony of St. Peter's as Benedict XV. He died Jan. 22 1922.

BENNETT, CHARLES EDWIN (1858–1921), American classical scholar (*see* 3.740), died May 2 1921 at Ithaca, N.Y. His later publications include *Syntax of Early Latin* (two vols., 1910, 1914); *New Latin Composition* (1912) and *Horace's Odes and Epodes* (1914, in the Loeb Classical Library).

BENNETT, [ENOCH] ARNOLD (1867–), English novelist and playwright, was born in the Potteries district, Staffs., May 27 1867. Educated at Newcastle-under-Lyme, he was intended for the law, but abandoned it in 1893 for journalism. He was assistant-editor and then editor of the periodical *Woman*, but in 1900 gave up journalism and became a prolific writer of books, especially novels illustrating the life of his native district, early examples of which were *Anna of the Five Towns* (1902) and *The Grim Smile of the Five Towns* (1907). In 1908 he established his reputation as a novelist with *The Old Wives' Tale*, followed by the series *Clayhanger* (1910); *Hilda Lessways* (1911) and, much later, *The Roll Call* (1919). But he also adventured into other *genres* of fiction, sensational, humorous and ironical, of which *The Grand Babylon Hotel* (1902); *Sacred and Profane Love* (1905, dramatized 1919); *Buried Alive* (1908); *The Card* (1911); *The Regent* (1913); *The Lion's Share* (1916) and *The Pretty Lady* (1918) are examples. His plays, especially *The Great Adventure* (dramatized in 1913 from the novel *Buried Alive*); *What the Public Wants* (1909); *The Honeymoon* (1911); *Milestones* (with Edward Knoblock, 1912) and *The Title* (1918) showed him a master of modern comedy; and he also produced in *Judith* (1919), a modernized version of the biblical story. In 1920 he published *Our Women*, a series of essays on modern feminine types and feminist problems.

BENNETT, JAMES GORDON (1841–1918), American newspaper proprietor (*see* 3.741), died May 14 1918, in Paris, whence he had long directed the policies of the *New York Herald*. In his will he provided for the establishment of "The James Gordon Bennett Memorial Home for New York Journalists" in memory of his father, the founder of the *New York Herald*.

BENSON, ARTHUR CHRISTOPHER (1862–), English man of letters (*see* 3.745), was in 1915 elected master of Magdalene College, Cambridge. Among his recent books are *Ruskin: a Study in Personality* (1911) and biographies of his brother *Hugh: Memoirs of a Brother* (1915) and of his sister *Life and Letters of Maggie Benson* (1917), besides various volumes of essays and prose sketches.

His younger brother, Edward Frederick Benson (1867–), published after 1910 a large number of novels, amongst which may be mentioned *Thorley Weir* (1913); *Dodo the Second* (1914); *David Blaize* (1916); *Mr. Teddy* (1917); *The Countess of Lowndes Square* (1920). He also wrote a one-act comedy, *Dinner for Eight*, which was successfully produced at the Ambassadors' theatre, London, in March 1915.

The youngest brother, Robert Hugh Benson (1871–1914), died at Salford Oct. 19 1914. In 1911 he was appointed private chamberlain to Pope Pius X. His later books include *The Dawn of All* (1911), a curious forecast of England under Catholic government; *Come Rack! Come Rope!* (1912); *An Average Man* (1913) and *Initiation* (1914).

BENSON, SIR FRANCIS ROBERT (1858–), English actor, (*see* 3.745), was knighted in 1916. During the World War he served for over two years as an orderly in a canteen managed by Lady Benson, first near Belfort and later at St. Just and near Senlis. In 1918 he was attached as an ambulance driver to various French regiments engaged in the Somme and Aisne campaign, and he received the Croix de Guerre on the battlefield near Oudenarde.

BENSON, WILLIAM SHEPHERD (1855–), American naval officer, was born at Macon, Ga., Sept. 25 1855. He graduated from the U.S. Naval Academy in 1877, and after various promotions became captain in 1909 and rear-admiral in 1915. He had been commandant of the Philadelphia Navy Yard two years when, in 1915, he was appointed chief of naval

operations. He was a member of the commission appointed to confer with the Allied Powers in 1917, naval representative in drawing up terms of the Armistice, and naval adviser to the American Peace Commission. He was retired automatically in 1919 and made admiral for life.

BENTLEY, JOHN FRANCIS (1839–1902), English architect, was born at Doncaster in 1839, and commenced his career as an engineer, later passing three years in a builder's office, a course of practical training the benefits of which are evident throughout his work. He subsequently entered the office of Henry Clutton whose practice was very largely in an ecclesiastical direction, and where young Bentley's bias towards that French Gothic treatment of design, by which his earlier work was distinguished, found support and encouragement. Established on his own account in 1862, commissions flowed in for work not only of an architectural nature but also giving scope for his talent in designing for the subsidiary arts, such as stained glass, goldsmith's work, embroidery and the like. His earliest important undertaking was the enlargement and decorative treatment of St. Francis' church, Notting Hill, followed by other ecclesiastical work in London and the country, in which he shows an increasing tendency towards a more English form of expression in his design. The beautiful seminary of St. Thomas at Hammersmith, noteworthy not only for its architectural treatment but, as usual with Bentley, for a carefully conceived and thought-out plan, was followed by St. John's school at Beaumont, one of the best examples of his power to deal with design based on English Renaissance of the 17th century. For many years he was occupied in the completion of Carlton Towers, the seat of Lord Beaumont, left unfinished on the death of E. W. Pugin. On the decorative work of this fine building he spent during the 15 years he was engaged on it an immense amount of thought and invention, and with marked success. A very excellent example of Bentley's skill in adapting mediaeval ideals to the circumstances of our times, while yet infusing them with an individuality that lifts them above the level of sheer copyism, is to be found in Holy Rood church, built by him 1892, in which, as regards the interior, he gave free rein to his sense of colour as a final complement of his design.

It was after 30 years of strenuous work at his art, and in his 56th year that Bentley—his claims strongly supported by the most eminent of his fellow architects—was appointed by Cardinal Vaughan as architect of the proposed Roman Catholic cathedral in Westminster, his unremitting and enthusiastic labour upon which occupied the remainder of his life. Already, before his selection by the authorities, it had been decided that for the new building it would be far from desirable to adopt Gothic principles and traditions. The principal factor in coming to this conclusion was the obvious danger of an unpleasant competition, both as regards size and aesthetic treatment, with the closely neighbouring Westminster Abbey. To equip himself thoroughly for dealing with the problem in terms of the Byzantine style settled upon, Bentley determined, as a preliminary, to study his subject at first hand in Italy and Constantinople, and in 1894 he spent several months in northern Italy and Rome with this end in view. From a series of sketch plans prepared on his return was gradually evolved that adopted for the cathedral as now built, a masterly treatment of a difficult problem. The exterior dimensions of the building are 360 ft. in length by 156 ft. in width, the interior of the nave being 232 ft. long, and 60 ft. wide. The three bays into which its length is divided are covered with saucer-shaped domes 112 ft. in height, and springing from enormous piers. The aisles, narrow, as being used for processional purposes only, give on to the seven side-chapels. The truly imposing character of the building was perhaps more to be appreciated when its walls, piers and arches were in their undecorated state, and full value was given to its 342 ft. of length, and to a vast nave higher and wider than any in England. It was always intended that the whole of the inside wall and arch surface should be clothed with marble and mosaic, and to no one could so sumptuous a manner of vesting his building in rich apparel appeal more than to Bentley, and in no hands could it have been placed with more hope of success. There was, however, much difficulty in arriving at a scheme for the comprehensive treatment of the whole of the vast building, which should be devotional and symbolic, and above all possess a unity of conception. Bentley himself prepared a very thoughtful and complete proposal, partly embodied in the mosaics so far executed, but, unfortunately, only partly so.

In May 1898 he visited the United States to consult as to the proposed cathedral at Brooklyn, and for this he prepared a design, in which he, this time, reverted to Gothic, and which he left incomplete at his death. He died after seeing all but carried into effect and full realization his dream of a church building which should in a grand manner show forth all of the beauty and holiness of that religion to which he had as a young man given himself, and which was throughout his life, in all the work of his genius, his inspiration. On the eve of being presented with the gold medal of the Royal Institute of British Architects he died at Clapham March 2 1902.

BERCHTOLD VON UND ZU UNGARSCHITZ, LEOPOLD, COUNT (1863–), Austro-Hungarian statesman. The Berchtolds are a Moravian noble family whose patent of knighthood and nobility of the empire dates from 1616. They became counts in 1673, and acquired their Hungarian rights in 1751. Count Leopold Berchtold, born April 18 1863, was employed first in the Moravian Government, entered the service of the Austro-Hungarian Foreign Office in 1893, and in 1894 was attached to the Paris embassy. In 1903 he went as councillor of legation to St. Petersburg, and in Dec. 1906 was appointed ambassador there. With the Russian court and the aristocratic society of St. Petersburg he maintained the best relations, but failed entirely in his zealous efforts to accommodate the obviously increasing differences between Russian and Austro-Hungarian policy. He took a leading part in the negotiations preceding the crisis caused by the annexation of Bosnia-Herzegovina, which aimed at securing common action of the two powers in the Balkan question. It was at his château of Buchlau, in Moravia, that the fateful conference took place between Isvolski and Aehrenthal (Sept. 15 1908). At the time of the strained relations between the Cabinets of St. Petersburg and Vienna, which followed the annexation, and under the shadow of the personal feud between the two foreign ministers, the position of Berchtold at St. Petersburg was extremely difficult. For months together he had to avoid all official intercourse with the Russian Foreign Office; and it was not till the spring of 1909, when the violence of the quarrel had abated, that he could resume his efforts to improve the relations between the two states. His success was only temporary; the tension, indeed, for a time relaxed; but gradually it increased, and during the last months of his residence in St. Petersburg became extreme. In March 1911 Count Berchtold was recalled from Russia, and on Feb. 17 1912 he was, against his own will, appointed Aehrenthal's successor as Foreign Minister.

His efforts were primarily directed towards securing the position of Austria-Hungary in the Balkan Peninsula. He wished to bind Bulgaria more closely to the Triple Alliance; to strengthen the ties of the Habsburg Monarchy with Rumania and Turkey, to foil the aspirations of Serbia for an extension of territory. To the idea of solving the questions at issue with this latter power with the sword he was at this time opposed, contemplating a peaceful solution of the Balkan question by agreement with Russia and the Western Powers. In this sense he spoke at the first session of the Delegations in which he took part as Foreign Minister. But the increasingly obvious efforts of Russian statesmen to weaken the influence of Austria-Hungary in the Balkans, the aggressive activities of the Serbs, and the ambiguous behaviour of Bulgaria forced him to change his attitude, especially as he failed to receive from the Western

Powers the support which he had sought from them. In Oct. 1912, at a meeting at San Rossore, he came to certain agreements with the Italian Foreign Minister, San Giuliano, of which the objects were to secure the autonomy of Albania and to counter Serbia's plan for an extension of her power in the Adriatic coast-lands. The renewal of the Triple Alliance followed at the beginning of December.

Meanwhile the struggle between Turkey and the Christian nations of the Balkans had broken out. During the three Balkan wars, fought between Oct. 1912 and Aug. 1913, Berchtold's attitude was a weak one. He repeatedly took steps towards active intervention, but drew back when the Entente Powers used threats and the other members of the Triple Alliance intervened with counsels of moderation in Vienna. His efforts at the close of the third Balkan War to secure a revision of the Treaty of Bucharest (Aug. 10 1913), which was unfavourable to Bulgaria, were as unsuccessful as his attempt to secure an accommodation between Bulgaria and her rivals by way of direct negotiation. The prestige of Austria-Hungary in the Balkans noticeably declined. Serbia's endeavours to extend her power to the Adriatic, and to win recruits for the ideal of Great Serbia among the kindred Slav races of Austria-Hungary, became more and more evident and pressed for a decision. For these reasons, at the conferences at the Ballplatz which followed the murder of the heir to the throne, the Archduke Francis Ferdinand, on June 28 1914, Berchtold maintained the view that a definitive settlement with Serbia was essential, even at the risk of war with Russia and France. He does not seem at that time to have reckoned with the possibility of an active participation of Great Britain on the side of the opponents of the Triple Alliance.

After the outbreak of the World War he directed his efforts to inducing Italy and Rumania to carry out their obligations and to securing new allies for the Central Powers. These efforts were for the most part unsuccessful. Turkey alone joined the Central Powers. Rumania and Italy declared their neutrality; even Bulgaria dragged out the negotiations, though Berchtold offered great concessions in return for her active intervention on the side of Austria-Hungary and Germany. Italy's demands for compensation were indeed acknowledged in principle by Berchtold, under pressure from Germany, but he embarked on the negotiations with hesitation, and down to the day of his resignation he refused to listen to any proposal for the cession of territory which had long been under Austrian rule. In the course of the war Berchtold came into conflict with German statesmen and the German Supreme Army Command. He thought that Germany did not give sufficient support to her ally in the severe struggle against the superior strength of Russia, and protested strongly against the readiness with which Germany had agreed to the territorial and other demands of Rumania and Italy. The reasons of his fall, which took place on Jan. 13 1915, are still obscure, but it is certain that the attitude of Stephen Tisza and his adherents, from the autumn of 1914, in refusing to coöperate with him was a contributory cause. In March 1916 Berchtold was appointed *Obersthofmeister* (Lord High Steward) to the heir to the throne, Charles Francis Joseph, whom he subsequently served as *Oberkämmerer* (Lord High Chamberlain). After the fall of the dynasty he took no part in politics. (A. F. Pr.)

BÉRENGER, RENÉ (1830–1915), French lawyer and politician (*see* 3.769), died Aug. 29 1915.

BERESFORD, CHARLES WILLIAM DE LA POER BERESFORD, 1st Baron (1846–1919), British admiral (*see* 3.770), who was raised to the peerage in 1916, died in London Sept. 6 1919.

BERGSON, HENRI LOUIS (1859–), French philosopher, was born in Paris Oct. 18 1859. Educated at the Lycée Corot, and the École Normale he was successively professor of philosophy at the Lycée d'Angers 1881–3, at the Lycée de Clermont 1883–8, at the Collège Rollin 1888–9, at the Lycée Henry IV. 1889–97, at the École Normale Supérieure 1897–1900 and at the Collège de France 1900–21. In 1912 he was Gifford lecturer at Edinburgh. Of the three works which constitute together the full exposition of his interpretation of experience, *Les Données Immédiates de la Conscience* was published in 1889, *Matière et Mémoire* in 1896, and *L'Évolution Créatrice* in 1907. The English translations (*Time and Free Will, Matter and Memory* and *Creative Evolution*) all belong to 1910–1. He had published also *Le Rire* (1900). With the exception of a pamphlet, *La Signifiance de la Guerre* (1915), nothing more appeared until *L'Energie Spirituelle* (1919), with Eng. trans. *Mind-Energy* (1920).

For a discussion of his work, see PHILOSOPHY.

BERLIN (*see* 3.785).—Since 1910 the city of Berlin (pop., Greater Berlin 1919 census, 1,902,509; 1910 census 2,071,257) has undergone a very considerable development in respect of the form of its municipal organization. The rapid growth of the suburbs, which were independent communities, necessitated the adoption of certain main lines of procedure, applicable both to them and to Berlin, in order to prevent conflicting action on the part of the authorities on one side and the other. This led, in 1911, to the creation of Greater Berlin as, in the first instance, an association of the city with the more important outlying districts for special objects. It embraced the city of Berlin and the towns of Charlottenburg, Schöneberg, Neukölln, Wilmersdorf, Lichtenberg and the administrative circles of Teltow and Niederbarnim. Its objects were to institute a common control of streets, roadways and the elevated railway, also of building and street alignment plans, the uniform coördination of police regulations and the acquisition of large tracts of forest and of land for building. This special union came into force on April 1 1912. It soon became manifest, however, that beyond coöperation for special purposes, a further coördination of the administrations of these places was requisite. It was only in the year 1920 that it was possible, after long negotiations, to form a new municipality of Berlin, embracing all the suburbs under a single united administration. A law to this effect was carried through the Prussian Constituent Assembly on April 27 1920 and was put into force on Oct. 1 of the same year. This law effected the centralization of Berlin and all its suburbs into one uniform municipal region (*Stadtbezirk*), but nevertheless left large powers of local self-administration to the individual communes (*Gemeinden*).

On May 15 1912 the former Secretary of State for the Treasury of the Empire, Wermuth, was elected chief burgomaster of Berlin in place of Kirschner, who had resigned. Under his administration, which lasted till Nov. 25 1920, the city experienced notable developments. The first municipal crematorium was opened in 1912. In June 1914 the ship canal uniting Berlin with Stettin was inaugurated. In the same year the city acquired the estate of Lanke, thus securing extremely valuable land for settlement purposes. In Oct. 1915 the city purchased the Berlin Electrical Works for 128 million marks (pre-war value about £6,400,000). The years of the war necessitated the vigorous intervention of the municipal administration in order to keep the population supplied with food and other necessaries of life. A special commission for food supplies was appointed as early as 1914. In 1915 the supply of meat, vegetables, milk, etc., by the municipality was instituted. The management of all these supplies necessitated the appointment of a host of officials. The establishment of the War Departments of the empire and of Prussia as well as of the city thus entailed an accession of population which by 1917 had caused a great dearth of house accommodation, a scarcity which constantly increased up to 1921, so that special offices for enabling the public to obtain dwellings had to be established under municipal supervision. Even in 1921 it was almost impossible to find a flat. The general necessities arising out of the war demanded vast expenditure on the part of the city, so that its financial position had by 1921 become extremely unfavourable, while municipal taxation had been about trebled.

The city of Berlin suffered severely from the effects of the revolution of Nov. 9 1918. The revolution itself was practically bloodless, so far as Berlin was concerned, although the stormy sittings of the Workmen's and Soldiers' Councils, held in the Reichstag building, occasionally led to minor collisions. It was not till Christmas 1918 that serious fighting took place, when the Independent Socialist party, supported by the Sailors' Division, tried to seize power. After several days of sanguinary combats in the neighbourhood of the castle and the royal stables, where the sailors had established themselves, the division was ultimately compelled to surrender. Early in March 1919 the Spartacist insurrection broke out; it began in the suburb of Lichtenberg and spread over the whole

centre of the city. The number of those who were killed in the street fighting was 1,175. The last victims of the revolution met their death on Jan. 13 1920 when a mass of people incited by Spartacist propaganda in connexion with the parliamentary debates on the Industrial Councils bill (*Betriebsrätegesetz*), attempted to storm the Reichstag building. There were 42 killed and 105 wounded. The Kapp *Putsch* in March of the same year was likewise attended by some casualties, but the decisive episode was a general strike imposed by the Socialist parties and the working-class leaders in order to put an end to Kapp's usurpation of power.

As a result of the assimilation of the municipal to the parliamentary franchise a large Left majority composed of Social Democrats, Independent Socialists and Communists was elected to the Municipal Council of Greater Berlin. The Berlin school system was presently recast in the sense of the extreme secularists, a change which the non-Socialist parties were in 1921 still vigorously combating. The workmen employed by the municipality and the tramwaymen constantly demanded higher wages, which even the extreme Left majority in the Council were unable to concede, so that strikes in the electricity and gas works and cessation of work on the tramway lines were of frequent occurrence. Gradually, however, the economic life of Berlin seemed by 1921 to be entering upon a period of greater regularity. Chief Burgomaster Wermuth was succeeded in Nov. 1920 by the former city treasurer, Boss. (C. K.*)

BERNHARDI, FRIEDRICH VON (1849–), German military leader and writer, was born Nov. 22 1849 at St. Petersburg. He took part in the war of 1870–1 as a young officer in the 14th Hussars. When the German troops entered Paris in March 1871 he was the first German to ride into the city. From 1891 to 1894 he was German military attaché at Berne and was subsequently head of the military history department of the Grand General Staff in Berlin. He was appointed general in command of the VII. Army Corps at Münster in Westphalia in 1907, but retired two years later and busied himself as a military writer. Wide-spread attention was excited by the memoirs of his father, the diplomatist and historian, Theodor von Bernhardi, which he published, and still more by his celebrated book *Germany and the Next War* which appeared in 1912. On the outbreak of war in 1914 he was again placed at the head of an army corps and fought with success first on the Stochod, where he stormed the bridgehead of Tsarecze and afterwards on the western front, in particular at Armentières.

BERNHARDT, SARAH [Rosine Bernard] (1845–), French actress (*see* 3.801), made a specially successful tour in America in 1906. In 1909 she played Jeanne d'Arc in Paris. In 1910 she again toured in America. In 1913 she was given the Cross of the Legion of Honour. Though lame as the result of an operation, she appeared in Nov. 1920 in Paris in a new play *Daniel*, by Louis Verneuil, and repeated this in London in April 1921.

BERNSTEIN, EDUARD (1850–), German Social-Democratic politician and writer, was born in Berlin Jan. 6 1850. From 1866 to 1878 he was employed in banks. Since 1872 he has been an active advocate and expounder of socialism. In 1878 he acted as private secretary to K. Hochberg, editor of the socialistic review *Zukunft*. From 1881 to 1890 he was on the editorial staff of the *Social-Democrat*, a leading organ of the German Social-Democratic party, which was published at Zürich because, owing to the anti-socialistic legislation, free expression for its views could not be found in Germany. He was expelled in 1888 and migrated to London, where he lived in intimate intercourse with Friedrich Engels and other followers of Karl Marx. He returned to Germany in 1901 and was elected deputy to the Reichstag for Breslau, a seat which he continued to hold till 1907. His numerous published works include: *Die Voraussetzungen des Sozialismus und die Aufgaben der Sozialdemokratie* (1899); *Die Kommunistischen und Demokratisch-Sozialistischen Strömungen in England während des 17ten Jahrhunderts* (1895); *Zur Geschichte und Theorie des Sozialismus* (1900); *Ferdinand Lassalle und seine Bedeutung für die Arbeiterklasse* (1904); *Sozialismus und Demokratie in der grossen Englischen Revolution* (1908) and an edition of Lassalle's speeches and writings with a biographical introduction (3 vols., 1892–3), etc. In these he dealt principally with the theoretical and historical aspects of socialism. In 1904–5 he edited the monthly publication *Dokumente des Sozialismus* and in 1904 the weekly *Das Neue Montagsblatt*. In the conflict between the orthodox Marxists and the revisionists Bernstein was one of the foremost champions of the latter. His differences with Kautsky, the literary protagonist of the straitest sect of the Marxians, were gradually healed after Bernstein, like Kautsky, associated himself with the Independent Socialists in 1915, and still more when both of them broke with the extreme Independents, the self-styled Communists, who advocated government by councils on the Moscow pattern and the "dictatorship of the proletariat." Immediately after the revolution Bernstein was appointed Secretary of State for the Treasury, an office which he held till Jan. 1919. He had again been a member of the Reichstag from 1912–8. Subsequently he left the Independents and returned to the fold of the governmental German Social-Democratic party.

BERNSTORFF, COUNT JOHANN HEINRICH VON (1862–), German diplomatist and politician, was born in London Nov. 14 1862, the son of the Prussian diplomatist Count Albrecht von Bernstorff. He entered the diplomatic service in 1899, was secretary of legation successively at Belgrade, Dresden, St. Petersburg and Munich, and (1902–6) councillor of embassy in London. He then went as consul-general to Cairo, whence he proceeded as German ambassador in 1909 to Washington and remained there until America's declaration of war against Germany in April 1917. He made great efforts to facilitate mediation by President Wilson, but he did not receive the support he expected from authoritative quarters in Berlin. He himself has repudiated any active connection with the criminal plots and intrigues which were conducted by German agents, including the German military attaché, Boy-Ed, in America before the rupture of relations; he also maintains that he entirely disapproved of the German foreign secretary, Zimmermann's, monstrous proposals to Mexico. If so his position must have been an exceedingly difficult and anomalous one. On the American declaration of war he returned to Germany and was sent as ambassador to Constantinople, where he was employed until 1918. In various publications he has endeavoured to prove that Germany, if she had followed the proper policy, could have avoided war with America. This statement of his views excited much controversy in his own country. When the revolution broke out Bernstorff left the diplomatic service, but has since taken an active part in parliamentary politics as a member of the Democratic party in the Reichstag, and has also maintained a close connexion with the international press and with pacific post-war propaganda. (C. K.*)

BERTHELOT, HENRI MATHIAS (1861–), French general, a son of the chemist, Marcellin P. E. Berthelot (*see* 3.811), was born at Feurs (Loire), Dec. 7 1861. At 20 years of age he entered St. Cyr, and in 1883 was appointed a sub-lieutenant in the 1st Regt. of Zouaves. Three years later he was promoted lieutenant. In Nov. 1891 he was made a captain and was transferred to the 99th Inf. Regiment. In 1907 he became a lieutenant-colonel and was posted to the 55th Inf. Regiment. He was then given a staff appointment, being promoted colonel in June 1911. In Dec. 1913 he was made a general of brigade. On the outbreak of the World War he was appointed head of the French operations staff at headquarters, and in this capacity he exercised a very marked influence on the course of events in Aug. 1914, so much so as to expose him later to the reproach of having been "the irresponsible commander-in-chief" during the disastrous battle of the Frontiers. In Nov. of the same year he was given command of a division. In Aug. 1915 he became commander of the XXXII. Army Corps, an appointment which he retained until Sept. 1916, when he was made chief of the French military mission to Rumania. Here his thoroughness was the principal factor in revising the Rumanian army, and the fruits of his work appeared in the campaign of 1917. In June 1917 he was made a grand officer of the Legion of Honour. After a brief mission to the United States he was, in July 1918, given command of the V. Army. This army he commanded in the battles on the Marne

and the Aisne, which initiated the final Allied offensives. Later, he was sent on a mission to the Balkans. In Oct. 1919 he was made governor of Metz.

BERTHELOT, PHILIPPE JOSEPH LOUIS (1866–), French diplomat, was born Oct. 9 1866, a son of Marcellin Berthelot, the famous chemist and politician (*see* 3.811). After having passed through the regular stages of a diplomatic career, he was sent on a mission to the Far East in 1902, and returned to the Foreign Office to mount the hierarchical steps of promotion, many of which, by reason of his appointment as *chef de cabinet*, he was able to take at a single bound. He acted as Briand's righthand man throughout his term of office as Minister of Foreign Affairs and prime minister; became Clemenceau's trusted adviser during the World War and the Peace Conference, and succeeded Jules Cambon, with the rank of an ambassador, as general secretary of the Ministry of Foreign Affairs.

BERTIE, FRANCIS LEVESON BERTIE, 1ST VISCOUNT (1844–1919), English diplomatist, was born at Wytham Abbey, Oxon., Aug. 17 1844, the second son of the 6th Earl of Abingdon. He was educated at Eton, and in 1863 entered the Foreign Office. In 1874 he married the daughter of the 1st Earl Cowley. He was attached to the special embassy to Berlin in 1878, and in 1881 was secretary to the Duke of Fife's mission to invest the King of Saxony with the Garter. In 1894 he became assistant Under-Secretary for Foreign Affairs, a post which he retained till 1903. He was then appointed British ambassador to Italy, but remained in Rome for only a year, being appointed in 1905 ambassador to France. The Anglo-French agreement had been signed in 1904, and the new ambassador's personal popularity was most successful in strengthening the ties thus formed between England and France. On the outbreak of war in 1914 Sir Francis Bertie's position became one of great importance and responsibility, and he was untiring in his efforts towards establishing the most complete understanding between England and France. He retired in 1918. Bertie had been made K.C.B. in 1902, G.C.V.O. and privy councillor in 1903, G.C.M.G. in 1904, and G.C.B. in 1908. He was raised to the peerage on his retirement with the title of Viscount Bertie of Thame. He died in London Sept. 27 1919 and was succeeded by his son, Vere Frederick Bertie (b. 1878).

BERTILLON, ALPHONSE (1853–1914), French anthropometrist (*see* 3.812), died in Paris Feb. 13 1914.

BERTOLINI, PIETRO (1853–1920), Italian statesman, was born at Montebelluna in 1853. He began his career as a barrister and student of economic and administrative questions, and entered parliament in 1891 as member for his native town. Two years later he became Under-Secretary for Finance in the Crispi Cabinet. He was afterwards Under-Secretary at the Ministry of the Interior in the Pelloux Cabinet (1898–1900), in which he was, so to speak, the representative of Baron Sonnino's party. On the fall of Gen. Pelloux he hoped to return to office in a future Sonnino ministry; but as the latter seemed ever less likely to become a reality, Bertolini lost patience and joined Sig. Giolitti. His conduct in abandoning his old chief was much criticised at the time, but his new patron chose him as Minister of Public Works in the Cabinet of 1907. He proved a capable administrator, but his qualities were taxed to the utmost by the terrible earthquake at Messina and Reggio in 1908. When Giolitti returned to power in 1911 he did not at first offer an appointment to Bertolini, but in the autumn of 1912 he entrusted him with the newly constituted Ministry of the Colonies. He failed, however, to show any exceptional qualifications for that position, and did little more than introduce some of the less desirable features of the Italian bureaucratic system into the new African possessions; the continued resistance of the Arabs in Libya was generally regarded as largely due to Bertolini's administrative errors. He was *rapporteur* for the extended suffrage bill, which first came into force with the general elections of 1913; the measure had been introduced to please the demagogic spirit which Giolitti wished to conciliate, but Bertolini must be given credit for the ingeniousness of the machinery which he devised for enabling illiterates to vote and for avoiding electoral corruption as far as possible. On the outbreak of the World War Bertolini, as a faithful Giolittian, was an uncompromising neutralist, and came in for much obloquy in consequence. Throughout the war he remained in retirement, and failed to be reëlected in 1919. Sig. Nitti appointed him senator and president of the Italian delegation on the Reparations Commission. He was the author of several valuable works on political and economic questions, notably a volume on local government in England. He died at Turin, Nov. 28 1920.

BESANT, ANNIE (1847–), English theosophist, was born in London Oct. 1 1847, the daughter of William Page Wood. She married in 1867 the Rev. Frank Besant (d. 1917), afterwards vicar of Sibsey, Lincs., but obtained a separation from her husband in 1873. She had become an ardent freethinker, and shortly afterwards she was prosecuted and convicted, together with Charles Bradlaugh (*see* 4.372), for publishing "blasphemous" literature. From 1874 to 1888 she worked in close association with Bradlaugh both in politics and in free-thought propaganda, as a lecturer and a writer of pamphlets over the signature of "Ajax." Her increasing tendency towards socialism of the more revolutionary type occasioned a divergence between them after 1885, which was completed in 1889 by her adhesion to the Theosophical Society. She became a devoted pupil of Mme. Blavatsky (*see* 4.48), founded schools at Benares, and was elected president of the Theosophical Society in 1907. In later years her activities again assumed a political cast. She founded the Indian Home Rule League and became its president in 1916, and in 1917 she was president of the Indian National Congress. In addition to her numerous free-thought pamphlets and a large number of later works on theosophy, she published her *Autobiography* in 1893, *The Religious Problem in India* (1902) and other books.

BESELER, HANS VON (1850–1921), Prussian general and governor of Poland during the German occupation, was born April 27 1850 at Greifswald. He was one of those generals who, after having been placed upon the retired list, were recalled in 1914 to assume important commands. He conducted the siege of Antwerp, which he occupied on Oct. 9 1914. In 1915 he was employed on the eastern front, and on Aug. 19 of that year took Novogeorgievsk. From Aug. 27 1915 to Nov. 1918 he was German governor-general of Poland at Warsaw, in which capacity he endeavoured with diminishing success to organize a form of Polish national government and representation under German auspices, as also to form a Polish army under German control. The Armistice and the German Revolution put an end to the complicated attempts of Beseler and the Austrians to arrive at a *modus vivendi* with regard to Poland's political and territorial destiny. The revolutionary Soldiers' Councils asserted themselves, and the governor-general with the German troops of occupation left the country. He died near Potsdam, Dec. 22 1921.

BESNARD, PAUL ALBERT (1849–), French painter, was born in Paris in 1849 and studied at the École des Beaux-Arts, winning the Prix de Rome in 1874. Until about 1880 he followed the academic tradition, but then broke away completely, and devoted himself to the study of colour and light as conceived by the impressionists. The naturalism of this group never appealed to his imagination, but he applied their technical method adapted to meet more complicated problems of light, such as a union of twilight and artificial light to ideological and decorative works on a large scale towards which his residence in Rome had strongly inclined him. Such are his decorations at the Sorbonne, the École de Pharmacie, the Salle des Sciences at the Hôtel de Ville, the mairie of the first arrondissement, the Théâtre Français, the Petit Palais, and the chapel of Berck hospital, for which he painted twelve "Stations of the Cross." A large panel, "Peace by Arbitration," was completed seven days before the outbreak of war in 1914. A great virtuoso, he has handled with equal facility water-colour, pastel, oil-painting and etching. Partly under the influence of Gainsborough and Reynolds, whom he studied during a three-years stay in England, he has applied his methods to a brilliant series of portraits, especially of women. Notable among these are the "Portrait

de Théâtre" (Mme. Réjane), and "Mme. Roger Jourdain." Recent work includes "Cardinal Mercier" (1917) and "The King and Queen of Belgium" (1910). His analysis and treatment of light is well seen in "La Femme qui se chauffe" in the Luxembourg, Paris, one of a large group of nude studies of which a recent example is "Une Nymphe au bord de la mer"; and in the work produced during and after a visit to India in 1911. His landscape work is represented by "L'île heureuse," and "Un Ruisseau dans la Montagne" (1920). A symbolist in his decorative work, Besnard's frank delight in the external world and his "chic" luminous technique bring him close to the 18th-century French painters. A foundation member of the Société Nationale des Beaux-Arts in 1890, in 1913 he became a member of the Institute and commander of the Legion of Honour. He has succeeded Carolus Duran as director of the French Academy in Rome.

BETHAM-EDWARDS, MATILDA (1836–1919), British author, was born at Westerfield, Ipswich, March 4 1836. She studied French and German abroad and after some school-teaching in London, she settled down with her sister in Suffolk to manage the farm which had belonged to her father. Not content, however, with purely rural occupations, she contributed from time to time to *Household Words*, having the advantage at this time of the friendship of Charles Dickens and an early association with Charles and Mary Lamb, friends of her mother. On her sister's death she moved to London and wrote a number of novels of French life based on her frequent visits to France and her intimate knowledge of provincial French homes. In this way she did much to promote a better understanding between the two peoples. Her chief books are: *The White House by the Sea* (1857); *Anglo-French Reminiscences* (1898); *East of Paris* (1902); *Home Life in France* (1905); *Literary Rambles in France* (1907) and the posthumously published *Mid-Victorian Memories* (1919), which contains a personal sketch of its author by Sarah Grand. She died at Hastings Jan. 4 1919.

BETHMANN HOLLWEG, THEOBALD VON (1856–1921), Chancellor of the German Empire from July 1909 to July 1917, was born Nov. 29 1856 at Hohenfinow, the family property near Berlin, where he also died. He was descended from the Frankfurt banking family of Bethmann, which attained great prosperity in the 18th century, and a branch of which was founded by his great-grandfather Johann Jakob Hollweg, who had married a daughter of the house. The Chancellor's grandfather was Moritz August von Bethmann Hollweg, a Bonn professor of law, who was a leading member of the Prussian Diet from 1849 to 1855 and was Minister of Education under the Prince-Regent (afterwards William I.) from 1858 to 1862. It was to the Liberal and West-German as well as the commercial traditions of his family that Theobald von Bethmann Hollweg probably owed his appointment to the chancellorship in 1909 in a time of domestic and financial crisis. He had at the same time the qualification of a specifically Prussian career, having risen through the regular legal and official stages of promotion as Referendar, Assessor, Landrat, Government-President at Bromberg and Chief President of the province of Brandenburg. In 1905 he was appointed Prussian Minister of the Interior and in 1907 Secretary of State for the Imperial Home Office and Vice-president of the Prussian Ministry. At the time of Bethmann Hollweg's appointment to the chancellorship internal affairs, under his predecessor Prince Bülow, had reached a deadlock in the Reichstag owing to the revolt of a section of the Liberal-Conservative *bloc* against the proposal to establish death duties as part of the reform of the finances of the empire. The Catholic Centre, which had left the former parliamentary coalition before the dissolution of the Reichstag by Prince Bülow in 1907, was once more in alliance with the Conservatives, and the fiscal policy which these two parties had imposed upon the Government and the country had alienated the commercial classes and led to violent political conflicts. It was not until the general elections of 1912 had transformed the situation by bringing a great accession to the strength of the moderate National Liberals and the Left, especially the Social Democrats, that the Government was able to reckon upon a more amenable majority. In the interval Bethmann Hollweg endeavoured to conciliate the Catholic Centre by a policy of compromise in matters which had threatened to lead to a renewal of the *Kulturkampf*, such as the denunciation of the Reformation in the Papal Encyclical of 1910 and the Catholic demand for the modification of the Jesuit law. He secured the final abrogation of this law under stress of war conditions in April 1917. Bethmann Hollweg was likewise the sponsor of the new constitution for Alsace-Lorraine, which in 1911 established the government of that territory of the empire upon the basis of popular representation in a territorial assembly and admission, though without full state rights, to the Federal Council. He was less successful with the vexed question of the Prussian franchise, which in 1910 he attempted to solve by proposing a direct system of election while retaining in a modified form the local division of the electorate according to income-tax assessment into three classes. His bill was ultimately rejected by the reactionary Chamber of Deputies. This question was again to occupy him amid the stress of the war. Under the impression produced by the Russian Revolution of March 1917 he was constrained to inspire the "Easter message" of the Emperor as King of Prussia promising the abolition of the three-class system after the war, a proclamation which was followed in the same year by the edict of July 11 announcing that a bill would at once be introduced to enact equal direct and secret suffrage. This project of reform came too late to reconcile the revolutionary elements in the Prussian state. Bethmann Hollweg's political career ended immediately after the July edict, and, although a bill was introduced in the following Nov. by his successor, Count Hertling, the opposition of the Prussian Conservatives and other reactionary elements prevented it from passing before the revolution. He was equally unsuccessful in dealing with an outbreak of militarism in Nov. 1913 at Zabern in Alsace, where the population, exasperated by the truculence of a young officer, was subjected to the arbitrary exercise of martial law by the colonel in command of the garrison. Bethmann Hollweg's treatment of the incident satisfied neither the reactionaries nor the advanced parties, and, for the first time in the history of the Reichstag, a vote of censure was passed upon the Chancellor.

The foreign policy of Bethmann Hollweg was characterized by the indecision and half-heartedness which compromised his action in home politics. He shared the ambition of the Emperor and of the vast majority of his countrymen to set Germany at the head of Europe and to establish her influence throughout the world by the predominance of her commerce and industry and by the ubiquitous activity of her diplomacy supported by her preponderating military strength. In his speeches during the war the declaration "we must secure from the military and the political and also from the economic point of view the possibility of our expansion" is characteristic and recurs in various forms. In this sense he could truly have said "We could have got all we wanted without war," *i.e.* by establishing Germany's power in Europe, on the seas and beyond them in a way that would make her unassailable whatever her policy and action might be. What he could not realize was that the creation and maintenance of vast armaments, combined with the aggressive behaviour of those sections of German opinion which always asserted their influence in public affairs and the truculent tone of the Emperor's frequent public utterances, compelled Germany's neighbours, including Great Britain, to concert measures for meeting the imminent eventuality of active German and Austro-Hungarian aggression. He maintained, like many of his countrymen, that the Triple Entente was the arbitrary and artificial creation of the personal policy of King Edward VII., acting in accord with the feelings of commercial and political jealousy with which Germany's successes were thought to have inspired the British people. He himself, however, had much to endure before and during the war from the intrigues of the

military party, in particular from the hostility of the creator of the German navy, Admiral von Tirpitz, who was once and again put forward by the more aggressive chauvinists as their candidate for the chancellorship. But Bethmann Hollweg himself did not see that the influence of that powerful section of German opinion and its action in military and naval as in foreign policy furnished ample justification for such measures of precaution as the Western Powers and Russia concerted, measures which, indeed, proved hardly adequate to confront the first German onset in 1914.

The renewed conflict with France over Morocco in 1911, the dispatch of the gunboat "Panther" to Agadir, the consequent friction with Great Britain and the prolonged negotiations which led to the mutually unsatisfactory Franco-German Morocco agreement, mainly fell within the province of Bethmann Hollweg's able subordinate, Herr von Kiderlen-Waechter, who at that time was Secretary of State at the Foreign Office. Here, as on other occasions, the Chancellor was probably pacific in his intentions, but in the means which were adopted to secure Germany's objects he showed either lack of judgment or inability to control his political and military subordinates.

In his book *Betrachtungen zum Weltkrieg* (*Reflections on the World War*), written in his retirement at Hohenfinow after the collapse of Germany, he gives an account of the exchange of views which took place between him and Lord Haldane during the latter's visit to Berlin in Feb. 1912. This account ought to be read in conjunction with Lord Haldane's own report of his visit,[1] particularly with regard to the attempt of the two statesmen to find a formula for a treaty of mutual assurance calculated to allay apprehensions of war between Great Britain and Germany. Bethmann Hollweg wished to obtain an engagement from Great Britain to observe a benevolent neutrality in the event of Germany's becoming "entangled in a war with one or more other Powers," or, as he finally formulated it, "if war should be forced upon Germany." His conception of a war "forced upon Germany" was subsequently revealed by his defence of Germany's declarations of war upon Russia and France, accusing the one Power of having rendered war unavoidable by its precautionary measures of mobilization and the other of having opened hostilities by air raids which never took place. In the exchange of views regarding the German and British naval programmes Lord Haldane received the impression that Bethmann Hollweg was pursuing a different policy from that of Admiral Tirpitz, but that the latter had the support of a powerful and certainly active party in the country and was able to get his way. Indeed, Bethmann Hollweg himself says in his book that "when differences arose between the Admiralty and the civilian leadership public opinion was almost without exception on the side of the Admiralty." There were from time to time evidences of a similar lack of continuous agreement and coördination between the policy of the Chancellor and that of the Secretaries of State in other departments, while the views of the Emperor William II. himself were notoriously liable to sudden and incalculable change. In a marginal note on one of the diplomatic documents of July 1914, the Emperor contemptuously referred to Bethmann Hollweg as the "civilian Chancellor," as if policy were the business of the generals. Yet the Chancellor was in evident agreement with the Emperor's view that it was legitimate for Austria, backed by Germany, to alter the balance of power in the Balkans and to put an end to the traditional and national Russian policy of protecting the small Slav nations. Germany's "expansion" in the Near East was similarly to be promoted and her supremacy at Constantinople established at the expense of Russia's interests in a sphere that was vital for the Russian Empire.

The interview between the British ambassador, Sir Edward Goschen, and the German Chancellor, at their parting immediately before the declaration of war in 1914, when the latter in the course of "a harangue which lasted for about 20 minutes" spoke of the international treaty guaranteeing Belgium's neutrality as a "scrap of paper" and asked whether the British Government had considered "at what price that compact would have been kept," furnishes the crowning evidence of Bethmann Hollweg's essentially Prussian conceptions of political morality. "In the moment of anger the true man stood revealed. . . . To break a treaty pledging the national honour seemed a natural thing to him, if to keep it involved sacrifice and danger . . . Herr von Bethmann Hollweg evidently thought that a plighted promise need not be kept, if the engagement involves momentous and unpleasant consequences. Not only does it throw the most unpleasant light upon his own notions of honour, but it makes the commentator ask whether it was possible to make any permanent settlement with a nation whose leading statesman obviously held the view that any treaty was only to be kept so long as it was profitable to the signatory parties."[2]

There is evidence that at the time when Germany broke the peace Bethmann Hollweg was in a state of extreme nervous tension, due probably as much to the sense of the moral quicksands on which Germany's case was based as to the collapse of all his calculations regarding the effect of his policy upon the other Great Powers. In the case of Great Britain his disillusionment was complete and confessed. In the case of Russia he had apparently hoped that a display of firmness would bring about the same public renunciation of Russian policy which Germany had been able to secure by the "bluff" of 1908–9 in connexion with the Austrian annexation of Bosnia and Herzegovina. The Austro-Hungarian ambassador Count Szögyeny's report of his interview with William II. on July 5 is to the effect that in the event of action against Serbia the Emperor Francis Joseph could rely upon Germany's support and "he had not the slightest doubt that Bethmann Hollweg would entirely agree with this view. . . . Russia's attitude would be hostile, but William II. had for years been prepared for this war, and, should it ever come to war between Austria and Russia, we could be convinced that Germany with her customary loyalty to the Alliance would stand at our side." In subsequent conversation with Bethmann Hollweg Count Szögyeny "ascertained that the Imperial Chancellor, just like the Emperor William, regards immediate action against Serbia as the most radical and best solution of our difficulties in the Balkans. From the international standpoint he considers the present moment more favourable than later and agrees that we shall inform neither Rumania nor Italy [both allies] beforehand of our eventual action."

Admiral von Tirpitz[3] testifies that upon his mind the ultimatum to Russia and the declaration of war produced the impression of being ill-considered and due to a want of management. "Bethmann Hollweg was throughout those days so excited and irritable that it was impossible to converse with him. I can still hear him as with uplifted arms he repeatedly emphasized the absolute necessity of the declaration of war and put an end to all further discussion." He told Tirpitz that war must be declared because the Germans wished to send patrols across the frontier at once. Moltke, on the other hand, informed Tirpitz that there was no such intention and that "from his point of view a declaration of war was of no importance."[4]

During the war period of Bethmann Hollweg's chancellorship (Aug. 1914–July 1917) his public speeches were designed to create the impression of Germany's invincibility. He was accused by his political adversaries of having all the time entertained the secret hope of coming to a separate understanding with Great Britain and of having influenced military and naval policy through the Emperor with this object in view. In reality he never approximated to the elementary conditions of peace terms with the Allies, and in respect both of Belgium and France constantly referred to guarantees in the shape of an extension of power (*Machtgrundlagen*) which would be a necessary condition of a settlement. "History," he said, "knows no instance of the *status quo ante* after such tremendous events"

[1] See *Before the War*, by Visct. Haldane (1920).

(speech of April 5 1916). On the question of unrestricted submarine warfare he ultimately divested himself of responsibility, having declared to the Emperor in Jan. 1917: "I can give Your Majesty neither my assent to the unrestricted U-boat warfare nor my refusal. I submit to Your Majesty's decision "[1] which was that of the General Staff and the Admiralty. He must have given his explicit assent to the monstrous note addressed on Jan. 19 1917 by his Secretary of State for Foreign Affairs, Zimmermann, to Mexico inviting her to attack the United States in the hope of annexing New Mexico, Texas and Arizona and to try to detach Japan from the Allied cause. His alleged high principles did not prevent him from associating himself with this scheme for a treacherous assault upon a Power with whom Germany was then at peace.

By the middle of July 1917 Bethmann Hollweg had lost all support in the Reichstag. The Conservatives and National Liberals were alienated by his Prussian franchise policy and his conflicts with the higher command. The Left and the Catholic Centre in which Erzberger with his so-called Peace Resolution (adopted by the Reichstag on July 19) had acquired the upper hand were convinced that the Allied and Associated Powers would place no confidence in the overtures of men with the past of Bethmann Hollweg and Zimmermann. Finally, on the morrow of the publication of the second Prussian Franchise Edict, on July 14 1917, Hindenburg and Ludendorff came to Berlin in order to hold conferences with the chiefs of political parties regarding the terms of the "Peace Resolution." The Chancellor could not tolerate this military interference with his own department, and the Emperor, confronted with an ultimatum from his two indispensable military leaders, accepted the Chancellor's resignation. Bethmann Hollweg retired to Hohenfinow and took no further part in politics beyond writing his *Reflections on the World War* (vol. i. 1919). He died, at Hohenfinow on Jan. 1 1921, after a brief illness. (G. S.)

BEYERS, CHRISTIAN FREDERICK (1869–1914), S. African general, was born in Cape Colony in 1869 and went as a young man to the Transvaal, where he took a prominent part on the Boer side in the S. African War, winning high distinction in the field and bearing the rank of general when peace was made in 1902. Gen. Beyers had much influence, as soldier and statesman, among the Dutch-speaking people of S. Africa, and was, with Gen. Botha and Gen. Smuts, though in a less degree than they, one of the recognized leaders of the Transvaal Dutch. When responsible government was granted to the Transvaal, Beyers became speaker of the Lower House. He showed in the speaker's chair remarkable gifts. He was acute, tolerant and rigidly impartial, thus making a deep impression upon English-speaking S. Africans, who would have supported his claims to be the first speaker of the first S. African House of Assembly, had they been pressed by Gen. Botha, the first Prime Minister. Instead, Beyers was made commandant-general of the Citizen Forces of S. Africa, and in that capacity paid a visit to Great Britain, Germany, Switzerland and Holland in 1912. A man of fine physique, of passionate nature, and of profound religious convictions, Beyers, as commandant-general of S. Africa, was entertained with marked attentions during his visit to Germany by the Kaiser. When the World War broke out, he set himself in almost open opposition to the policy of the Botha Government. For some months this opposition smouldered. Then, at a moment when the S. African expeditionary force was being mobilized for the invasion of German S.W. Africa, and when rebellion was already smouldering among the irreconcilables of the S. African Dutch, Beyers resigned his post as commandant-general in a letter addressed to Gen. Smuts, then Minister of Defence, and published in *Het Volk*, an anti-Government journal. In this letter he declared that he had always disapproved the Government's intention to invade German S.W. Africa and that this disapproval was shared by the great majority of the Dutch-speaking people of the Union. Gen. Smuts replied in a stern letter declaring that the war was a test of the loyalty to their pledged word of the Dutch-speaking people, and accepting Beyers' resignation. A few weeks later Beyers took the field as a leader of the rebellion against the Government, only to be overwhelmed by the Government troops under the command of Gen. Botha, to be driven from pillar to post as a fugitive, and to be drowned on Dec. 7 1914 while trying to escape from his pursuers by crossing the Vaal river. His body was recovered two days later, and with his death the rebellion was brought to an ignominious end.

[1] Scheidemann, *Der Zusammenbruch*, p. 74.

BHOWNAGGREE, SIR MANCHERJEE MERWANJEE (1851–), Indian parliamentarian, the son of a Parsee merchant of Bombay, was born in Bombay Aug. 15 1851, and began life as a journalist, but when only 22 was appointed, on the death of his father, to succeed to the Bombay agency of the Kathiawar state of Bhavanagar. Called to the bar at Lincoln's Inn in 1885, in the following year the Maharaja appointed him judicial councillor, a post in which he introduced far-reaching reforms. Settling in England in 1891, he actively associated himself with public bodies connected with India. He was the head of the Parsee organization in Europe and chairman of the Indian Social Club. To the Imperial Institute building he contributed, in memory of his only sister, the eastern colonnade leading to the Indian section. His compatriot Dadabhai Naoroji was in the 1892–5 parliament, but Bhownaggree, elected in the latter year in the Unionist interest for N.E. Bethnal Green, was the only other Indian to enter the House of Commons, and the only one to be reëlected (1900). During his ten years there he impressed the House by the vigour and eloquence of his speeches on Indian matters, and he originated and unflaggingly maintained in and out of the House the long battle against the disabilities of Indians in South Africa and other overseas dominions of the Crown. His cogent and detailed statement of the case for Indians in the Transvaal after annexation was the basis of a blue-book (Cd. 2239, 1904), and was sent to Lord Milner by the Colonial Secretary, Alfred Lyttelton, with the observation that he felt much sympathy for the views expressed, and that it would be difficult to give a fully satisfactory answer. The practical result was that the proposals of the High Commissioner were in some important particulars rejected. Bhownaggree was one of the first Indians to press forward the need for technical and vocational education in India side by side with the literary instruction which was too exclusively maintained. He was made a C.I.E. in 1886 and K.C.I.E. in 1897. In early life he wrote a history of the constitution of the East India Company, and made a Gujarati translation of Queen Victoria's *Life in the Highlands*. During the World War he assisted in repelling German falsehoods regarding British rule in India by means of a widely circulated booklet entitled *The Verdict of India*.

BIGELOW, JOHN (1817–1911), American diplomat and journalist (*see* 3.922), died in New York Dec. 19 1911. In 1909 he published three volumes of *Retrospections of an Active Life*, covering his career to 1866. Two additional volumes, ending with 1879, were issued by his son (1913).

BIKANER, SIR GANGA SINGH, MAHARAJA OF (1880–), Indian soldier and statesman, was born Oct. 3 1880, and succeeded by adoption his elder brother, Dungar Singh, in 1887 as 21st ruler of the state. After education at the Mayo College, Ajmere, he was invested with full powers in 1898, and promptly showed energy and skill in their use in combating the great famine of 1899–1900. In the Chinese campaign of 1901 he accompanied the British contingent in command of his famous Camel Corps, the Ganga Risala, which also did good service in Somaliland in 1903. The first of his many visits to England was made in 1902, when he attended King Edward's coronation, and was made A.D.C. to the Prince of Wales, an appointment continued by King George when he came to the throne. In the World War the Maharaja offered the whole resources of the state and served first on the headquarters staff of the Meerut division in France, and later on the staff of the British commander-in-chief. In 1915, at the head of his Camel Corps, he took part in the fighting to withstand the Turkish invasion of Egypt. In 1917 he and Sir S. P. (afterwards Lord) Sinha were the first Indians to be called to London for Empire gatherings. They were members of the Imperial War Confer-

ence and assisted the Secretary for India at the Imperial War Cabinet. The Maharaja's public speeches attracted marked attention, and were collected under the title of *India's Imperial Partnership*. His warm sympathy with Indian aspirations of self-government within the Empire made the greater impression on public opinion because of the notable moral and material progressiveness and efficiency of his administration in Bikaner, and his constitutional reforms. He was selected to represent the Indian states at the Peace Conference and the Imperial Cabinet meetings in connexion therewith, and at Versailles on June 28 1919 he affixed the first Indian signature to a great international treaty. Keenly concerned to uphold the rights and dignities of the ruling princes, he formulated their views with force and skill, and his was the dominant personal influence in securing the constitution, under royal proclamation, of the Chamber of Princes in 1921 as a deliberative, consultative and advisory body. His appointment as chancellor, carrying the presidency of the small standing committee, was indicative of the intellectual ascendancy he had acquired in the deliberations of the rulers. He had made himself well known as a sportsman, and in 1920 the "record" tigress (9 ft. 7 in.) fell to his gun. A major-general of the British army, his honours included the grand crosses of the Victorian and the two Indian Orders, the knighthood of the Bath, the honorary doctorate in laws of Oxford, Cambridge and Edinburgh and the freedom of London, Edinburgh, Manchester and Bristol. His permanent local salute was raised from 17 to 19 guns. (F. H. Br.)

BILHARZIOSIS (*see* 3.932).—The complete elucidation of the cause, mode of transmission, prevention and cure of this disease (*Schisostoma haematobium*) was one of the triumphs of medical progress during the decade 1910–20. In 1913–4, in his annual report on Egypt, Lord Kitchener said: "It is high time that some steps should be taken to prevent the continuity of infection which has been going on so long in this country." At that time Egypt was a hot-bed of the disease, and so were many areas of South Africa. Indeed some 625 British soldiers were infected during the Boer War of 1899–1902, and of these in 1914 no fewer than 359 were still on the sick-list.

Early in the World War, when British troops were dispatched to Egypt, Sir Alfred Keogh, director-general of the A.M.S., sent a mission there to investigate bilharziosis. At the head of it was Lt.-Col. R. T. Leiper, helminthologist to the London School of Tropical Medicine. Leiper's object was to discover the intermediate host of the parasite which is the cause of this disease. The parasite itself had already been discovered, as early as 1852, and was called after its discoverer T. Bilharz, a German. There was, moreover, some reason to suppose that a portion of its life-history was passed in the body of a fresh-water mollusc, this being a usual cycle among trematode worms (*see* 27.240). Leiper adopted the simple measure of engaging a large number of native boys and paying them to collect all the molluscs they could find. The boys brought in large quantities, and the research workers set themselves to examine them. Within a very short period the parasite of bilharziosis was found in the body of one variety, a water-snail which inhabits canals and pools and is thus found "at spots daily frequented, such as the praying ground at the embankment crossing, in front of the cafés, and at the bend of the canal daily used for washing." The next step was to discover whether animals could be infected experimentally. Leiper observed that rats and mice and other vermin were notably scarce in the regions infested by the snails. A professional rat-catcher was employed but he failed to secure any animals. On June 13 1915 the first positive result was obtained when a rat was experimentally infected. Various experiments were now undertaken to determine the mode of infection of human beings. It was found that both drinking and bathing are dangerous for the free-swimming parasites. "Cercariae," after they have been born from the body of the water-snail, are so provided that they are able to pierce the human skin and so enter the body. Happily they live only 36 hours after birth in the pools, dying thereafter unless they find a suitable host.

The life-history of the parasite is therefore a double one. It lives in the bodies of men from which it is passed to water where it enters the water-snail's body. From this after six weeks it is hatched in the free-swimming form and then re-enters the bodies of men. The snail is safe until six weeks from its first infection have elapsed. It retains its powers of dissemination over considerable periods. The following conclusions were formulated:

1. Transient collections of water are quite safe after recent contamination.
2. All permanent collections of water such as the Nile canals, marshes and *birkehs* (pools) are potentially dangerous, depending on the presence of the essential intermediary host, the snail.
3. The removal of infected persons from a given area would have no effect, at least for some months, in reducing the liability to infection, as the intermediate hosts discharge infective agents for a prolonged period.
4. Infected troops cannot reinfect themselves or spread the disease directly to others. They could convey the disease to those parts of the world where a local mollusc could efficiently act as carrier.
5. Infection usually takes place both by the mouth and through the skin. Recently contaminated moist earth or water is not infective.
6. Infection in towns is acquired from unfiltered water, which is still supplied even in Cairo, in addition to filtered water, and is delivered by a separate system of pipes.
7. The eradication can be effected without the coöperation of infected individuals by destroying the molluscan intermediaries.

The irrigation work in Egypt being in the hands of the Government, it is possible to have the pools in which the snails breed drained and dealt with. Along such lines, at least, lie the preventive measures which will in course of time be instituted. Through Leiper's work, therefore, this disease may be regarded as much less of a menace than it has ever been formerly.

The great success which attended this work caused other investigators to turn their attention to the disease and to begin the search for a cure. Many remedies had, of course, been tried, but none of these could be guaranteed to eliminate the parasites and so to end the mischief. It occurred to Dr. J. B. Christopherson to apply to this disease the method of using antimony tartrate which had been employed with success in the treatment of the Indian disease kala-azar. This consists in giving the antimony by injection into a vein. Christopherson soon found that his idea was to be relied on and that the effect far exceeded his hopes. The parasites and their ova were killed off and the patients became entirely free of the disease. This work has now passed beyond the stage of experiment, and Christopherson's treatment is universally acknowledged to be a complete cure of bilharziosis.

Thus this formidable disease has been conquered. Its means of transmission are known. Its prevention is only a matter of time. Its cure is a matter of certainty. (R. M. Wi.)

BINYON, LAURENCE (1869–), English poet (*see* 3.952), produced after 1910 a book on Botticelli (1913); a catalogue of Japanese woodcuts in the British Museum (1917); *The Art of Asia* (1915); *English Poetry in Relation to Painting and other Arts* (1918); *For Dauntless France* (1918) and *Court Painters of the Great Mogul* (1920); as well as certain collections of poems, *Auguries* (1913) and *The Four Years* (1919), the last of which gathered together his fine war poems, which had previously appeared in several smaller collections. In 1920 his play *Sakuntala* was performed in London.

BIRDWOOD, SIR GEORGE CHRISTOPHER MOLESWORTH (1832–1917), Anglo-Indian writer (*see* 3.979), died at Ealing June 28 1917.

BIRDWOOD, SIR WILLIAM RIDDELL, Bart. (1865–), British general, was born Sept. 13 1865. He joined the 12th Lancers in 1885 and was in the following year transferred to the Indian staff corps, joining the cavalry. He served in the Hazara expedition of 1891 and the Isazai expedition of 1892, and in the 1897–8 frontier war. He was sent to South Africa in 1899 and served on the staff there during the whole of the war, the close of which found him a brevet lieutenant-colonel. He was afterwards closely associated for several years with Lord Kitchener in India, acting as his military secretary. In

1908 Birdwood, now a full colonel, held the position of chief staff-officer during the operations against the Mohmunds, for which he received the D.S.O., and he was a brigade-commander in India from 1909 to 1912. He had been promoted major-general in 1911; and in 1912, after holding for some months the position of quartermaster-general at Simla, he was appointed Secretary in the Army Department. Lord Kitchener in Dec. 1914 selected him for the command of the Australasian forces which were being assembled in Egypt, and in the following April he commanded the army corps from the Antipodes which carried out the memorable landing at Anzac. He was in charge of the troops clinging to this patch of the Gallipoli Peninsula until Aug., and he then directed the unsuccessful offensive that was attempted from it. His personality had made him much liked and respected by the Australasian troops. After the change that took place in the control of the Mediterranean field force in Oct., Birdwood (who had been awarded the K.C.M.G. and had been promoted lieutenant-general) assumed charge of the forces operating at the Dardanelles, and he carried out the very successful withdrawal of the troops from their dangerous positions in the following December and January. After a short period in Egypt he took his Australasian troops to the western front, and he commanded them there for two years; he was given the K.C.B. and promoted general in 1917. On the reconstitution of the V. Army after the great German effort of the spring of 1918 had been checked, Sir William Birdwood was selected to lead it, and his troops bore an important part in the last phases of the British advance in the autumn. For his services he was made a baronet and a G.C.M.G., besides receiving a grant of £10,000. He paid a visit to the Antipodes a year after the war and received a great welcome; in 1920 he took up command of the northern army in India.

BIRKENHEAD, FREDERICK EDWIN SMITH, 1st Viscount (1872–), Lord Chancellor of Great Britain, the son of a barrister, was born at Birkenhead July 12 1872, and was educated at the local school, whence he proceeded with a classical scholarship to Wadham College, Oxford. He gained a first class in jurisprudence in 1895 and was Vinerian Law Scholar in 1896, was elected a Fellow of Merton and did a considerable amount of educational work in the next few years, being a lecturer both at Merton and at Oriel, and an extension lecturer in modern history both for Oxford and for Victoria University. But his attention was mainly directed to law and public life. He had been president of the Union at Oxford, and he entered at Gray's Inn, being called to the bar in 1899. He went the northern circuit, and attached himself to the local bar at Liverpool, where he rapidly obtained a considerable practice. He also published a book on international law, which has gone through several editions. He soon took a prominent place among the Conservatives of Liverpool as a decided Tariff Reformer, and was returned for the Walton division in Jan. 1906, holding the seat till his elevation to the Chancellorship in 1919. When he entered the House of Commons, he found himself a member of a small and discouraged minority, who had been soundly beaten at the general election, mainly on the issues of tariff reform, Chinese labour in the Transvaal, and religious education. He himself, though he had achieved considerable local reputation, was practically unknown in London. Within a week of the opening of Parliament he bounded into fame by a sparkling maiden speech in a Tariff Reform debate—a speech conceived in a confident fighting spirit, calculated to cheer dejected partisans, and full of wit and epigram. One of his phrases went home, when he described the majority as "begotten by Chinese slavery out of Passive Resistance." Mr. Lloyd George, who followed him in debate, spoke of the speech as very brilliant; and the Conservative party hailed him at once as a coming leader. He soon acquired a large practice at the bar in London, took silk in 1908, and became a bencher of his Inn. In Parliament, during the year of Opposition, he justified the expectations formed of him, but incurred the animosity of his opponents by the vehemence of his denunciation of ministerial schemes. He was chosen to move the rejection of the Parliament bill on the third reading in May 1911. In the crisis which followed he took an extreme view, was prominent in the disorderly proceedings when Mr. Asquith was refused a hearing in the House of Commons, and threw in his lot with the "Die-hards." At the coronation in that year his growing reputation in Parliament was recognized by his admission to the Privy Council; and in 1912 he appeared as an acknowledged leader of the party, moving the Opposition amendment to the Address, and the rejection of the Welsh Disestablishment bill on second reading. He showed, moreover, as a Liverpool man, his strong sympathy with Ulster, threatened by the Home Rule bill; he went over to Ireland and constituted himself Sir Edward Carson's principal lieutenant in the resistance which he was organizing in North-East Ulster against Home Rule.

When the World War broke out, he was one of the first Opposition leaders to place his services at the disposal of the Government. He accepted the position of head of the Press Bureau, and in that capacity encouraged, with a view to accelerate enlistment, the publication in *The Times* of Aug. 30 1914 of a telegram showing the serious plight of the British army after the retreat from Mons. But he went shortly afterwards to France on active service, with the Indian Corps, and was mentioned in despatches. He was captain in the King's Own Oxfordshire Hussars, and a temporary lieutenant-colonel in the army. When the first Coalition Ministry was formed in May 1915, he was appointed Solicitor-General and knighted, and he succeeded Sir Edward Carson in November as Attorney-General, a post he held till 1919. The Defence of the Realm Act and other war-time measures threw in these years a great burden of anxious work on the law officers of the Crown, including the prosecution of Sir Roger Casement for high treason at the Old Bailey. In the autumn of 1918 Sir Frederick Smith undertook a visit of propaganda to the United States, and published a book about it on his return. When Mr. Lloyd George reconstructed his Ministry after the general election of Dec. 1918, the Attorney-General was appointed Lord Chancellor and created a peer. The appointment, though quite in the normal course of promotion, was subjected to considerable criticism, owing partly to his comparative youth, but chiefly to his vehement partisanship in earlier years. But it was soon admitted (and notably by his colleagues on the judicial bench) to have been amply justified. Lord Birkenhead brought to the performance of his new duties the vigour which had always been characteristic of him; his judgments in the two final Courts of Appeal were weighty and lucid; and he quickly made himself a force in the Lords' debates. His zeal for the efficient administration of justice caused him, in addition to his other heavy work, to sit during several weeks in the spring of 1921 as a judge of first instance, in order to clear off the enormous arrears in the Divorce Court. He was created a viscount on the King's birthday in that year.

He married, in 1901, Margaret Eleanor, daughter of the Rev. Henry Furneaux, a well-known Oxford scholar, his family consisting of a son and two daughters. He was always a man of much physical activity, fond of a horse, of field sports and games, and of yachting.

BIRMINGHAM, GEORGE A., pen-name of James Owen Hannay (1865–), Irish novelist and playwright, who was born July 16 1865 at Belfast. He was educated at Haileybury and Trinity College, Dublin, was ordained and became a canon of St. Patrick's, Dublin, in 1912. He wrote amongst other novels: *The Seething Pot* (1905); *Spanish Gold* (1908); *Lalage's Lovers* (1911); *The Red Hand of Ulster* (1912); *The Lost Tribes* (1914) and *Inisheeny* (1920), whilst among his plays the best known is *General John Regan*, which was successfully produced at the Apollo theatre, London, in Jan. 1913.

BIRMINGHAM, England (*see* 3.983).—During 1910–21 the city of Birmingham greatly increased in size and importance. The primary cause of its growth in area was the extension of the municipal boundaries by a local Act of Parliament, though manufacturing enterprise and industrial developments before the World War, as well as the extraordinary influx of munition

workers in 1914–8, materially contributed to the increase in the population. For the purposes of the report of the medical officer of health published in 1920, the population was estimated to be 910,000. When the census was taken in 1911 the males over 18 years of age numbered 246,881 and the females 283,366. Just prior to the Armistice the number of men of or over military age in the city had been reduced to 200,251, while the number of women residing in the city had increased during the war to 323,911. The war probably accounts largely for the falling-off in the birth-rate during the same period. In 1913 the rate was 27·3 per 1,000 and in 1918 the figure was 19·4. The intervening years show proportionate decreases. There were 19,335 babies born during 1919. This is equal to a birth-rate of 20·0 and indicates an upward tendency, though the increase of population is due more to the improvement in the death-rate than to the recovery of the birth statistics.

The Greater Birmingham scheme, the prospect of which in 1910 had greatly disturbed the authorities of the counties of Warwick, Worcester and Stafford, became an accomplished fact in 1911. Although the area taken into the city included a considerable amount of agricultural and undeveloped land in the county of Worcester, the residential suburbs annexed to the city in 1911 were mainly populated by people who derived their incomes, as well as their water, gas, electricity and other urban amenities, from the city.

The borough of Aston Manor, the urban districts of Erdington and Handsworth, almost all of the urban district of King's Norton and Northfield, and the rural district of Yardley were added to the city at this time. King's Norton and Northfield, as parts of Birmingham, ceased to be portions of Worcestershire from the geographical as well as from the administrative aspect, and came nominally within the new boundary of Warwickshire, as did Handsworth, from Staffordshire.

The area of the city was increased from 13,477 ac. to 43,537 ac., or about 68 sq. m., and the rateable value of Birmingham rose automatically from £2,063,711 to £4,340,017, leaving out of account the differential rate for various periods granted to certain of the added areas.

The membership of the city council was at the same time increased to 30 aldermen and 90 councillors, representing 30 wards. Judged by municipal standards, Birmingham was in 1921 the largest city in England.

Public Health.—In the decade immediately preceding the war the death-rate was 14·8 per 1,000, and for the five years from 1915 the figures declined from 14·4 to 13·0 in 1919. The death-rate was in 1921 the lowest but one among the large towns of Great Britain. One of the principal causes of Birmingham's comparatively clean bill of health, and the decline in infantile mortality, is the employment by the health committee of a large and highly organized staff of lady health visitors. The city is divided into four quarters, each of which is under the supervision of an assistant medical officer of health or a lady doctor, the latter specializing in maternity and child-welfare work. The Corporation also employs specialists in tuberculosis, who have urban dispensaries and country sanatoria in their charge. The lady health visitors include 13 who have charge of tuberculosis cases, 19 who deal with the general health of certain congested areas, and 54 who are specially concerned with infant welfare, making a total of 86 lady health visitors.

Housing.—In Oct. 1919 the Corporation submitted a return to the Local Government Board showing that 14,000 new houses were at that time required to meet the unsatisfied demand, and that 50,000 new houses would be required to rehouse persons displaced by the clearance of insanitary areas, and to replace other dwellings which fell definitely below a reasonable standard. Prior to that date, however, the Corporation (July 1918) formulated a policy for dealing with the housing question and a number of proposals then suggested were incorporated in a local Act and in the Government's Housing Act of 1919. In the following winter the Corporation acquired approximately 1,050 ac. of land upon which some 10,000 houses could be erected. Other large estates were subsequently purchased, and the Corporation was in 1921 in possession of about 1,930 ac. of land for housing purposes. This land would accommodate from 19,000 to 20,000 houses. In Sept. 1919 a housing director was appointed and a considerable proportion of the houses had in 1921 been completed and occupied. Difficulty was found in obtaining a satisfactory supply of labour and materials. This not only delayed completion of the houses but seriously affected the cost of erection, the average for the first four schemes being about £900 per house; the cost of the land and other expenses brought it up to over £1,000. By the end of Jan. 1921, contracts were placed for 2,386 workmen's dwellings. Of these 180 houses were built by direct labour. The Corporation also converted army huts at Castle Bromwich into dwellings for about 100 families.

Town Planning.—Birmingham was the first large town in England to prepare a comprehensive scheme of town planning. Important pioneer work in this direction was done by Mr. J. S. Nettlefold when he was chairman of the Birmingham housing committee, before the passing of the Town Planning Act of 1909. No definite steps to carry out this scheme were possible until the extension of the city in 1911, when 24,000 ac. of undeveloped land in the suburbs were brought under the control of the city council and Mr. Neville Chamberlain became chairman of the town-planning committee. The first town-planning scheme authorized by the Local Government Board related to Harborne and Quinton, and dealt with 2,320 ac. on the W. side of the city. The future line of main roads was defined, some of them being 100 ft. wide, and the owners of the adjoining land were notified that they would have to conform to a general layout affecting the construction and character of the side roads (which may be narrower and less expensive) and the number of houses and kind of buildings to be erected in the area. Open spaces and corner sites were reserved. No factories were provided for in this area, but considerable space was reserved for them in the E. Birmingham town-planning scheme (1,443 ac.), where the greater part of the property is already industrial and the prevailing winds blow the smoke away from the city. These two schemes were approved in 1913. The N. Yardley scheme of 3,176 ac. and the S. Birmingham scheme of 8,267 ac. were prepared before the war and approved in 1916. A supplementary scheme for S.W. Birmingham, involving an area of 9,866 ac., was launched after the war. The public works and town-planning committee also prepared tentative plans for improving the built-up area in the centre of the city, and widening the arterial roads. They have experimented with a sleeper tramway track between two carriage ways, with wide grass margins and avenues, and are providing specially for fast-travelling vehicles on a ring road and arterial roads, which are to be widened to 100 ft. or more. The first sections of road so widened were completed in 1915 at Edgbaston and Harborne. The scheme includes the widening of 43 m. of radial main roads and the construction of 7 m. of new roads. During the trade slump of 1920–1 large numbers of unemployed were engaged in this work of road widening and the construction of new roads. Similar labour was employed in laying out a municipal golf course in the park known as Warley Woods and another course on land given by members of the Cadbury family on the Lickey hills. Another important addition to open spaces around the city is Barr Beacon given by Col. J. H. Wilkinson during the World War.

New Buildings.—The building of the new municipal offices and art galleries on a portion of the Colmore estate, bounded by Edmund St., Congreve St., Gt. Charles St. and Margaret St., which began in 1906, was completed in 1912. The offices of the gas, health, tramways and education departments were transferred from the old council house to the new premises and the rooms thus vacated were utilized for the accommodation of the water department, public works department, town clerk's department, salvage department, parks department and the new Municipal Bank.

A legacy of £50,000 from Mr. John Feeney, who had been a generous donor to the museum and art gallery, was utilized for the erection of a handsome suite of picture galleries and a museum of casts over the new municipal offices and connected with the old art gallery by a bridge across Edmund Street. The natural history museum was established at the same time, and a unique collection of British birds with their nests and perfectly natural surroundings was provided as a memorial to the late Alderman C. G. Beale. The first of the new Feeney galleries is devoted to the work of modern English painters and contains some of the larger pictures, such as Millais' "Widow's Mite," Lord Leighton's "Condottieri," Henry Moore's "Newhaven Packet," "Autumn" by Sir L. Alma-Tadema, "The Village Philharmonic" by Stanhope Forbes, "Hayle from Lelant" by Sir Alfred East. Gallery II. contains old masters and portraits of local worthies, including excellent examples by Reynolds and Gainsborough. The next three galleries are filled with works of the English pre-Raphaelites, notably those of Sir Edward Burne-Jones, a native of Birmingham. This collection, both in size and importance, is unrivalled. Another interesting gallery is No. VII., which includes Turner's beautiful drawing "Schaffhausen," from the Ruskin collection, and other important water-colours. A large collection of drawings by David Cox and other local artists is in galleries VIII. and IX. The old galleries are now mainly devoted to decorative and industrial art, including the Feeney collection of nearly 2,000 pieces and several important collections on loan. One of the new galleries is reserved for loan exhibitions of pictures.

In 1914–6 a new parcel post-office was erected on the site of the old Inland Revenue office in Paradise Street. This severely plain structure, built by the Office of Works during the war, is connected with the post-office in Victoria Sq. by a massive stone bridge across the top of Hill Street. The Inland Revenue offices were transferred to Empire House, Gt. Charles Street. The galleries

of the Royal Society of Artists were rebuilt on modest lines, and the classic portico which was a striking architectural feature of New St. disappeared to make room for utilitarian shop fronts. Queen's College remains an ornament to Paradise St., though it was used in 1921 mainly for commercial purposes instead of for theological training, owing to the exigencies of ecclesiastical finance. The Repertory theatre in Station St. was erected in 1913 through the munificence of Barry V. Jackson, founder of the Pilgrim Players, and the enthusiasm of John Drinkwater, the playwright.

"Highbury," Moor Green, formerly the residence of Mr. Joseph Chamberlain, and the adjoining residence, "Uffculme," the home of the late Mr. Richard Cadbury, were during the war converted into orthopaedic hospitals for disabled soldiers. When they ceased to be under the control of the Ministry of Pensions they were to revert to the Corporation as gifts from Mr. Austen Chamberlain and Mr. Barrow Cadbury. "Sorrento," Wake Green Rd., Moseley, was acquired by the citizens' committee during the war for the treatment of paraplegic war pensioners. The Princess Mary Convalescent Centre for Disabled Soldiers is at Rednal, and one of the city asylums at Rubery was still occupied in 1921 by the Ministry of Pensions for orthopaedic cases. The old Children's Hospital in Broad St. was used for various Government purposes during the war, and larger premises were provided by voluntary contributions, with up-to-date equipment for the treatment of sick children, in Ladywood Road. A hospital for nervous diseases was established after the war at Edgbaston.

Libraries.—Several important additions have been made to the public libraries of the city. In addition to the central reference and lending libraries, which adjoin the Midland Institute, there were in 1921 21 branch lending libraries and news-rooms, two branch reference libraries, a reading-room at Witton and a delivery station in the outlying district of Quinton, as well as a new commercial library and a patent library in the council house. The central reference library contains nearly 300,000 volumes, including the well-known Shakespeare Memorial Collection of 17,000 volumes, of which a separate catalogue was printed in 1903; the Birmingham collection, of which a 1,140-page catalogue was published in 1918, a collection of poetry relating to the World War; the Sir Benjamin Stone collection of photographs; large Byron, Milton and Cervantes collections and a collection of manuscripts and other relics of Boulton and Watt.

The lending libraries contain nearly 250,000 volumes, the annual users numbering about 2,300,000. The lending libraries were in 1921 being converted to the open-access system. An important innovation is the commercial library, containing about 3,000 volumes, the collection of trade catalogues and files of 220 periodicals, which was opened at the end of the war.

Municipal Bank.—The Municipal Bank, which was established mainly through the efforts of Mr. Neville Chamberlain when he was lord mayor, loaned £300,000 to the Government during the war, this amount being invested in small sums by 30,000 depositors, who were all employed persons. Owing to the opposition of the joint-stock banks through their parliamentary representatives in 1915, the operations of the bank were severely limited during the war, but its success in promoting thrift among the working-classes induced Parliament to extend its powers in 1919 and in that year over £300,000 was transferred from the war-time organization to a permanent municipal institution, the first of its kind in England.

The University.—A new chapter in the history of the university of Birmingham began with the visit of King Edward VII. and Queen Alexandra to open the new buildings at Edgbaston on July 7 1909. The site, given by Lord Calthorpe, the principal landlord of the district, comprises 40 ac., near the Bourn Brook and about 3 m. from the Mason College (in the centre of the city) where the faculties of art, medicine and the department of education are still carried on. The new buildings designed by Sir Aston Webb, mainly for the technical side of the university, cover a large semicircle and its diameter, with a central tower 325 ft. high, erected to commemorate the foundation of the university by its first chancellor, Mr. Joseph Chamberlain. The great hall and workshops, laboratories, model mine and power station for the engineering and allied departments were lavishly equipped to meet the special needs of the district, but the financial stringency arising out of the war has prevented the erection of the other large buildings necessary to make the design symmetrical, and to complete the accommodation for the chairs contemplated when the scheme was launched. The faculties of sciences (pure and applied) and of commerce are now housed on the Edgbaston site.

In 1919 the Treasury grant was increased to £38,000; the city council now contributes £15,000 per annum; and in 1920–1 a public appeal for funds resulted in about £300,000 being raised for the purpose of reducing the debt on the university and to increase the efficiency of the existing departments, though the amount available for these purposes was reduced by the fact that about £147,000 of the above-mentioned total was ear-marked for special objects, some of which involved additional expenditure out of the university funds. The chairs, lectureships, etc., endowed since 1910 include physics, electrical engineering, metallurgy, town planning, agricultural zoölogy) a research department subsidized by the Board of agriculture), Russian, Italian and brewing. Some of these new endowments are attached to old professorships. For instance, Sir George Kenrick endowed the physics chair in memory of the late Prof. J. H. Poynting, who had occupied it ever since Mason College was opened in 1880, 20 years before the university charter was granted. Public subscriptions endowed the pioneer chair of electrical engineering, which thus became in 1913 a memorial to the first vice-chancellor (Alderman C. G. Beale). The chairs allotted to modern European languages are quite new and the appointment of a lady as Italian professor is also an innovation. The chamber of commerce was responsible for the establishment of a chair of Russian during the war. The school of brewing has been supported by the trade ever since the foundation of the university, but the chair was not permanently endowed until 1919.

Lord Robert Cecil succeeded the late Mr. Chamberlain as chancellor in 1918; Sir Gilbert Barling was elected vice-chancellor in place of the late Alderman Beale in 1914, and Mr. C. Grant Robertson, Fellow of All Souls College, Oxford, was appointed principal on the resignation of Sir Oliver Lodge in 1919. Other important recent events in connexion with the university were the granting by its council of 15 free entrance scholarships for Birmingham residents (1912); the erection of a women students' club adjoining Mason College (1914); the transformation of the new buildings into a military hospital, and the women's hostel into a nurses' home during the war; and the subsequent linking-up of Birmingham with Bristol and the northern universities for matriculation and parliamentary purposes. The library was in 1921 being reorganized and enlarged. The volumes accessible to students number about 100,000. The teaching staff increased from 117 in 1910 to 216 in 1920, and the number of full-time students from 958 to 1,754 in the same period. It is a distinctive feature of Birmingham among modern universities that it does not include in its membership part-time students, these being provided for at the Midland Institute and the Municipal Technical School. On the other hand the university gives generous help to the Workers' Educational Association, both through its governing body and through individual members of the teaching staff. The income of the university increased from £57,143 in 1910 to £114,434 in 1920 and its expenditure from £69,780 to about £118,320. In consequence of the generous response to the appeal made in 1921 the council and senate hoped to make further additions to the salary list and the curriculum in the near future.

Commerce and Manufactures.—After the war the Birmingham chamber of commerce entered into possession of the Colonnade hotel in New St., converted into a commodious suite of offices and conference-rooms. The enormous iron-and-glass structure erected by the Government on the Corporation playing fields at Castle Bromwich, for use in connection with the aerodrome established there during the war, provided in 1921 excellent accommodation for the Birmingham section of the British Industries Fair.

Other large buildings erected during the war facilitated the development of local industries. Fort Dunlop is an entirely new suburb occupied by the makers of tires, golf balls and other rubber goods. The new factories erected by large firms now amalgamated in the Vickers-Metropolitan group have been converted from the manufacture of tanks, Handley-Page aeroplanes, artillery limbers, ambulances and engines-of-war into the more peaceful occupations associated with the production of railway carriages, wagons and electrical apparatus of all kinds. Some idea of the revolution in local industries produced by the war may be gleaned from the fact that a Birmingham firm of penmakers in the early stages of the war contracted to produce 12 million cartridge clips and that another firm in the jewellers' quarter made 72 million army buttons in one year. Under the direction of a local munitions committee, before the establishment of the Ministry of Munitions, the smaller manufactories in the city were affiliated to the national shell factory at Washwood Heath, where the shells were produced in the rough and finished in the smaller workshops. The output of shells in Birmingham during the last two and a half years of the war was 15 millions. Fuses and munitions for quick-firing guns were produced in even larger quantities, the local engineers and cycle-makers being specially qualified for the precision work required for these munitions. The manager of the Birmingham gas department acted as secretary of the munitions committee, and also organized the manufacture of toluene as an ingredient for high explosives throughout the country. At the B.S.A. works 10,000 rifles and 2,000 Lewis guns per week were manufactured. From the returns of the Ministry of Munitions it appears that, although the weight of shells produced in Birmingham was not the heaviest on record, the number and variety of articles supplied for the use of the army, navy and air force in Birmingham was greater than in any other part of the country. Some of the smaller parts produced for engines-of-war by the local brass manufacturers were measured at the Government depots in thousands of millions.

War-time Activities.—During the first month of the World War three city battalions were raised by the Lord Mayor, and the recruits under the voluntary system overflowed into several other new battalions of the Warwickshire regiment. It is estimated that Birmingham contributed to the fighting forces of the nation at least 148,000 men. Over 11,000 Birmingham men were killed, and the long list of local military distinctions includes the names of 11 winners of the V.C. The amount of money for the prosecution of the war raised in four separate weeks of special War Loan campaigns was £26,368,879, exclusive of several millions invested by the Corporation and local companies individuals and trade unions through the banks and post-office.

Birmingham was the first city to put into operation a comprehensive food-rationing scheme, and this scheme afterwards became the basis of the plan adopted by the Government for the whole country.

At the university buildings at Edgbaston, which were the headquarters of the 1st Southern General Hospital, 1,358 beds were provided and at the branch hospitals further accommodation was provided until there was a total of 6,168 beds. In addition to the 64,000 wounded men treated at the university 20,000 patients were received at the Poor Law infirmary in Dudley Rd., 8,000 in elementary schools at Stirchley and King's Heath, 5,000 at the Monyhull Colony belonging to the board of guardians and at A.D. and civilian hospitals 5,000, making a total of over 100,000 military and naval patients. These huge figures did not include the record of the 1st and 2nd Birmingham War Hospitals, which were established under an arrangement with the asylums committee of the Corporation. At the Rubery and Hollymoor Mental Hospitals 36,795 wounded men, mostly orthopaedic cases, requiring special treatment, were nursed back to health.

The fact that Birmingham was one of the most important munition-making centres in England being well known to the Germans, they naturally made efforts to bomb the city from the air. For some time they were unsuccessful, owing to the severe lighting restrictions enforced by the chief constable in conjunction with the Home Office. Zeppelins, which caused serious destruction and loss of life in the Black Country on Jan. 31 1916, passed over the city without doing any damage. In consequence of representations made to the Government by the Lord Mayor of Birmingham on behalf of the municipalities of the Midlands, more effective means were taken to warn the inhabitants of impending air raids, and the anti-aircraft defences were also considerably improved before the next Zeppelin raid, which took place on Oct. 19 1917. On this occasion bombs were dropped on the Austin works at Longbridge, near the city boundary, but little damage was done. The third and final air attack on Birmingham took place on April 12 1918, when five Zeppelins set out to bomb the industrial towns of the Midlands. L.60 made direct for Birmingham, but timely warning was received at the headquarters of the Birmingham anti-aircraft defence in Newhall St., and when the airship was passing over Coventry it was met by gunfire and searchlights. These caused the raider to drop bombs in the open country in order to lighten his ship. When passing over Hockley Heath, just outside the city boundary, at an altitude of about 5 m., L.60 became an illuminated target for at least one of the Birmingham anti-aircraft guns. When the second and third Birmingham guns came into action the enemy turned tail, dropped two bombs, the first on the Robin Hood golf course and the other near Manor Farm, Shirley, and made a rapid retreat over Lapworth.

In addition to the thousands of Birmingham women who worked on munitions, 15,000 migrated into the city during the war. The Birmingham women's war agricultural committee, the women's volunteer reserve and the various naval and military auxiliaries also found employment for hundreds of girls. Among the many voluntary organizations in which ladies played a leading part, special mention should be made of the lady mayoress's depot, from which 273,553 garments and other articles were sent to soldiers at the front and in hospital, and 130,162 parcels were sent to 1,531 prisoners of war, the depot being the regimental care committee for the Warwickshire regiment. The war hospitals supply branch of the depot, which was established in March 1916, supplied 827,176 surgical requisites to the war hospitals. The war refugees committee and the citizens' committee were also mainly composed of women, the latter organization being responsible for a remarkable network of agencies for the relief of all kinds of civilian distress arising from the war, and for meeting the needs of soldiers' families and men broken in the war. (E. S.)

BIRRELL, AUGUSTINE (1850–), English author and politician (*see* 3.089), continued to be Chief Secretary for Ireland till the Dublin rebellion of Easter 1916, over nine years in all—a tenure of exceptional length of this particular office. The cattle-driving agitation died down, and Irish politics, save for labour troubles, were comparatively quiet, till the two general elections of 1910 had once again made retention of office by the leaders of the Liberal party dependent on the Irish vote. A third Home Rule bill was now inevitable, and Mr. Birrell spent much of the autumn of 1911 in preparation for it, being cheered by the appreciation of him shown by his young Scottish fellow-countrymen in his election to the Lord Rectorship of Glasgow. The main conduct of the bill was, however, taken out of his hands in the sessions of 1912, 1913, and 1914 by Mr. Asquith, the Prime Minister; but he frequently wound up the debates, and was largely responsible for the treatment of details in committee. When resistance was organized in Ulster, when volunteers were enlisted and drilled in the province, and a provisional government constituted, he adopted the *laisser-faire* attitude which had throughout been the mark of his Irish administration; and he applied the same treatment to the Irish volunteers who were raised in reply in the Sinn Fein and Nationalist interest. In all the earlier discussions in Parliament, he made light of the Ulster difficulty, and was frequently betrayed into inappropriate flippancy. Talking of Ulster and religious bigotry, he said that he had his own views of ecclesiastics; he had been in close touch with cardinals and archbishops, and "commended them all to God." But towards the end of the debates, he adopted a worthier manner, and advocated a national solution, and settlement by consent. In a striking phrase in the debate on the address in 1914, he spoke of a new Ireland, not necessarily Home Rule or Nationalist, but "the renaissance of a nation." When the World War broke out the controversy about Ulster was stilled as Home Rule was in abeyance, and in the Coalition Government of 1915 Mr. Birrell had Sir Edward Carson as a colleague, and would have had Mr. Redmond also had Mr. Redmond consented to accept Mr. Asquith's invitation. The danger with which he had to cope now came not from Orangemen or constitutional Nationalists, but from extremists of the Sinn Fein, Irish-American and Irish Labour parties, of whom Casement and Larkin were the apparent leaders. They promoted a strong and largely successful propaganda against enlistment in Ireland, which he entirely failed to extinguish, and which culminated suddenly in open rebellion in Easter 1916 (*see* IRELAND, HISTORY). Immediately after the suppression of the rising Mr. Birrell resigned, rather plaintively explaining that he was aware that he had run grave and considerable risks in not tackling Sinn Fein, but that he had subordinated everything in order to maintain unbroken the front of Ireland towards the enemies of the Empire. His retirement from office was followed by retirement from Parliament in 1918. He resumed his literary work, and published in 1920 a life of his father-in-law, the poet Frederick Locker-Lampson. His wife died in 1915.

BISSOLATI-BERGAMASCHI, LEONIDA (1857–1920), Italian statesman, was born at Cremona Feb. 20 1857. The son of Demetrio Bergamaschi, he was adopted by, and took the name of, his stepfather, Prof. Bissolati, the philosopher. At an early age he became a Socialist through his genuine sympathy with the lot of the poor, and an active member of the Italian Socialist party from its foundation in 1892. He exercised considerable influence as a journalist, editing the weeklies *La Critica sociale* and *La Lotta di classe*, and then the daily official organ of the party, *L'Avanti*. In 1897 he entered Parliament as member for Pescarolo; he afterwards was elected for Budrio and then for the second division of Rome (1908), which he represented until his death. Although a firm believer in the Socialist doctrine, Bissolati became more and more dissatisfied with certain aspects of the policy of the party, notably with its anti-patriotic attitude at the time of the Libyan War. In 1911 the split came, and Bissolati, together with Bonomi and some other leading Socialists, seceded from the party and formed what was known as the Reformist Socialist group, which supported the Giolitti Cabinet in its African policy on its promise of democratic reforms. At the outbreak of the World War Bissolati did not hesitate, and from the first declared himself in favour of Italian intervention on the side of the Entente against German militarism, whereas the "official" Socialist party was frankly neutralist and pro-German. When Italy entered the war he joined the army as a sergeant of the Alpini and was wounded and decorated for valour. In June 1916 the Boselli national Cabinet was constituted and Bissolati accepted office as minister without portfolio,

acting as a kind of intermediary between the Cabinet and the army. After the Armistice he resigned (Dec. 1918) owing to disagreements with Sig. Orlando's Government over the Pact of London. He was opposed to the annexation by Italy of the Alto Adige because of its German population, and of North Dalmatia with its Slav majority; but he advocated the annexation of Fiume as a purely Italian town. His attitude on the Alto Adige and Dalmatian questions lost him the popularity he had hitherto enjoyed with the majority of the nation, and his speech at Milan on the League of Nations, in which he set forth these views, was unfavourably received. He came in for severe criticism for having, at a moment when Italy's representatives found their country's aspirations challenged at every turn by the Allies, to some extent given away the Italian case and provided opponents with arguments from the mouth of an Italian ex-minister. At the same time everyone recognized his sterling qualities of honesty and genuine patriotism; however much people might disagree with his views, there was no doubt that he was inspired solely by what he believed were his country's best interests and noblest traditions, and his death at Rome on May 6 1920 was deeply regretted by all, regardless of party divisions.

BITTER, KARL THEODORE FRANCIS (1867–1915), American sculptor (*see* 4.13), died in New York April 10 1915. In 1911 he finished a model designed for the Henry Hudson monument. He was director of sculpture at the San Francisco Exposition (1912–5), and at the time of his death was president of the National Sculpture Society.

BJERKNES, VILHELM (1862–), Norwegian physicist, son of Carl Anton Bjerknes, professor of mathematics in the university of Christiania, was born in 1862, and was educated at the university of Christiania. He became at a very early age assistant to, and collaborator with, his father, who had discovered by mathematical analysis the remarkable apparent actions at a distance between pulsating and oscillating bodies in a fluid, and their analogy with the electric and magnetic actions at a distance. Apparently no attempt had been made to demonstrate experimentally the theories arrived at by the older professor until his son, then a lad of about 17 or 18 years of age, turned his mathematical knowledge and remarkable mechanical genius to the devising of a series of instruments, by which all the well-known phenomena of electricity and magnetism were illustrated and reproduced, by spheres and discs and membranes, set into rhythmic vibration in a bath containing a viscous fluid such as syrup. These remarkable demonstrations formed the most important exhibit in the department of physics at the Exposition Internationale d'Électricité held in Paris in 1881, and aroused the greatest interest in the scientific world.

The younger Bjerknes studied electric waves (1890–1) in Bonn, Germany, in the laboratory of Hertz, where he succeeded in giving the explanation of the phenomenon called "multiple resonance," discovered by Sarasin and De la Rive. Continuing his experiments at the university of Christiania (1891–2), he proved experimentally the influence which the conductivity and the magnetic properties of the metallic conductors exert upon the electric oscillations, and measured the depth to which the electric oscillations penetrate in metals of different conductivity and magnetic permeability (the "skin effect"). Finally he furnished (1895) a complete theory of the phenomenon of electric resonance, involving a method of utilizing resonance experiments for the determination of the wave lengths, and especially of the damping (the logarithmic decrement) of the oscillations in the transmitter and the receiver of the electric oscillations. These methods from that time have been in continuous use, and have contributed much to the development of wireless telegraphy. His papers on electric oscillations were published in *Annalen der Physik* (1891–5). In 1895, after he had been appointed to the newly created professorship of mechanics and mathematical physics at the university of Stockholm, where he had been lecturer since 1893, he returned to hydrodynamic investigations, pursuing them in two different directions. In his *Vorlesungen über Hydrodynamische Fernkräfte nach C. A. Bjerknes Theorie* (1900–2) he gave the first complete mathematical and experimental exposition of the discoveries of his father, whose age and excessive self-criticism had prevented him from finishing his work himself; and in a later book, *Die Kraftfelder* (1909), he stated the same theory in a very much generalized form according to methods of his own. On the other hand, he developed in 1898 the general law for the formation of circulations and vortices in a frictionless fluid, and began to apply the general vortex theory to atmospheric and oceanic motions. This attack upon the meteorological problems from a hydrodynamical point of view was after 1906 supported by the Carnegie Institution of Washington, of which he became a Research Associate. Two introductory volumes, *Statics* and *Kinematics*, of a greater work, *Dynamic Meteorology and Hydrography*, were published in 1913 under the auspices of the Institution.

In 1907 he was called back to the university of Christiania, where a personal professorship of mechanics and mathematical physics was created for him. In 1912 he was called to the university of Leipzig to create there a new professorship of geophysics and to organize, according to his own plans, a Geophysical Institute for atmospheric investigations. There, in 1916, he started the publication *Synoptische Darstellung atmosphärischer Zustände über Europa:* but in 1917 he returned to Norway, where he was attached, as professor of geophysics, to the new Geophysic Institute in the city of Bergen. He was the originator there of an improved and more scientific weather service, afterwards controlled by his son and collaborator, Jakob Bjerknes (b. 1897), which occasioned a new view of cyclones and anticyclones as waves in a surface of discontinuity separating air of polar from air of more equatorial origin, and cutting the ground along a line which can be followed on the weather maps, now generally called "the polar front." In 1893 Bjerknes married Honoria Bonnevie, who in earlier years assisted him much in his scientific work.

BLACHE, VIDAL DE LA (1845–1918), French geographer, was born at Pézenas, Hérault, Jan. 22 1845. He was educated at the École Normale Supérieure in Paris, and entered upon the study of geography by way of that of history. The relations between geographical causes and historical effects were with him the subject of a life-study, the results of which are seen in one of his best-known works, the *Tableau Général de la Géographie de France* prefixed to Lavisse's *Histoire de France* (1903) and later republished separately; but he always refrained from pressing the theory of geographical "control" to an extreme. He joined the French school at Athens in 1867, and was thus enabled to travel extensively in Mediterranean lands. From 1872 to 1877 he was in charge, latterly as professor, of the department of history and geography at Nancy; from 1877 to 1898 he taught geography in the higher grades at the École Normale Supérieure, and from 1898 to 1909 he held the chair of geography in the Faculté des Lettres at Paris. He lectured widely, and among his publications is the monumental *Atlas Général: Histoire et Géographie*, first published in 1894; he founded in 1891 and edited until his death the periodical *Annales de Géographie*, and contributed constantly to its pages. He died at Tamaris-sur-mer (Var) on April 5 1918.

BLAKE, EDWARD (1833–1912), Irish-Canadian statesman (*see* 4.35), died at Toronto March 1 1912.

BLAKELOCK, RALPH ALBERT (1847–1919), American painter (*see* 4.38) died near Elizabethtown, N. Y., in the Adirondacks, Aug. 9 1919. Because of insanity he was kept under restraint during the last 18 years of his life. In 1913 he was made an associate of the National Academy of Design and in 1915 a full member. In 1916 the Toledo Art Museum paid $20,000 for his "Brook by Moonlight."

BLINDNESS (*see* 4.59).—In England legislators have been slow to recognize the claims of the blind. It is true that as far back as the reign of Elizabeth and onwards through the reigns of George III., William IV. and Victoria provision was made by way of maintenance or education, mostly through the Poor Law authorities, but this was totally inadequate. In 1889 the Report

of the Royal Commission on the Blind, the Deaf and the Dumb was published, and it would appear that the Elementary Education (Blind and Deaf Children) Act, 1893, was passed as a result. The Act made compulsory the education of blind children between the ages of 5 and 16, the responsibility falling upon the local Education authority for the district in which a blind child resides. The Education of Blind and Deaf-Mute Children (Scotland) Act was passed three years prior to the English Act. Powers in respect of the continuation of the education of the blind over the age of 16 are conferred on Education authorities under the Education Act, 1902, Part II., and the Education Act, 1918. The Post Office Act, 1908, provides that a warrant may fix special postal rates for embossed literature. Regulations making *ophthalmia neonatorum* notifiable came into force in 1914. In May 1914 Mr. (later Sir) Herbert Samuel, as president of the Local Government Board, appointed a "Departmental Committee on the Welfare of the Blind" to consider the condition of the blind in the United Kingdom and the means available for (*a*) their industrial or professional training, and (*b*) their assistance, and to make recommendations. This committee's report was issued in July 1917. As a result a special department dealing with the welfare of the blind was set up in the Ministry of Health, and an advisory committee appointed.

In 1920 the Blind Persons Act came into operation in the British Isles. It secures to blind persons in indigent circumstances, on attaining the age of 50, "old-age" pensions of 10s. per week; it places the responsibility for the general care of the blind upon county and county borough councils and makes the registration of all charities for the blind compulsory. In Sept. 1920, the Ministry of Health appointed a committee to investigate and report on the causes of blindness, including defective vision sufficient to impair economic efficiency, and to suggest measures which might be taken for the prevention of blindness.

In the United States statutory provision for the blind may be divided into four divisions:—

(1) Laws affecting the education of the blind.
(2) The action to be taken by the State in the creation of special commissions to be concerned in their general welfare.
(3) Various forms of relief.
(4) All other relations of the law to the blind, most of these being of an indirect character.

In most civilized countries State provision for the blind exists in a more or less adequate degree.

Statistics.—Dr. Harry Best has estimated that the blind pop. of the world in 1920 numbered at least 2,390,000 persons, exclusive of those blinded in the World War of 1914–8, and he gives the following ratios per million of the pop. as far as ascertainable:—Canada 449, Mexico 782, Argentina 892, Chile 800, Austria 694, Belgium 435, Denmark 527, France 706, Germany 609, Hungary 895, Ireland 982, Italy 1,175, Netherlands 463, Norway 926, Russia (European) 2,016, Sweden 664, Switzerland 722, India 1,416, Egypt 13,251, Australia 705, New Zealand 478.

The blind pop. of England and Wales, as given by the Ministry of Health, July 1920, was 30,785, or 853 per million of the population.

Education.—The education of very young blind children has lately received closer attention in England by the establishment of kindergarten schools and classes—notably a model school at Birmingham, and the provision by the National Institute for the Blind of the first home in the British Empire for blind babies at Chorley Wood, Herts. This was to be followed by similar homes elsewhere. It is a fact that very few parents of blind children know how to treat them. Either they are spoiled by mistaken kindness or they are greatly neglected; in either case the result is thoroughly bad—hence the necessity of their removal to homes where they may live under the best conditions and may, in the hands of experts, receive a training suited to their disability. The percentage of blind children under the age of five who are mentally defective is very high, ranging from 33⅓% to 50%. They are unsuitable for schools for normal blind children, but are eligible for special schools for the blind—at St. Leonards-on-Sea at the age of three, and at Rhyl at the age of four.

A great impetus was given to the education of the blind in England by the founding of the College of Teachers of the Blind in July 1907. The objects of the college are primarily to promote and encourage the training of teachers of the blind, to improve their status and to afford them opportunities for submitting their qualifications to the scrutiny of an accredited examining body. The status, qualifications, training, remuneration and recruitment of craft teachers of the blind receive the careful attention of the college, the question of training being the most important. Great difficulty is experienced in securing good craftsmen who are well educated and apt at imparting their knowledge to their pupils. Until better facilities are available it is suggested that the ranks may best be filled by making careful selections from among the most expert craftsmen, and then imposing the art of teaching upon their craftsmanship. The office of the college is c/o National Inst. for the Blind, 224, Gt. Portland St., W. 1.

Employment.—As a large percentage of blind persons had lost their sight in adult life, professional and handicraft training is necessary even up to the age of 50, after which it is rarely successful. It is generally agreed that, where practicable, blind persons should continue in the occupations which they followed before losing their sight, but where, as is usually the case, this is not feasible a selection from the occupations most suited to the blind has to be made. The following is a list of trades and occupations practised by the blind, some being suitable for the workshop, some for the home and some for either: brush-making, basket-making, mat-making, mattress-making and allied industries, cane and rush seating, boot-repairing and clog-making, carpentry and wooden-toy making, ships' fender making, netting and string-bag making, hand and machine knitting, weaving, poultry-farming, dairy work, pig-rearing, gardening, fruit-farming, news-vending, shop-keeping.

Every encouragement should be given to the employment of suitable persons in professional work; blindness obviously inflicts a lesser handicap upon the brain worker than upon the manual worker, hence the desirability of encouraging intellectual pursuits, of which the following are the most usual: Holy orders, law, politics, music, lecturing, teaching, coaching, journalism, business management, commercial travelling, organizing and secretarial work, shorthand and typewriting, insurance and other agencies, telephony, massage, and pianoforte-tuning.

Excluding professional careers it is generally agreed that the workshop provides the best means of employing the blind, as they there obtain regular employment under skilled supervision and in many cases receive a substantial weekly bonus by way of augmentation of wages. Among the large workshops in the United Kingdom the following may be mentioned:—Bradford Royal Institution for the Blind; Birmingham Royal Institution for the Blind; Bristol Residential School and Workshops for the Blind; Cardiff Institute for the Blind; Leeds Incorporated Institution for the Blind and the Deaf and Dumb; Henshaw's Institution for the Blind, Manchester; Royal Midland Institution for the Blind, Nottingham; Liverpool Workshops and Home Teaching Society for the Outdoor Blind; Royal Blind Asylum and School, Edinburgh; Royal Glasgow Asylum for the Blind; Incorporated Association for Promoting the Welfare of the Blind, Tottenham Court Rd., London.

Systems of Reading.—The Braille system is used throughout the world, and can be adapted to any language or dialect. English-speaking countries use the British alphabet based on the original French alphabet devised by Louis Braille. In the United States some differences were introduced, but at the time of writing it seems most probable that a system almost identical with that common to all other English-speaking countries will rapidly come into vogue.

In addition to the Braille method of producing books for the blind the system invented by the late Dr. Moon is used to a considerable extent. It is easier to learn than Braille, but has the serious disadvantages of occupying very much more space, and of not lending itself to the contractions which have been introduced into Braille, and which greatly add to the speed of reading. The Moon Society is now controlled by the National Institution for the Blind.

Embossed Literature.—Great progress has been made in the methods of printing and illustrating books for the blind. In 1909 the National Institute for the Blind (then known as the British and Foreign Blind Association), through its secretary-general, Henry Stainsby, instituted exhaustive inquiries as to the best and quickest methods of printing Braille, with the result that the slow, cumbersome and unsatisfactory method of printing on wet paper gave place to the introduction of dry printing on special paper by means of fast-running electrically-driven and electrically-heated presses of the platen type. This new method of printing was found to be 15 times faster than the old method.

Book illustrations which are essentially diagrammatic rather than pictorial are printed on the same presses, the plates consisting of folded sheets of zinc upon which illustrations are embossed by means of a special machine and a variety of hand punches. The embossing through folded sheets of metal produces a perfect die and counter-die, between which the paper is embossed in the press.

The fact that many scientific books are produced in Braille must be laid to the credit of Mr. H. M. Taylor, Fellow of Trinity College, Cambridge, who invented the mathematical and chemical formulae which render their use possible. Blind students in all English-speaking countries owe much to Mr. Taylor for having enabled them to read by themselves books which otherwise they could only have mastered with the help of a reader.

Many magazines for the blind, designed to suit various classes of readers, are published in the United Kingdom, the principal being *Progress*, *The Literary Journal*, *The Braille Musical Magazine*, *Comrades*, *The School Magazine*, *Nuggets*, *Hampstead Magazine*, and *Hora Jucunda*. But the magazine which has the largest circula-

tion is the *Matilda Zeigler Magazine* published by W. C. Holmes, New York, and distributed free of charge. There are two weekly newspapers for the blind in the United Kingdom—the *Braille Mail* and *Weekly Summary*.

Music.—The Braille music notation has recently undergone great developments at the hands of a committee of blind experts appointed by the National Institute for the Blind, under the chairmanship of its director of music, H. C. Warrilow. The old method of writing several bars for the right hand followed by a corresponding number for the left hand has given place to the practice of writing only a bar for each hand alternately. In music of a simple character both hands are written together, chord by chord. These two modes of writing are known as the "bar by bar" and "vertical score" methods respectively, and emphasize the harmonic aspect as distinguished from the melodic which characterized the old method, the parts being always written upwards from the bass. So great has been the general improvement in representing the staff notation that it is now possible to record in Braille any kind of music, no matter how elaborate.

Lending Libraries.—Embossed books and music, being very cumbersome, can only be stored in limited numbers in the homes of the blind, but are admirably distributed free of charge by such agencies as the National Library for the Blind, London, which possesses 65,000 volumes (representing 7,500 complete works) of general literature in the Braille and Moon types, and 11,000 pieces of music (representing 5,000 complete works).

Apparatus.—Various methods have been devised to supply the blind with reading-matter other than through the ordinary channels of embossed books, but none of these have so far proved very practical, though hopes are entertained that continued and patient investigation will solve many of the difficulties that now prevent their wide adoption.

Institutions and Societies for the Blind.—The accommodation provided for schools and workshops has been greatly improved in England either by additions to existing buildings or the erection of entirely new premises. Within the latter category may be mentioned the schools for the blind at Gorleston-on-Sea, Leatherhead, Bristol, Bradford, and the workshops at Birmingham and Hull. The extensive new buildings of the headquarters of the National Institute for the Blind were opened by the King and Queen in March 1914. This Institute has, since then, made enormous strides, its principal work being the publication of books and music, home teaching, provision of homes and hostels for the blind, care of blind babies, the relief and after-care of blind civilians, and the higher education of the blind and the financing of other societies. It is affiliated to St. Dunstan's and to the Canadian National Institute for the Blind, the last-named doing corresponding work from its headquarters in Toronto.

Obituary.—Among notable blind men who have died since 1910 may be mentioned the following:—

Sir Francis Joseph Campbell, LL.D. (1832–1914), the writer of the earlier article in this encyclopaedia (*see* 4.59*). Born in Franklin county, Tennessee. Blinded at the age of four by the thorn of an acacia tree whilst playing. Educated at various schools for the blind, also at Harvard, Leipzig and Berlin. Was first principal and co-founder with Dr. T. R. Armitage of the Royal Normal College for the Blind, Upper Norwood, London, through which great impetus was given to the higher education of the blind, particularly in fitting sightless persons to become teachers, musicians, pianoforte-tuners, and correspondence clerks.

The Rev. H. J. R. Marston, M.A. (1853–1921). Rector of Lydford-on-Fosse. Graduated at Durham University, where he had a brilliant career, obtaining high honours and the Hellenistic Greek prize,—also a fellowship.

John Brown Herreschoff (1841–1915). The famous blind designer of the "Vigilant," "Defender" and "Columbia," which so successfully defended the American Cup against the "Valkyries" of Lord Dunraven and Sir Thomas Lipton's "Shamrocks."

The Rev. William Hill-Murray (1841–1911). As an agent of the National Bible Society of Scotland he was sent to China and there became interested in the cause of the blind, and himself invented a numeral system for the blind to take the place of the intricate Chinese language.

Bibliography.—Sir Arthur Pearson, *Victory over Blindness* (1919) and *The Conquest of Blindness* (1921); W. H. Illingworth, *The History of the Education of the Blind* (1910); Winifred Holt, *A Beacon for the Blind, being the Life of Henry Fawcett* (1915); Harry Best, *The Blind* (1919); Wm. Campbell Posey, *Hygiene of the Eye* (1920).

Blinded Soldiers and Sailors.—Special reference must be made to the British soldiers and sailors who were blinded in the World War, and who came directly under the care of the St. Dunstan's organization, which it was the writer's privilege to found and conduct. These men form an exceptional group in the blind world, but the success of the ideas adopted in their training, the high example of the men themselves, and the interest awakened by their triumph over difficulties, must have a permanent influence in raising the status of the blind even in other countries beyond the United Kingdom. The men were exceptional, because so many of them were young and full of the vigour of health when their sight was taken from them. Drawn from all classes, differing greatly in education, experience and temperament, they were as a whole men with a keen hold on life, ready for any effort that would bring them again in touch with the everyday world of work and pleasure. Fundamental to their training was the idea that blindness was not to be regarded as setting men apart from their fellows. It was to be held in the light of a handicap; never as an affliction calling for pity. They were to rely on themselves to the utmost degree and to make it their object to be normal. In itself such a mental outlook had a far-reaching influence; on it was based the whole system of training for these blinded soldiers who, from the first, found themselves kept in touch with all ordinary interests, while the kind of work for which their training fitted them went far beyond old-fashioned ideas of occupations for the blind.

St. Dunstan's, a large house with 15 ac. of ground, bordering on Regent's Park, London, was generously placed at the disposal of the Blinded Soldiers' and Sailors' Care Committee by Mr. and Mrs. Otto Kahn, and was opened in March 1915. It became the officially recognized training centre for the British fighting men (including those of the overseas forces) who lost their sight in the war, with the exception of a comparatively small number of the Scottish soldiers who were trained at Newington House, Edinburgh. Queen Alexandra graciously consented to be patroness of the hostel. Other large houses in the neighbourhood were lent or rented; temporary buildings—including dormitories, classrooms, workshops, two chapels and recreation halls—were erected in the grounds of St. Dunstan's. On account of the difficulty of getting in touch with the blinded soldiers scattered in many hospitals the military authorities arranged for their treatment at St. Mark's, Chelsea, the 2nd London General Hospital. In this way was avoided the danger of discharged men returning hopelessly to their homes with no other prospect than lives of vacuity. While still in the wards of the hospital they learned what blind men were able to accomplish, and began, under the tuition of visitors from St. Dunstan's, the task that lay before them of conquering blindness, a task in which few of the whole number were to fail. Nor was it to occupy any great length of time. The course of reëducation, all that is involved in learning to be blind, occupied in some cases less than a year and seldom extended to two years. Many of the men were not only blind but had been otherwise wounded; some had lost a hand, or an arm or a leg, or were sufferers from shell-shock. But even in spite of these additional difficulties rapid progress was usually made.

The accepted definition of blindness was: "Unable to read or write or to do ordinary work in any ordinary way." The vast majority of the men who came to St. Dunstan's had had their eyes destroyed or were what is known as "dark blind." The remainder were able to distinguish light, and of these a small number had some slight degree of sight. Such were the men who with almost unexampled fortitude set themselves to get back to active life.

It is well to emphasize the spirit of St. Dunstan's. The hostel was a centre of brightness, and the men were no less determined to be happy than the people about them were to help them to forget what they could not do and to make the most of all that they could do. At one time no fewer than 800 men and women were giving the whole or some part of their time to the care, entertainment and instruction of the blinded soldiers. Through the carpets in the public rooms of St. Dunstan's ran linoleum paths for the blinded men, handrails bordered the walks through the grounds, sounding-boards gave warning of steps. With these helps the men quickly developed the senses of direction and obstacle, the confidence that would enable them to find their way in their own homes without assistance and to trust themselves in public thoroughfares. Self-reliance was a constant aim; the blinded soldier learned the value of avoiding whatever might emphasize his handicap. The more normal his bearing the more were those about him put at their ease, and from every point of view was his happiness increased. In the sense of touch, of hearing and of smell he daily discovered new powers. From the impressions thus received he began to visualize, forming mental pictures of the people he met and his surroundings. The men at St. Dunstan's had not only to learn to work but to discover how

* *These figures indicate the volume and page number of the previous article.*

fully their leisure hours might be occupied. Constant entertainments were given at the hostel; the men were taken to concerts and theatres; they attended football and cricket matches, with escorts to describe the games; they found much pleasure in dancing, and threw themselves into the interest of out-door sports, swimming, foot races, tugs-of-war and rowing. The St. Dunstan's crews practised on Regent's Park lake, under the direction of a coach, and annually competed against one another in regattas on the Thames; they raced, also, against sighted crews with success.

The hours devoted to instruction at St. Dunstan's were short; in teaching the newly blind it is necessary to remember the effort of intense concentration involved. Two-and-a-half hours in the morning and two hours in the afternoon were spent by the men in the classrooms and workshops. The employment of many blind instructors was an important factor in the rapid progress that was made; the blind experts gained at once the confidence of the blinded soldiers, who realized that their difficulties were understood and that nothing beyond their powers was being demanded. Among the officers and men were many already experienced in some branch of business or professional work, and when it was feasible they were encouraged to prepare themselves to resume their accustomed employment. The fact that one of the blinded officers went back to his practice as a barrister, and another renewed his work as a chartered accountant, may be recorded as examples of the manner in which difficulties were surmounted. The occupations selected as being most easily mastered by the sightless man who seeks profitable employment were eight: massage, poultry-farming, shorthand-writing (by means of a machine), telephone-operating, joinery, boot-repairing, mat-making and basketry. All of these were taught, in addition to the art of netting, which may be regarded as a remunerative form of recreation for the blind. Many of the blinded soldiers learnt two trades. All of them acquired proficiency in typewriting and received instruction in reading and writing Braille.

While the war was still in progress some 60 blinded soldiers were already employed, largely in military hospitals, as trained masseurs. They had passed stiff examinations, and it is a remarkable fact that, in spite of their own disability, they had equipped themselves to help in the cure of other wounded men. As soon as the blinded soldiers had mastered an occupation they were found employment or set up in their new industry. Apart from the pensions they received they were able to earn incomes in some cases higher than they had gained as sighted men before joining the army.

Before the close of 1920 1,300 blinded soldiers were established in different occupations in Great Britain, in Canada, South Africa, Australia and New Zealand. At that time there were still several hundred others in training or to be trained. Besides the soldiers actually blinded in the war, 23,000 were discharged from the army with seriously damaged eyesight, and from this number men arrived at St. Dunstan's overcome by the blindness which had for long threatened them.

Early in 1921 St. John's Lodge, on the Inner Circle of Regent's Park, became the permanent headquarters of St. Dunstan's work.

The generosity of the public who supported St. Dunstan's was a tribute to the high courage of the blinded soldiers; it made it possible to do everything that was required for their new start in life and to create an organization for their after-care. A high percentage of success cannot be attained in the rehabilitation of any large body of blind men by training alone. Some definite assistance is required after men have been trained, supplied with their tools and equipment and settled in their own homes. A scheme of organized assistance was first tried on a large scale by the authorities of St. Dunstan's. The first concern of the blind craftsman is his supply of raw material. This must be constant, of the right quality and nature, and must be available at a good market price. Lack of sight makes the ensuring of these essentials difficult, and St. Dunstan's organization therefore established a stores and materials department from which any blinded soldier was able to obtain in small quantities the materials necessary for his trade. Many hundreds of articles or kinds of material coming from all parts of the world were always kept in stock. All goods were supplied strictly at average cost, all expenses of buying, storing and distributing being met from St. Dunstan's funds. In order to ensure a constant market, even in times of trade depression, sales depots were established, and the men were paid by return of post the average price obtained when their goods were sold. All expenses connected with carriage and achieving the sales were paid by the organization. All articles which were sent up for sale were critically examined, and any tendency to bad or careless workmanship was quickly stopped. A staff of experts was employed to visit the men periodically in their homes where they were able to correct mistakes and teach new types of work in local demand. An employment and propaganda department was established to obtain work for, and promote the interest of, professional men, and steps were taken to ensure that their methods of working were modern and up-to-date. In addition to the administration of the services mentioned above, a number of convalescent and holiday annexes were established throughout the country. A fund was available from which men could obtain grants in cases of sickness, accident or business difficulty. The Blinded Soldiers' Children Fund, which was raised to provide a weekly allowance until the age of 16 years to every child born to a blinded soldier after his disablement, and therefore not pensioned by the Government, was distributed by this department. The men's typewriters were kept in working order, the visitors who went to see the men at intervals being given a short course of instruction in minor repairs. Music, reading and games were encouraged among the men, and books, magazines, cards, dominoes, and music were provided when these were required. In general, St. Dunstan's After-Care Organization aimed at reducing a blind man's handicap to a minimum in order to enable him to compete with his sighted rivals on even terms.

In the preparation of this article the author gratefully acknowledges the assistance of Mr. Henry Stainsby, the secretary-general of the National Institute for the Blind, and of Capt. Ian Fraser, director of the After-Care Organization of St. Dunstan's. (A. P.)

BLISS, CORNELIUS NEWTON (1833–1911), American merchant and politician (*see* 4.72), died in New York Oct. 9 1911. Although prominent in the Republican party and long the treasurer of its national committee, he would never run for public office. His lack of sympathy with Theodore Roosevelt's growing influence led him to retire from active politics.

BLISS, TASKER HOWARD (1853–), American soldier, was born at Lewisburg, Pa., Dec. 31 1853. He graduated from West Point in 1875, was commissioned second lieutenant, and in 1880 was promoted to first lieutenant. From 1885 to 1888 he was professor of military science at the Naval War College; then for seven years aide-de-camp to Gen. Schofield and inspector of rifle practice, with the rank of captain from 1892. In 1897 he became military attaché at the American legation in Madrid. In 1898 he became major, and on the outbreak of the Spanish-American War was promoted lieutenant-colonel, serving through the Porto Rican campaign. From 1898 to 1902 he was in charge of Cuban customs and collector for the port of Havana. In 1902 he became a member of the Army War College Board, and in the following year commandant of the Army War College. From 1903 to 1905 he was a member of the joint Army and Navy Board and also a member of the general staff. From 1905 to 1909 he held various commands in the Philippines. During the latter half of 1909 he was president of the Army War College and a member of the general staff, and then was appointed assistant chief-of-staff, becoming in 1915 chief-of-staff. In 1917 he was made commanding-general, U.S. army, but later in the year retired, having reached the age limit. He was a member of the Allied Conference (1917), of the Supreme War Council (1918), and of the International Peace Conference (1918–9).

BLOCKADE (*see* 4.72).—The blockade enforced against Germany by the Allies in the World War was both in form and extent without precedent in naval history, and its enforcement has given a new meaning to the word. It was not a blockade in the strict sense of the word; that is, a cordon of ships off an enemy's coast precluding all approach to it under ban of confiscation. In its final form it constituted a vast system of economic pressure for the restriction of enemy supplies, and the power of the British navy to intercept, detain and search ships and cargoes afloat remained up to 1917 an essential part of it.

The Declaration of London, under which the navy attempted at first to enforce the blockade, proved mere filigree, entirely inapplicable to the intricacies of naval war. It represented an attempt to reduce prize law to a code, and its effect was to render

the British blockade of Germany futile up to March 1915. Under its rules food, cotton and all conditional contraband could not be touched so long as they were discharging at neutral ports such as Rotterdam or Copenhagen. One saving clause had been added in an Order of Council of Aug. 20 1914, which permitted some latitude by rendering such cargoes liable to capture if there were sufficient evidence of enemy destination. Unfortunately even this safeguard was swept away by a British Order in Council of Oct. 29 1914 which restricted seizure of conditional contraband to goods consigned to "order" or without a named consignee, a regulation which promptly produced a vast crop of dummy neutral consignees and rendered the blockade ineffective for five months. No further action was taken against food-stuffs, and for five months a succession of ships streamed daily through the Downs, bound for Holland and Scandinavia with food and cotton for Germany. Four cargoes only were placed in prize, whereupon the prize court in London proceeded to sweep all the veneer of rules away and adjudged that a "named consignee" must be a *bona fide* and not a dummy consignee (British and Colonial Prize Cases, the "Rijn," June 6 1917).

The judgment has an important general bearing, for it constitutes a justification from the naval point of view of the established system of adjudication by a qualified court, where general principles are applied to particular cases in the light of experience and common sense, compared with a system based on a code operated by busy officials under a burdened Secretary of State.

It was not until March 11 1915 that the blockade was tightened up by a new British Order in Council, under which all goods with enemy destination or of enemy origin became liable to seizure, and it was not till July 7 1916 that the broken shards of the discredited Declaration of London were finally swept out of the way. It was not a code but machinery that was wanted, and by March 1915 the machinery was beginning to take shape. The part played by the British navy consisted in the interception and examination of ships, which was under the purview of the Trade Division (Capt. Richard Webb) of the Admiralty. A British Contraband Committee, with representatives of the Admiralty (Capt. Horace Longden and Lt.-Comm. W. E. A. Arnold-Forster), Foreign Office and Board of Trade, had been set up in 1914 to decide whether a ship or cargo was to be sent in for adjudication. Its necessary adjunct, a War Trade Intelligence Department to collect and collate information of ships and cargo, was established somewhat later. The code disappeared, and each cargo was dealt with on its merits.

The British naval work directly associated with the blockade fell under two heads—the work of the blockade squadrons at sea and the service of naval control. It was the function of the blockade squadrons to patrol the avenues to the ocean, intercept neutral craft and send them into port for examination. This was the task of the 10th Cruiser Squadron, one of the hardest tasks of the war and one which has received perhaps too scanty a meed of praise. The squadron consisted at first of Edgar class cruisers, but being unable to stand the terrific seas of the North Atlantic they were withdrawn and their place taken by large armed merchant cruisers (18 in number, in Nov. 1914) under the command of Rear-Adml. Dudley de Chair (succeeded in 1916 by Vice-Adml. Sir Reginald Tupper). In the South the conditions were different. The configuration of the coast, the fear of minefields and destroyer patrols off Dover resulted in all traffic being shepherded willy-nilly into the Downs; and this practically dispensed with the difficult task of interception. The practice of performing the search of ships in harbour was an innovation, and it remains one of the outstanding lessons of the war that "visit and search" (if the search involves an effective examination of the cargo) cannot be effectively performed at sea, partly on account of the complexity and difficulty of the work under modern conditions, partly on account of the danger of submarine attack. Ships were accordingly sent into harbour to be searched, and though the dispatch of neutral ships into harbour was undoubtedly a considerable extension of the universally recognized right of visit and search, it was an extension inherent in the circumstances, for without it the search would have become ineffective and the right null and void. The practice, however, involved some nice legal points, such, for instance, as whether a ship sent into a harbour by *force majeure* to be subjected to visit and search comes under the full force of municipal jurisdiction and of port regulations which would have subjected a huge Norwegian liner to quarantine for a case of smallpox on board.

The patrol lines of the 10th Cruiser Squadron stretched at first from Norway to the Shetlands (250 m.), but as the submarine menace extended they were moved to the westward and lay sometimes between Iceland and the Hebrides, sometimes between the Shetlands and Faroes (160 m.), and the Faroes to Iceland (160 m.). The average weekly number of ships intercepted in 1915 was about 66, of which some 15 to 20 were sent weekly into Kirkwall with an armed guard. It was the duty of the officer of the armed guard merely to ensure that the ship was steering a proper course, and he did not interfere in any way with the ordinary navigation or administration of the ship.

Little has been written of the work of the 10th C. S., but its dangerous nature can be gathered from the number of its ships lost by mine and submarine. In 1915 its losses amounted to four. The "Viknor" (Comm. E. O. Ballantyne) was lost with all hands, off the coast of Ireland (Jan. 13), probably on a mine; the "Clan Macnaughton" was supposed to have foundered (Feb. 3); the "Bayano" was sunk by U27 on March 11 off Galloway; the "India" by U22 off the coast of Norway on Aug. 20. The "Alcantara" (Capt. Thos. E. Wardle), which sank the raider "Greif" on Feb. 29 1916, belonged too to this squadron, whose name was a household word in the blockade. The institution of the white-list and black-list, which gave an indication of a ship's nature, and the issue of green clearances to neutral ships sailing from British ports, facilitated the work of interception; and by March 1915 nearly all the more important neutral lines had agreed to call at Kirkwall or the Downs in order to avoid the delay of being intercepted far out at sea and losing time in putting back.

In 1915 the number of vessels intercepted by the 10th C. S. was 3,098, of which 743, or 24%, were sent into Kirkwall; the remainder, including 817 fishing vessels and 408 British and Allied ships, were allowed to pass. During the same year 19 ships succeeded in evading the patrols, of which only eight were of real consequence, a comparatively small number in view of the long northern nights full of wind and frost and snow.

The port of control and detention in the North was Kirkwall, which provided a large enclosed harbour where ships could be safe from the sea and the enemy. The average number of ships calling and sent in was some two or three a day in 1915, but in the latter part of 1916, when Dutch traffic began to go north for a time, it rose to five or six.

The Downs (Comm. W. Moorsom and Capt. Walter Tomlin) was far the largest control station, and had the really immense task of dealing with three-quarters of the neutral trade of northern Europe. All the Channel traffic up and down had to be shepherded through, and here some 10 to 15 neutral ships had to be examined daily. The manifest was taken off, sent ashore, summarized (no light task in the case of big Dutch East Indies cargo ships) and telegraphed to the Contraband Committee. The ship outside the hold was searched for contraband and German mail-bags, and some of the items in the hold were examined and compared with the manifest. To examine and search a large liner and the luggage of some 500 passengers took 10 officers and 20 picked men the best part of 18 hours. German women were searched by lady searchers and allowed to go on. Meanwhile the manifest was examined by the Contraband Committee in the light of the knowledge they had of ships, cargoes, consignors and consignees, and instructions sent to clear the ship or to send her in to discharge all or a portion of her cargo, or to detain her till guarantees were received. The ordinary period of detention for ships eastward bound was one to three days, for ships westward bound a day or less. A smaller control station at Falmouth relieved the Downs of a portion of its burden.

The power of naval interception, visit and search, was in itself a powerful form of pressure, for neutral shipping companies in

fully their leisure hours might be occupied. Constant entertainments were given at the hostel; the men were taken to concerts and theatres; they attended football and cricket matches, with escorts to describe the games; they found much pleasure in dancing, and threw themselves into the interest of out-door sports, swimming, foot races, tugs-of-war and rowing. The St. Dunstan's crews practised on Regent's Park lake, under the direction of a coach, and annually competed against one another in regattas on the Thames; they raced, also, against sighted crews with success.

The hours devoted to instruction at St. Dunstan's were short; in teaching the newly blind it is necessary to remember the effort of intense concentration involved. Two-and-a-half hours in the morning and two hours in the afternoon were spent by the men in the classrooms and workshops. The employment of many blind instructors was an important factor in the rapid progress that was made; the blind experts gained at once the confidence of the blinded soldiers, who realized that their difficulties were understood and that nothing beyond their powers was being demanded. Among the officers and men were many already experienced in some branch of business or professional work, and when it was feasible they were encouraged to prepare themselves to resume their accustomed employment. The fact that one of the blinded officers went back to his practice as a barrister, and another renewed his work as a chartered accountant, may be recorded as examples of the manner in which difficulties were surmounted. The occupations selected as being most easily mastered by the sightless man who seeks profitable employment were eight: massage, poultry-farming, shorthand-writing (by means of a machine), telephone-operating, joinery, boot-repairing, mat-making and basketry. All of these were taught, in addition to the art of netting, which may be regarded as a remunerative form of recreation for the blind. Many of the blinded soldiers learnt two trades. All of them acquired proficiency in typewriting and received instruction in reading and writing Braille.

While the war was still in progress some 60 blinded soldiers were already employed, largely in military hospitals, as trained masseurs. They had passed stiff examinations, and it is a remarkable fact that, in spite of their own disability, they had equipped themselves to help in the cure of other wounded men. As soon as the blinded soldiers had mastered an occupation they were found employment or set up in their new industry. Apart from the pensions they received they were able to earn incomes in some cases higher than they had gained as sighted men before joining the army.

Before the close of 1920 1,300 blinded soldiers were established in different occupations in Great Britain, in Canada, South Africa, Australia and New Zealand. At that time there were still several hundred others in training or to be trained. Besides the soldiers actually blinded in the war, 23,000 were discharged from the army with seriously damaged eyesight, and from this number men arrived at St. Dunstan's overcome by the blindness which had for long threatened them.

Early in 1921 St. John's Lodge, on the Inner Circle of Regent's Park, became the permanent headquarters of St. Dunstan's work.

The generosity of the public who supported St. Dunstan's was a tribute to the high courage of the blinded soldiers; it made it possible to do everything that was required for their new start in life and to create an organization for their after-care. A high percentage of success cannot be attained in the rehabilitation of any large body of blind men by training alone. Some definite assistance is required after men have been trained, supplied with their tools and equipment and settled in their own homes. A scheme of organized assistance was first tried on a large scale by the authorities of St. Dunstan's. The first concern of the blind craftsman is his supply of raw material. This must be constant, of the right quality and nature, and must be available at a good market price. Lack of sight makes the ensuring of these essentials difficult, and St. Dunstan's organization therefore established a stores and materials department from which any blinded soldier was able to obtain in small quantities the materials necessary for his trade. Many hundreds of articles or kinds of material coming from all parts of the world were always kept in stock. All goods were supplied strictly at average cost, all expenses of buying, storing and distributing being met from St. Dunstan's funds. In order to ensure a constant market, even in times of trade depression, sales depots were established, and the men were paid by return of post the average price obtained when their goods were sold. All expenses connected with carriage and achieving the sales were paid by the organization. All articles which were sent up for sale were critically examined, and any tendency to bad or careless workmanship was quickly stopped. In general, St. Dunstan's After-Care Organization aimed at reducing a blind man's handicap to a minimum in order to enable him to compete with his sighted rivals on even terms.

In the preparation of this article the author gratefully acknowledges the assistance of Mr. Henry Stainsby, the secretary-general of the National Institute for the Blind, and of Capt. Ian Fraser, director of the After-Care Organization of St. Dunstan's. (A. P.)

BLISS, CORNELIUS NEWTON (1833–1911), American merchant and politician (*see* 4.72), died in New York Oct. 9 1911. Although prominent in the Republican party and long the treasurer of its national committee, he would never run for public office. His lack of sympathy with Theodore Roosevelt's growing influence led him to retire from active politics.

BLISS, TASKER HOWARD (1853–), American soldier, was born at Lewisburg, Pa., Dec. 31 1853. He graduated from West Point in 1875, was commissioned second lieutenant, and in 1880 was promoted to first lieutenant. From 1885 to 1888 he was professor of military science at the Naval War College; then for seven years aide-de-camp to Gen. Schofield and inspector of rifle practice, with the rank of captain from 1892. In 1897 he became military attaché at the American legation in Madrid. In 1898 he became major, and on the outbreak of the Spanish-American War was promoted lieutenant-colonel, serving through the Porto Rican campaign. From 1898 to 1902 he was in charge of Cuban customs and collector for the port of Havana. In 1902 he became a member of the Army War College Board, and in the following year commandant of the Army War College. From 1903 to 1905 he was a member of the joint Army and Navy Board and also a member of the general staff. From 1905 to 1909 he held various commands in the Philippines. During the latter half of 1909 he was president of the Army War College and a member of the general staff, and then was appointed assistant chief-of-staff, becoming in 1915 chief-of-staff. In 1917 he was made commanding-general, U.S. army, but later in the year retired, having reached the age limit. He was a member of the Allied Conference (1917), of the Supreme War Council (1918), and of the International Peace Conference (1918–9).

BLOCKADE (*see* 4.72).—The blockade enforced against Germany by the Allies in the World War was both in form and extent without precedent in naval history, and its enforcement has given a new meaning to the word. It was not a blockade in the strict sense of the word; that is, a cordon of ships off an enemy's coast precluding all approach to it under ban of confiscation. In its final form it constituted a vast system of economic pressure for the restriction of enemy supplies, and the power of the British navy to intercept, detain and search ships and cargoes afloat remained up to 1917 an essential part of it.

The Declaration of London, under which the navy attempted at first to enforce the blockade, proved mere filigree, entirely inapplicable to the intricacies of naval war. It represented an attempt to reduce prize law to a code, and its effect was to render

alterations to existing houses at Brocklesby Park, Lincs.; Apethorpe, Northants.; Chequers Court, Bucks. and elsewhere. Amongst his London work are the United University Club, Pall Mall; the Goldsmiths' College, New Cross; the London and County Bank; the Imperial War Cross, Chelsea; and Paul's Cross, St. Paul's Churchyard. At Oxford he built the new buildings for Lady Margaret Hall, and at Bath the Holbourne Museum. With Sir Aston Webb and Ernest Newton he was appointed to advise as to the architectural treatment of the Quadrant, Regent Street, London, and he designed a portion of the façade.

As author, Sir R. Blomfield is known by various important volumes of history and criticism. His Academy School Lectures were published in 1908 as *The Mistress Art.* His *Formal Garden in England* (1892), published in collaboration with F. Inigo Thomas, did much to make known the claim of the architect to consider as his right not only the design of the building but of the surroundings in which it was set. His *History of Renaissance Architecture in England* (1897) and his successive works on *French Architecture* (1911 and 1921) are accepted by students as textbooks, and their illustrations show the author's considerable powers as a black-and-white artist.

Sir R. Blomfield was elected A.R.A. in 1905, and R.A. in 1914, in which latter year he was also made Officier de l'Instruction publique by the French Government. He was professor of architecture at the Royal Academy from 1906 to 1910. He was elected president of the R.I.B.A. in 1914, and received its Gold Medal in 1913.

As an old member of the Inns of Court volunteers, at the commencement of the World War he received a commission as officer in charge of trench work. At its termination he was appointed a principal architect of the Imperial War Graves Commission, and he was one of the chief designers of various forms of local war memorial. In 1906 he was made hon. fellow of his college, and in 1920 Liverpool University conferred on him the hon. degree of Litt.D. He was knighted in 1919 in recognition of his work as architect and author.

BLUE SKY LAWS.—This name is popularly applied in the United States to those statutes enacted in many states to protect from fraud purchasers of stocks and bonds. The first Blue Sky law was passed in Kansas in 1911, requiring investment companies among other things to file with the Secretary of State a full description of their business and forbidding them to sell securities until authorized by the bank commissioner. Following the Kansas model, within two years no fewer than 18 other states had enacted similar legislation, and by the close of 1919 some form of Blue Sky law was to be found in 44 states. Requirements vary in the different states, but in every case information must be filed with a designated official or commission and licence obtained. In 1914 there developed considerable opposition to such legislation. Its constitutionality was attacked on the ground that it violated the commerce clause of the Federal Constitution; that it delegated legislative and judicial power to an executive official; that it deprived citizens of liberty and property without due process of law. In three states, Michigan, Iowa and Ohio, these contentions were upheld by the lower courts; but in 1917 the U.S. Supreme Court decided that such laws were constitutional on the ground that "prevention of deception is within the competency of government."

BLUNT, WILFRID SCAWEN (1840–), English writer (*see* 4.93), published a complete edition of his poetical works in 1914 and two volumes of *My Diaries* (1919 and 1920). His wife, Lady Anne Blunt, became Baroness Wentworth on the death of her niece, the daughter of the 13th Baron and 2nd Earl of Lovelace, in 1917. She completed a *History of the Arabian Horse* just before her death in Egypt Dec. 25 1917. She was succeeded in the title by her daughter Judith Anne Dorothea, wife of Neville Stephen Lytton (b. 1879), 4th son of the 1st Earl of Lytton.

BODINGTON, SIR NATHAN (1848–1911), vice-chancellor of Leeds University, was born at Aston May 29 1848. A graduate of Wadham College, Oxford, he became a fellow of Oriel, and in 1882 professor of Greek and principal of Yorkshire College, Leeds. It was owing to his efforts that the college was endowed and chartered in 1903 as a university. He died at Leeds May 12 1911.

BOEHM VON BAWERK, EUGEN (1851–1914), Austrian economist and statesman (*see* 4.112), died in 1914.

BÖHM-ERMOLLI, EDUARD, Freiherr von (1856–), Austro-Hungarian field-marshal, was born in 1856 at Ancona, then an Austrian garrison town. He entered the army, serving in the cavalry and on the general staff. In the World War he commanded the 2nd Army, fighting first in Serbia, then against the Russians in Galicia and Poland. In the operation of the pursuit of the enemy after the battle of Gorlice he captured the Galician capital, Lemberg, on June 22 1915. He also played a distinguished part in the summer offensive of 1917. After the conclusion of the peace of Brest-Litovsk he marched into the Ukraine, and directed from Odessa the measures for turning to account the resources of that country. In numerous battles Böhm-Ermolli showed his capacity as a general in the field, and was highly appreciated by the Germans.

BOISBAUDRAN, PAUL EMILE FRANÇOIS LECOQ DE (1838–1912), French chemist, was born at Cognac in 1838. He was the discoverer of gallium in 1875 and a student of spectroscopics generally, on which he wrote several treatises. Some details as to his work appear in 5.761; 6.46; 8.208; 11.421, 777. He died in Paris May 31 1912.

BOITO, ARRIGO (1842–1918), Italian poet (*see* 4.155), died June 10 1918.

BOLDREWOOD, ROLF, the pen name of Thomas Alexander Browne (1826–1915), Anglo-Australian novelist, was born in London Aug. 6 1826 and was educated at Sydney College, N.S.W. He had an adventurous early life in Australia, being successively a sheep farmer, a pioneer squatter in Victoria and police magistrate and warden of goldfields till 1895. These varied colonial experiences furnished him with material for his long series of bushranging novels, of which *Robbery under Arms* is the most widely known. This book was published in 1888 in London after it had run as a serial in the *Sydney Mail.* Amongst his other books are *The Miner's Right* (1890); *A Modern Buccaneer* (1894); *The Babes in the Bush* (1900) and *A Tale of the Golden West* (1906). He died at South Yarra, Melbourne, March 11 1915.

BOLIVIA (*see* 4.166).—No census had been taken up to 1921 since the rough enumeration of 1900 indicating 1,816,271 inhabitants. In 1910 a Bolivian publicist estimated the pop. at 1,744,568. An official estimate in 1920 set the pop. at 2,500,000. The inhabitants are scattered through eight departments and three "national colonial territories," the most densely populated region being the department of La Paz. The pop. of the city of La Paz in 1920 was estimated at 107,252.

Government.—The fundamental law of Bolivia was in 1921 still the constitution adopted in 1880. In 1910 some changes were made in the official nomenclature of towns and cities; and in 1914 a law was promulgated which abolished *vice-cantons.* Although—according to the statutes—Sucré is still the capital of Bolivia and remains the seat of her Supreme Court, the seat of government is the city of La Paz, where the National Congress assembles regularly, the members of the Cabinet have their bureaus, and where the president of the republic lives.

Communications.—In accordance with the Treaty of Petropolis, (1903), the Brazilian Government began in Aug. 1907 to construct a railway round the series of cataracts in the Madeira and Mamoré rivers, from São Antonio on the Madeira river to Guajara Mérim on the Mamoré river (Brazil). The Madeira–Mamoré railroad was formally opened to traffic on July 15 1912. Bolivia then undertook to build a line between the Bolivian towns of Guajara Mérim and Riberalta on the Beni river, in order to link her rubber-producing region with Amazonian navigation. In accordance with Bolivia's treaty of 1904 with Chile, that Government constructed a railway from Arica to La Paz, which was completed May 13 1913. Thus Bolivia was furnished with a direct route to the Pacific. An electric railway, financed by New York capitalists, was being constructed in 1921 from La Paz to Corioco in the Yungas region,

and is to be extended to Puerto Pando. The Antofagasta and Oruro railway now reaches La Paz by its own tracks. A branch line has been constructed from Rio Mulato to Potosí. In Nov. 1916 the Bolivian Government began the construction of a difficult spur from Potosí to Sucré. Another branch from Oruro to Cochabamba was inaugurated in July 1917. A most important road was being constructed in 1921 between Uyuni and Tupiza near the Argentine frontier; trains were running between Uyuni and Atocha, while automobile service had been established between Atocha and La Quiaca (Argentina). Many miles of new telegraph lines have been built. Between July 1912 and Oct. 1916 the Marconi Telegraph Co. erected wireless stations at several points in Bolivia. On Oct. 20 1916 the first wireless message from La Paz was received in Lima.

Commerce.—Official figures show that in 1908 the total imports of Bolivia amounted to 40,807,856 bolivianos (see below under *Money and Banking*), while her exports came to 48,925,616. In 1915 the imports were 22,574,566 bolivianos; the exports 95,210,350. The countries taking the largest amounts of the exports were, in order: Great Britain, the United States, Argentina, France and Chile, while the countries furnishing the largest amounts of the imports were the United States, Peru, Great Britain, Chile and Argentina. The imports for 1918 amounted to 34,999,886 bolivianos, while the exports came to 182,612,850. This was an increase over the preceding year in imports of 1,519,055 bolivianos and in exports of 24,864,796. The chief articles imported into Bolivia in 1918 were valued as follows, in bolivianos: food products and beverages, 8,957,367; manufactured articles, 16,229,072; raw and slightly wrought materials, 7,022,630; live animals, 2,040,632. The most important articles of export were tin, 129,611,139 bolivianos, rubber, 11,038,042, wolfram, 10,591,429, and silver, 7,491,421. As contrasted with 1915 the figures for 1918 show that the United States had increased her imports from Bolivia about 200%, while Great Britain had increased hers about 37%; the figures for 1918 also show that the value of the imports of Bolivia from Great Britain had increased slightly, while imports from the United States had grown more than 137%.

Army.—The Bolivian soldiery is composed of the regular army and the reserves. Ordinarily the number of soldiers belonging to the regular army is fixed by Congress each year; in 1914 it was placed at 4,600 men. All male citizens between 19 and 49 years of age are compelled to serve in the regular army or in the reserves. The reserves in 1914 were estimated at 187,178 men.

Education.—A Bolivian sociologist declared in 1910 that less than 13% of his fellow-countrymen could read. Primary instruction is still managed by towns and cities. Considerable attention has recently been paid to the establishment of rural schools, as well as to the instruction of aborigines in the Spanish language. According to a report of the Secretary of Public Instruction, there were in 1916 about 450 primary schools in the Republic. In 1919 some 60,000 pupils were attending primary, secondary and normal schools. Secondary education is mainly carried on in *colegios nacionales* or in private academies. Methodists from the United States have founded an "American Institute" at La Paz, and also at Cochabamba: these academies are probably the best secondary schools in Bolivia. Bolivian teachers are mostly trained at four normal schools, the more important of these being at La Paz and Sucré. Higher education in Bolivia is peculiarly organized; for in addition to ecclesiastical seminaries, each department has at its capital an institution which is styled a university. Certain of these institutions have few university students: their instruction is mainly secondary. The university of La Paz furnishes instruction in law, medicine and theology.

Finances.—Early in 1908 Bolivia had only a small internal debt composed of bonds of various sorts. In Dec. of that year the Republic negotiated a loan with J. P. Morgan & Co. of New York amounting to £500,000. Subsequently three loans were floated in France to secure funds to promote banking enterprises; and another loan was raised in the United States for the construction of the railway from Tupiza to La Quiaca. Bolivia's proposed budget for 1919 estimated the revenue at 39,089,000 bolivianos, and the expenditure at the same amount. Proposed expenditures by departments were as follows in bolivianos: Treasury, 14,600,000; War, 6,300,000; Interior and Public Improvements, 5,500,000; Public Instruction, 3,100,000; Justice, 1,870,000; Worship, 58,000; and other expenditures, 7,661,000. On June 30 1919 the total foreign debt was £3,114,682. The internal debt was composed of bonds aggregating 19,456,165 bolivianos, and a floating debt of 10,477,471 bolivianos.

Money and Banking.—By a law of Dec. 31 1908 Bolivia virtually adopted the gold standard. Her monetary unit is the boliviano, which when at par is the equivalent of $0.389, U.S. currency. Both the English £ and the Peruvian *libra* (pound) are legal tender and ordinarily circulate at the equivalent of 12·50 bolivianos. A considerable amount of paper money is in circulation. Silver coins of 50 and 20 *centavos* circulate, as well as nickel and copper coins of smaller value. In 1919 the *Anuario Estadístico* listed the banks of Bolivia with capital in bolivianos as follows: the *Banco Nacional de Bolivia*, 9,000,000; the *Banco de la Nación Boliviano*, 18,962,500; the *Banco Mercantil*, 10,000,000; the *Banco Francisco Argandoña*, 4,000,000; the *Credit Hipotecaria de Bolivia*, 750,000; the *Banco Garantizador de Valores*, 100,000; and the *Banco Hipotecario Nacional*, 100,000.

History.—On Aug. 6 1909, President Montes was succeeded by Elidoro Villazón. Under him much economic progress took place: foreign commerce and national revenues increased, and railway and telegraph lines were constructed. Gen. Ismael Montes was again inaugurated president on Aug. 6 1913. During his new administration Bolivia felt the effects of the World War; there was a marked decline in her imports. Increased attention was paid to the mining of copper, tin and wolfram. José N. Gutiérrez Guerra, a Liberal who had served as Secretary of Finance under Montes, was inaugurated president in Aug. 1917. Shortly afterwards the agitation for an outlet to the Pacific reached an acute stage. In July 1920, because of intense opposition to his policy which apparently aimed at a *rapprochement* with Chile, Guerra was forced to resign, and was escorted out of Bolivia by way of Arica. Early in the following year Bautista Saavedra, a Republican, was elected president. He was inaugurated Jan. 29 1921.

According to a treaty with Peru, Sept. 17 1909, a survey of the Bolivian-Peruvian boundary was begun by a mixed commission in June 1910. By 1915 the commission had virtually completed the demarcation of limits, and wooden posts had been set up to mark the boundary. In the following year the two governments agreed to replace those posts by pillars of iron. Commissioners, appointed in accordance with the Treaty of Petropolis (1903), to survey the boundary line between Bolivia and Brazil, had by 1920 practically completed the task of demarcation. According to the protocol between Bolivia and Argentina dated Sept. 15 1911, surveys of the Bolivian-Argentine boundary line, which had been suspended since Oct. 1902, were resumed in 1913, and a joint commission placed iron stakes along parts of the line. A treaty signed at Asunción on April 5 1913 between Bolivia and Paraguay provided that their boundary dispute should be adjusted by direct negotiations. Commissioners of the parties soon undertook negotiations, documents were submitted in support of the respective claims, but no definitive decision had been reached in May 1921. Bolivia asserts a claim to territory on the right bank of the river, Paraguay from the mouth of the Pilcomayo river at least as far as lat. 22° S.

Early in the World War, Bolivia showed her sympathy with the cause of the Allies. Some young Bolivians proceeded to Europe and enlisted under the French flag. In Feb. 1917 Bolivia issued an invitation to the American nations asking them to unite in a declaration that submarine attacks upon neutral merchant vessels were contrary to all law. On April 13 1917 her Secretary of Foreign Relations gave the German envoy at La Paz his passports, declaring that, as a steamship navigating neutral waters with the Bolivian minister to Berlin on board had been torpedoed by a German submarine, the Government of Bolivia could no longer maintain diplomatic relations with the Imperial Government. Bolivia was represented at the Versailles Peace Conference, and on June 28 1919 her representative signed the Treaty of Peace with Germany. The Bolivian Government ratified the treaty on Nov. 16 1919. As a signatory of that treaty Bolivia became an original member of the League of Nations.

The question of an outlet to the Pacific raised by the territorial cessions of Bolivia to Chile as the result of the "War of the Pacific," was in 1921 a crucial international problem. The policy of Bolivia under various presidents had been to secure the sovereignty over territory containing an outlet to the Pacific Ocean. At times she had wished to secure the return from Chile of her former department upon the Pacific; at other times by negotiations with Chile she had aimed to acquire at least a portion of the former provinces of Tacna and Arica. Ex-President Montes, who was despatched to France as Minister of Bolivia by President Gutiérrez Guerra, presented to the Peace Conference a plea that his country should be given an outlet through Tacna. Evidently the new Bolivian régime was

in 1921 in harmony with the Peruvian Government with regard to the question. Bolivia's aspirations had apparently again turned toward the "revindication" of Antofagasta.

BOLO, PAUL (d. 1918), French financial agent and traitor, was born at Réunion, of humble parentage. He became at an early age a dentist in Marseilles, and afterwards appears for many years to have lived by his wits. In 1905 he made a bigamous marriage with the rich widow of a Bordeaux wine merchant. He entertained lavishly in Paris and Biarritz, and was received by many influential people, in spite of the fact that he underwent a term of imprisonment for fraud in connexion with one of his financial transactions. In 1914 Bolo met in Paris Abbas Hilmi, Khedive of Egypt, to whom he proposed various financial schemes, and the Khedive bestowed upon him the title of Pasha. On the outbreak of the World War Bolo appears to have entered into communication with German agents for the purpose of supporting a "defeatist" movement in certain Paris newspapers. In 1915–6 he travelled in the United States, and received considerable sums, amounting to over £300,000, from representatives of Count Bernstorff, at the time German ambassador to Washington. During 1917, however, the French Government under M. Clemenceau displayed much energy in hunting down treasonable conspiracies, and in Sept. 1917 Bolo was arrested. His trial by court-martial, begun on Feb. 4 1918, ended in his being found guilty of treason. Attempts were made to connect M. Caillaux with Bolo's proceedings, and Caillaux's acquaintance with the adventurer was brought up later to his discredit at his own trial in 1920. A sensational feature of Bolo's trial was the appearance of Monsignor Bolo, brother of the accused and a well-known preacher in Paris, as a witness for the defense, though as he had hardly seen his brother for thirty years, his evidence was of small value. Bolo was sentenced to death and shot at Vincennes, April 17 1918.

BOLSHEVISM, the name given since the Russian revolution to the form of Communism adopted under the Soviet system of government. Bolshevism as a doctrine and an organization is not of purely Russian growth; it is a branch of European Communism. The development of the latter is discussed in the article Communism. The earliest and most powerful expression of modern Communism is to be found in the Communist Manifesto drawn up by K. Marx and F. Engels in 1847. This Manifesto has remained a kind of gospel for extreme Communists, and its pronouncements served as a guidance in the attempt of the Russian Bolsheviks (Russian for "Majority" party) to create a Communist republic in Russia. Another element in the circle of ideas appropriated by the Bolsheviks was provided by the activity of Bakunin, the indefatigable Russian anarchist, who fought for world revolution in 1840 in Dresden and in 1870 in Lyons, and who passed 12 years of his life in prison and in exile. He was an admirer of Marx's learning and analytical power, but he would never submit to the tyrannical pedantry of Marx's school and stood up for an elemental awaking of revolutionary instincts. State and law were enemies to be fought and overthrown without any regard for tradition or practical considerations. A third element was introduced by the rise of militant syndicalism in France (*see* Syndicalism). These three currents combined to produce the three fundamental ideas of Bolshevism: the conquest of society by the proletariat class, the power of revolutionary instinct and the dictatorship of a compact minority.

The combination proved admirably adapted in Russia for the practical purpose of the overthrow of the previously existing order. Theoretically it was a compound of contradictory elements. This was clearly discerned and exposed by a leading Marxist writer, Kautsky. He said in his book on the *Dictatorship of the Proletariat:*—

"The Socialist party which governs Russia to-day gained power in fighting against other Socialist parties, and exercises its authority while excluding other Socialist parties from the executive.

"The antagonism of the two Socialist movements is not based on small personal jealousies: it is the clashing of two fundamentally distinct methods, that of democracy and that of dictatorship.

"For us, therefore, Socialism without democracy is unthinkable."

Kautsky had no difficulty in showing that, in consequence of this fundamental flaw, the practical results of Soviet rule were deplorable. It was obliged to work by means of an unwieldy bureaucracy:—

"The absolute rule of bureaucracy leads to its ossification, to arbitrariness and stultification. The forcible suppression of all opposition is its guiding principle. How can a dictatorship remain at the helm against the will of the majority of the people?

"In circumstances where the majority of the population mistrust the proletarian party, or stand aloof from it, this attitude would be shared by the bulk of the intellectuals. In that case, a victorious party would not only be without great intellectual superiority to the rest of the people, but would even be inferior to its opponents in this regard, although its outlook in general social matters might be a much higher one.

"The method of Paraguay is therefore not practicable in Europe. There remains to be considered the method adopted by Napoleon the First on Brumaire 18 1799, and his nephew, the third Napoleon, on Dec. 2 1852. This consists in governing by the aid of the superiority of a centralized organization to the unorganized masses of the people, and the superiority of military power, arising from the fact that the armed force of the Government is opposed to a people who are defenseless or tired of the armed struggle.

"Can a Socialist system of production be built up on this foundation? This means the organization of production by society, and requires economic self-government throughout the whole mass of the people. State organization of production by a bureaucracy, or by the dictatorship of a single section of the people, does not mean Socialism. Socialism presupposes that broad masses of the people have been accustomed to organization, that numerous economic and political organizations exist, and can develop in perfect freedom. The Socialist organization of Labour is not an affair of barracks."

No wonder that Lenin and Trotsky were highly incensed by Kautsky's criticism. They excommunicated him as a traitor to the cause, along with other Socialist leaders. But it was significant that they had to adopt the badge of "Communism" in order to mark their precise position in the field of rival doctrines. They had ceased to be Socialists in the accepted sense of the term.

The course taken by Bolshevist rule in Russia is narrated in the article Russia.

BOMBTHROWERS.—When, contrary to all expectation, and therefore to all ideas that had governed war preparations, the World War, instead of reaching its decision in the open field, came to the deadlock of trench warfare, there arose a demand for short-range engines which could throw bombs to a greater distance than was possible by hand, or, alternatively, could throw heavier bombs to the same distance.

Eventually this need was met by the development of trench mortars and trench guns, many types of which were loosely called bombthrowers, but all of which are differentiated from bombthrowers in the sense here meant by the fact that they used an explosive propellant. These are dealt with under Trench Ordnance. But in the first phases of trench warfare such ordnance either did not exist at all or existed only in such small numbers and in so imperfect a form, that for the needs of day-by-day trench warfare along the front temporary substitutes were evolved. To these substitutes the name "Bombthrower" is—so far as army usage is concerned—restricted.

They relied for their propulsive effort, like ancient and mediaeval engines, on the energy of springs. In some cases the spring was a system of powerful rubber pieces put in tension when the weapon was cocked and suddenly released by the pulling of a

trigger. In one case the source of power was an assemblage of coiled springs. In others, the rubber was replaced by a system of wire which, on being bent out of shape, stored up the power to reassert itself. In another, perhaps the last evolved during the war and certainly one of the most ingenious, centrifugal force was utilized, without previous storage of power.

Under the heading of bombthrowers as above defined should also come the class of pneumatic guns, certain representatives of which figured in the war on both sides, but owing to the general similarity of these to normal (*i.e.* explosive-propellant) trench ordnance they are treated along with the latter.

In naval usage, on the contrary, the term is applied to explosive-propellant derivatives of trench ordnance which were mounted on trawlers and other craft for the purpose of attacking submarines. The object was to throw for a certain distance very heavy charges of explosive that, equipped with a hydrostatic fuze, would act in the same way as depth charges. These bombthrowers are dealt with under ORDNANCE: *Naval Gunnery.*

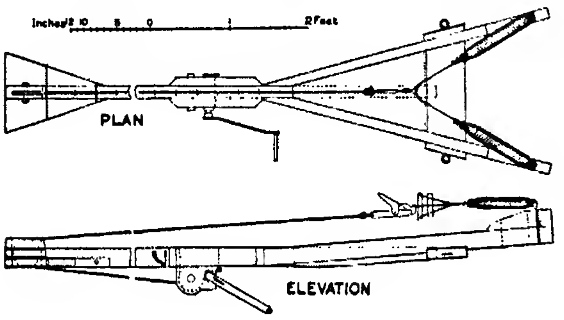

FIG. 1.

The first form of catapult to become a regulation weapon in the British army in France was the "Leach," used in 1915–6. This was a strong forked wooden frame (fig. 1) about 7 ft. in length from front to rear, the width at the splayed end or fork being about 1 ft. 10 in. Near the ends of the forked arms or "horns" were attached two sets of powerful rubbers, the rubbers of each set being firmly bound together at the extremities. The inner ends of these sets of rubbers were attached to the pouch or bomb receptacle of the catapult, which, when the rubbers were out of tension (and the pouch therefore in its forward position), was about 1 ft. 9 in. from the front of the fork. When, in order to fire, the rubbers were pulled back to extreme tension the pouch was less than a foot from the tail end of the frame. This pulling back was effected by a wire attached to the rear of the pocket, which passed round a pulley on the tail to a gear-box on the underside of the frame. This gear-box contained a winding-handle, gear, and a retaining-pawl; when the handle was turned, the wire was drawn into the gear-box (the pawl preventing its unwinding) and the rubbers extended. A bomb was then placed in the pouch, and on the word or signal to fire a trigger release broke the connexion between the pouch and the wire, and the rubbers, reasserting themselves violently, propelled the bomb.

With a heavy type of grenade weighing 1½ lb. the Leach catapult was capable with new rubbers of a range of 200 yd., and like other bombthrowers it possessed the important advantage, as against trench mortars, of invisibility and silence in action. The main disadvantage, the rapid wear of the rubbers, could be overcome by the frequent issue of replacements, the rubbers being regarded as "consumable" stores. There was, however, a limit to the practical usefulness of this cheap and efficient weapon. Its ranging powers were unnecessarily great for grenade work proper and not great enough for the tasks which came to be assigned to the trench mortar. Accordingly, a lighter and more portable weapon of the same type was designed later by Capt. G. H. Wicks of the British Trench Warfare Department. This was easily portable and manageable by one man, and ranged, with the 1½ lb. bomb, to about 100 yards. It was, however, not used in the field, as the line had by that time (1916) been drawn clearly between trench-ordnance projectiles and grenades. The heavy 1½ lb.–2 lb. grenade having ceased to exist, the necessity for a weapon to propel it ceased also.

The catapult of the French army, known as the "Sauterelle," was smaller and more portable, but correspondingly less powerful, than the Leach. It was a magnified crossbow, acting by the reassertion of springs bent in cocking.

The "West" spring gun, used by the British army in 1915 and to some extent in 1916, was a heavier and more powerful weapon. It derived its energy from a group of strong coiled springs; for extreme range, no less than 28 of these springs were brought into action. The general principle of action is shown in fig. 2. The weapon having been well bedded in with sandbags for steadiness, the throwing-arm which carries the bomb-cup is forced back-

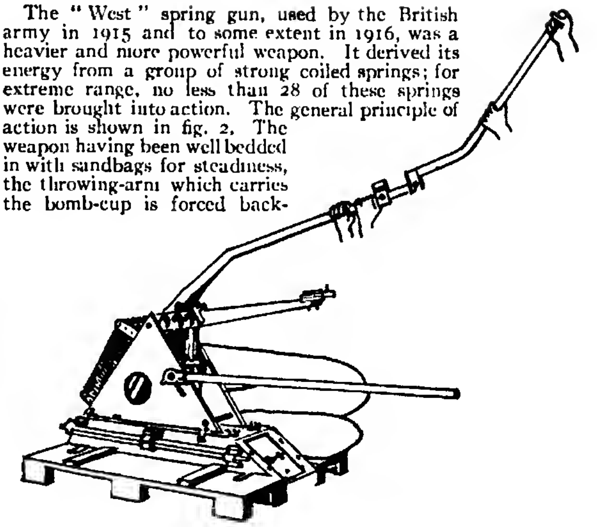

FIG. 2.

wards and downwards, against the resistance of the springs, by means of a long lever inserted in an appropriate position for leverage. When the "trigger bar" on this arm engages with a member called the trigger hook (visible in the drawing under the bomb-cup arm), the gun is cocked. The long lever is removed, a bomb placed in the bomb-cup, and the gun is then fired by pressing on the horizontal lever which actuates the trigger release. This disengages the trigger hook from the trigger bar, and under the force of the springs the throwing-arm, carrying the bomb, flies up. The range obtained with this weapon using a 2 lb. bomb was about 240 yd., 24 springs only being in action. Variation of range was obtained, as in the catapults, by varying the tension, but also, in this case, by adjustments of the position of the bomb in its cup. The West spring gun was an ingenious design, which probably comes near the limit of efficiency obtainable in applying the force of springs to an act of throwing. But it was heavy, and not very easily managed, and required as large an emplacement as a trench mortar.

The Minucciani bombthrower, though it appeared late in the war—after trench engines of the 1915 type had had their day—was probably the most efficient and ingenious weapon of its class. It was a large metal casing, circular, supported on a pedestal. Inside the casing was a revolving member, formed somewhat after the fashion of a centrifugal pump. Grenades of a special design (disc percussion) were fed into the "pump" through an opening in the casing, and when the pump was operated by turning a handle, they were expelled by centrifugal force through another opening in the casing. Extraordinarily high rates of fire combined with accuracy were obtained with this machine, which could throw the bombs practically as fast as they could be fed in, while, owing to their shape, the grenades themselves ranged well.

Other types of engine developed in the war for throwing grenades differed fundamentally from these in that an explosive propellant was employed. Setting aside certain throwers which are hardly distinguishable from light trench mortars (for which *see* TRENCH ORDNANCE) and throwing-devices attached to the service rifle (*see* GRENADE), there remains a type in which the grenade is formed with a sleeve tail and the thrower consists essentially of a peg over which this sleeve fits, the propellant charge being loaded into the sleeve. The action is thus exactly the reverse of that of a gun or trench mortar. An engine of this type, known as the "Hay pocket howitzer," was experimented with in Great Britain but never adopted as a service store. The Belgian "Van Deuren" type and the German *Granatwerfer*, on the contrary, were both used in large numbers and the latter especially played a part not only in trench warfare but in the open warfare of 1918 in which it was carried by the infantry in their advance for the purpose of reducing machine-gun nests.

The *Granatwerfer* of the German army was issued on a large scale, 12 being allowed for each infantry regiment. There were two models, of which the later, that of 1916, is here described.

The equipment comprised the thrower and baseplate (weighing 53 lb.) and a metal platform (weighing 35 lb.). The "gun" (see fig. 3) consisted of a cylindrical firing-peg screwed into a body. This body (which was provided with a carrying handle) had at its rear end trunnions which rested in trunnion seatings fixed to a small baseplate, as in German trench mortars. Elevation was given by clamping the body at the desired angle to an arc on the left side which was rigidly attached to the baseplate. Laying for direction was done by moving the baseplate (and with it the whole system)

round a pivot situated at the front end of the platform, and clamping it when on the desired line.

The grenade as such is dealt with under GRENADE while this article is concerned only with its tail. This is a hollow tube, fitting over the firing-peg, and having at the inner end of the cavity a propellant charge contained in either a service rifle cartridge (with the bullet removed) or else a capsule with a percussion cap. The interior of the firing-peg is formed in somewhat the same way as the interior of a rifle-bolt, that is, it carries a striker, striker-rod and striker-spring which are controlled by a trigger. On the right side is a cocking-lever by which the striker-rod is forced back against its spring till the notch formed on it is engaged by the sear of the trigger. When the

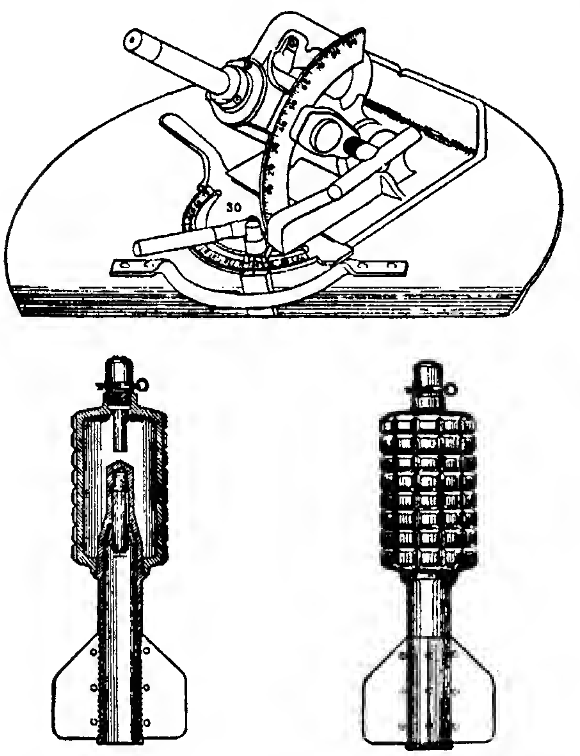

FIG. 3.

grenade, with its propellant cartridge or capsule, is placed on the peg and the safety pin of its fuze withdrawn, the trigger lanyard is pulled, the sear frees the striker rod, which is impelled forward by its spring and fires the cartridge cap, exactly as in a rifle. Until 1918 this weapon used only simple H.E. bombs. In that year a second type was introduced in which a small repellant charge in the head of the bomb was fired on impact with the ground, causing it to rebound and so to burst in air instead of burying itself. The ordinary (1915 model) grenade weighed 1·85 kgm. (4 lb.) and had a range of about 330 yards. The bouncing bomb was heavier (2·5 kgm., 5½ lb.) and ranged only to 275 yards. (C. F. A.)

BOMBTHROWERS, NAVAL: *see* ORDNANCE.

BONE, MUIRHEAD (1876–), British etcher and painter, was born at Glasgow in 1876. He was educated at Glasgow, afterwards studying in the school of art in that city, and in 1897 and the following years produced some excellent work in black and white for the *Scots Pictorial.* He established himself in London in 1901, where he quickly made a reputation by his etchings. He was elected to the New English Art Club, and was prominent in founding the Society of Twelve. In 1906 his etching "The Great Gantry, Charing Cross," was bought by the National Art Collections Fund and presented to the British Museum. During the World War his services were enlisted by the British War Office for the production of pictures of the western front, and some of these were subsequently reproduced in volume form.

BONI, GIACOMO (1859–), Italian archaeologist, was born at Venice April 25 1859 and educated in Venice, Pisa and in Austria and Germany largely by making student journeys through the provinces of the ancient Roman Empire. He became successively superintendent of the architectural school of the Royal Academy of Venice, inspector of antiquities under the Ministry of Public Instruction, commissioner for the monuments of Rome, and, in especial, director of the excavations in the Roman Forum and on the Palatine Hill, begun in 1899 (*see* 23.591 *et seq.*). These he has described in numerous reports, and he has also published a report on the Campanile of St. Mark's at Venice, which was rebuilt under his direction and completed in 1910. He was given honorary degrees by both Oxford and Cambridge, and is a member of the Superior Council of Antiquities and Fine Arts for the kingdom of Italy. In 1918 he unearthed on the Palatine Hill a Greek marble statue of Victory dating back to the 5th century B.C. Besides his reports on Roman antiquities he published *Hibernica,* notes on burial places and customs of ancient Ireland (Eng. trans. 1906).

BOOT, SIR JESSE, BART. (1850), British business man, was born at Nottingham June 2 1850. He started a retail chemist's business in a small way in that town, but gradually extended it until branches were established, with factories in connexion, in most of the towns in the United Kingdom. He became chairman of Boot's Pure Drug Co., Ltd., and also of Boot's Cash Chemists, Ltd., which later added lending libraries and departments for the sale of fancy goods to the various chemist's shops under their control. In 1920 he sold the whole of his business to the United Drug Co. of America, under whose control a new company was formed with the title Liggett's International, Ltd., for the purpose of taking over other drug concerns in England and Canada. In 1921 he formed Sir Jesse Boot's Social Trust, Ltd., a registered company with nominal capital £50,000 in 10,000 £5 shares, to find out "by investigation the best means of removing or alleviating poverty, distress, and other social evils, and promoting social service." He became its chairman and governing director, his wife and Mr. J. W. Briggs, secretary of the Notts. C.O.S., being the other directors. He received a knighthood in 1909 and a baronetcy in 1916.

BOOTH, CHARLES (1840–1916), English sociologist (*see* 4.238), died at Gracedieu Manor, Leicester, Nov. 23 1916. A tablet to his memory, erected in the crypt of St. Paul's cathedral, London, was unveiled by Mr. Austen Chamberlain Dec. 15 1920.

BOOTH, WILLIAM (1829–1912), "General" and founder of the Salvation Army (*see* 4.239). Towards the close of his life he became blind through cataract, losing the sight of one eye in 1909, and of the other, after an operation, three months before his death. But he had continued to direct the operations of the Salvation Army, and learned to write without the aid of sight. As late as 1909 he had undertaken his sixth motor-car campaign. His last public appearance was made at the Albert Hall, London, May 9 1912, at a meeting to celebrate his 83rd birthday. He died in London Aug. 20 1912. His intense faith, profound and tireless sympathy, and disinterested devotion, had won for "General" Booth a unique place in the social and religious world. In the early nineties of the 19th century he might have passed away simply as the fanatical hot-gospeller of a new sect of street-corner psalm-singers; it would have been incredible then that he should end his life as one for whom Westminster Abbey was seriously suggested as an appropriate resting-place, one of the autocrats of the religious world, the creator of a world-wide organization of social service.

His son, WILLIAM BRAMWELL BOOTH (b. 1856), was chief-of-staff to the Salvation Army from 1880 to 1912, and succeeded his father as "general" in 1912. His wife, whom he married in 1882, had been commissioner and leader of the women's social work of the Salvation Army in the United Kingdom since 1884. In 1920 she was made J.P. for the County of London, and in 1921 was elected one of the visiting justices for Holloway prison, where women convicts are confined.

BORAH, WILLIAM EDGAR (1865–), American politician, was born at Fairfield, Ill., June 29 1865. He studied at the Enfield, Ill., Academy and entered the university of Kansas with the class of 1889, but did not finish his course. He was

admitted to the bar in 1889, practised at Lyons, Kansas, 1890-1, and thereafter at Boise, Idaho. He was an unsuccessful candidate for the U.S. Senate in 1902, but was elected in 1907 and again in 1913 and 1919. At the time of the split in the Republican party in 1912 he opposed the nomination of President Taft but refused to bolt and follow Roosevelt, although in sympathy with his policies. In 1913 he was a vigorous opponent of Secretary Bryan's proposal to create a U.S. protectorate over Nicaragua. The same year he introduced an unsuccessful bill for raising the income tax exemption to $4,000. He had long favoured a Federal levy on incomes but thought that with the then existing system of indirect taxation the additional burden should fall upon the well-to-do. He favoured woman suffrage and independence of the Philippines, but was opposed to the league to enforce peace on the ground that it tended toward internationalism. He strongly opposed many of the measures of President Wilson's administration, and in particular the League of Nations, against which, as a delegate-at-large from his state, he was an effective speaker at the Republican National Convention of 1920.

BORDEN, SIR FREDERICK WILLIAM (1847-1917), Canadian statesman (*see* 4.245), failed to secure reëlection to the Dominion Parliament in 1911 and retired from politics. He had been created K.C.M.G. in 1902 on the occasion of the coronation of Edward VII. He died at Toronto Jan. 6 1917.

BORDEN, SIR ROBERT LAIRD (1854-   ), Canadian statesman (*see* 4.245), became leader of the Conservative Opposition in the Canadian House of Commons in Feb. 1901, on the resignation of Sir Charles Tupper. This position he held until 1911, when the Laurier Administration was defeated on the Taft-Fielding Reciprocity Compact with the United States; he was then called upon to form in Oct. 1911 a new administration and was sworn of the Privy Council Jan. 1 1912, taking office as president of the King's Privy Council of Canada in the new Cabinet. For the purpose of more effectively carrying on Canada's part in the World War he formed, in Oct. 1917, a Union Government, comprising members of both the Liberal and Conservative parties, in which he took office as Secretary of State for External Affairs. The Union Government was returned to power in the general election of Dec. 17 1917. Borden was a member of the Imperial War Cabinet and Imperial War Conference 1917-8 held in London, England, but owing to ill health resigned the premiership in 1919. He was created G.C.M.G. in 1914.

BORGLUM, GUTZON (1867-   ), American sculptor, was born in Idaho, March 25 1867. His father was a physician who emigrated from Denmark in 1864. He was educated at St. Mary's College, Kan., studied art at the school of the San Francisco (Cal.) Art Association, and during 1890-3 attended the Académie Julien and the École des Beaux Arts in Paris. He then returned to America for a year, but in 1896 went to London, and during the next five years exhibited much sculpture and painting there and in Paris. In 1902 he moved his studio to New York. In 1904 he received a gold medal for sculpture at the St. Louis Exposition. He was a member of numerous organizations, including the Royal Society of British Artists and the Société Nationale des Beaux Arts, France. He was a disciple of Rodin and a leader of the insurgency in America. His theory of representing history by sculpture is thoroughly in accord with that of ancient Greece. The huge scale of many of his conceptions can be compared only with that of antique Oriental monuments. For example, he proposed a Confederate memorial on Stone Mt. near Atlanta, Ga., to be cut in relief along the face of that granite mountain as a frieze representing an army on the march, conspicuous from a great distance. In 1919 he exhibited a head of Lincoln cut from a block weighing six tons. The same year he was chosen to design a monument for Warsaw, commemorating the rebirth of Poland. Among his colossal figures are the Twelve Apostles for the cathedral of St. John the Divine, in New York, and another head of Lincoln in the rotunda of the Capitol at Washington. Other works include the Sheridan monument in Washington; "Mares of Diomedes" and "Ruskin" in the Metropolitan Museum of Art, New York; statue of Lincoln, Newark, N.J.; statue of Henry Ward Beecher, Brooklyn; the Wyatt Memorial, Raleigh, N.C.; "The Flyer" at the university of Virginia; gargoyles for a Princeton dormitory; "Wonderment of Motherhood" and "Conception."

BORGLUM, SOLON HANNIBAL (1868-1922), American sculptor (*see* 4.250), brother of the foregoing, completed many important statues after 1910, including "God's Command to Retreat" (1911, Napoleon on horseback in a snow drift, bronze); "Jacob Leisler," first governor of New Amsterdam (1911, heroic figure in bronze at New Rochelle, N.Y.); "Reverie of a Pioneer" (colossal equestrian for the Court of Honour, San Francisco Exposition); "Backin' 'Em Up" (1919, four dismounted cavalrymen, with horses); "The Little Lady of the Dew" (unveiled 1920 in the churchyard of St. Mark's in the Bouwerie, New York City); "Inspiration" and "Aspiration" (1920, two statues of Indians, in stone, both at St. Mark's in the Bouwerie). He was Y.M.C.A. secretary with the French army in 1918, won the Croix de Guerre, and later was engaged in work with the A.E.F. in France. He died Jan. 31 1922.

BORIS III. (1894-   ), King of Bulgaria, eldest son of King Ferdinand (*see* 10.260) and of Marie Louise de Bourbon, eldest daughter of Duke Robert of Parma, was born at Sofia, Jan. 30 1894. Although his parents were Roman Catholics, the prince was, on Feb. 14 1896, received into the Orthodox church, the Tsar Nicholas II. being his god father. He was educated entirely in Bulgaria, first by tutors and later at the cadet and officers' schools, serving subsequently as A.D.C. to the King and to various generals. On the abdication of King Ferdinand, immediately after the Armistice which put an end to Bulgaria's disastrous share in the World War, Boris succeeded his father, Oct. 4 1918.

BORNET, JEAN BAPTISTE EDOUARD (1828-1911), French botanist, was born at Guérigny Sept. 2 1828. Details of his special work on algae and lichens will be found in 1.590, 16.578 and 26.899. He was elected a member of the Académie des Sciences in 1886 and received the gold medal of the Linnean Society in 1891. He died in Paris Dec. 17 1911.

BOROEVIC VON BOJNA, SVETOZAR (1856-1920), Austro-Hungarian field-marshal, was born at Umetic in Croatia. As a young officer of infantry he served through the campaign for the occupation of Bosnia in 1878, and afterwards on the general staff until he reached the rank of general. In the World War he first led the VI. Corps in the victorious battle of Komarow, and as commander of the 3rd Army beat off the Russian attacks in the Carpathians until May 1915. He then took over the command on the Isonzo. His name is for ever associated with the 11 victorious battles fought in the defence against Italian armies twice as numerous as the Austrians and considerably better equipped. After the collapse of the monarchy the Yugoslav Government refused the "black and yellow" general permission to return to his province.

Boroevic embodies the type of the Croat general of the past in the more polished mould of the present. By iron industry he had acquired the fullest mastery of the science of war, as a general in the field he was distinguished by his intuitive judgment of the enemy, by his tenacious energy, and by his ingenuity as a tactician.

BOSANQUET, BERNARD (1848-   ), English philosopher, was born at Rock, near Alnwick, June 14 1848. Educated at Harrow and Balliol College, Oxford, he was for ten years a lecturer at University College, Oxford (1871-81). In 1881 he came to London, and until 1897 engaged in lecturing and social work. He married in 1895 Helen Dendy, herself the author of books on social problems. During 1903-8 he was professor of moral philosophy at St. Andrew's University. He became a fellow of the British Academy. A Hegelian in philosophy and a disciple of T. H. Green, his logical tenets are described in 16.886, 888 and 917.

Amongst his published works are *Knowledge and Reality* (1885); *Logic, or the Morphology of Knowledge* (1888); *Essentials of Logic*

(1895); *Psychology of the Moral Self* (1897); *Principles of Individuality* (1911); *What Religion Is* (1920) as well as translations of Hegel and Lotze.

BOSNIA-HERZEGOVINA (*see* 4.270).—Until Oct. 1918 Bosnia-Herzegovina remained a territory of the Austro-Hungarian Empire. A proclamation issued on the occasion of its annexation to the Habsburg Monarchy in 1908 promised these lands constitutional institutions, which should secure to their inhabitants full civil rights and a share in the management of their own affairs by means of a local representative assembly. In performance of this promise a constitution was promulgated on Feb. 10 1910. This included a Territorial Statute (*Landesstatut*) with the setting up of a Territorial Diet, regulations for the election and procedure of the Diet, a law of associations, a law of public meetings, and a law dealing with the district councils (*Bezirksräte*).

According to this statute Bosnia-Herzegovina formed a single administrative territory under the responsible direction and supervision of the Ministry of Finance of the Dual Monarchy in Vienna. The administration of the country, together with the carrying out of the laws, devolved upon the Territorial Government in Sarajevo, which was subordinate and responsible to the Common Ministry of Finance. The existing judicial and administrative authorities of the Territory retained their previous organization and functions. The statute guaranteed generally the civil rights of the inhabitants of the Territory, namely citizenship, personal liberty, protection by the competent judicial authorities, liberty of creed and conscience, preservation of the national individuality and language, freedom of speech, freedom of learning and education, inviolability of the domicile, secrecy of posts and telegraphs, inviolability of property, the right of petition, and finally the right of holding meetings.

The Diet (*Sabor*) set up consisted of a single Chamber, elected on the principle of the representation of interests. It numbered 92 members. Of these 20 consisted of representatives of all the religious confessions; the president of the Supreme Court, the president of the Chamber of Advocates, the president of the Chamber of Commerce, and the mayor of Sarajevo. In addition to these were 72 deputies, elected by three *curiae* or electoral groups. The first *curia* included the large landowners, the highest taxpayers, and people who had reached a certain standard of education without regard to the amount they paid in taxes. To the second *curia* belonged inhabitants of the towns not qualified to vote in the first; to the third, country dwellers disqualified in the same way. With this curial system was combined the grouping of the mandates and of the electors according to the three dominant creeds (Catholic, Serbian Orthodox, Moslem). To the adherents of other creeds the right was conceded of voting with one or other of the religious electoral bodies within the *curia* to which they belonged.

All males 24 years of age, and natives of and residing in the Territory, possessed the franchise, as also Austrian and Hungarian citizens engaged as officials in the administration and on the railways in Bosnia-Herzegovina. Qualifications for election as deputy were the same as for the franchise, save that the minimum age limit was fixed at 30, and public officials and teachers were excluded. The law on district councils created a district council (*Bezirksrat*) for every district (*Bezirk*) to take part in the administration of local public affairs.

The Diet.—On June 25 1910 the first session of the Diet of Bosnia-Herzegovina was opened. Shortly before this the Emperor Francis Joseph had visited the country for the first time, and had met with an enthusiastic reception. The Diet was composed of three great religious parties. The strongest was that of the Serbs (Orthodox), the next that of the Moslems (Mahommedan), and lastly that of the Croats (Catholics). Each of these parties struggled for the hegemony, but since none commanded a majority, efforts at coalition began among the three groups. The opposition between Serbs and Croats, which had come more sharply into evidence after the annexation, had become softened, and all three parties combined in a demand for far-reaching autonomy. The constitution had not contented the political parties, since it did not satisfy the desire in the country for full self-government. The Government had not a strong majority on the opening of the Diet, but under the favourable impression produced by the Emperor's visit, the first budget laid before the Diet was approved even by the opposition groups, and in this the Government saw also a kind of vote of indemnity for their administration in pre-constitutional times. The Diet started a fruitful activity, and the Government was able to secure a majority, consisting of Croats, Moslems and moderate Serbs.

In the spring of 1911, during the discussion of the Road Construction Bill, the language question for the first time led to quarrels in the Diet in connexion with the notices on signposts; throughout the year party wrangles, discontent with the constitution, and the obstructive tactics of the radical Serbs hampered business; and the Government no longer had a certain majority. Early in 1912 the Austro-Hungarian Minister of Finance, Baron Burian—the author of the Bosnian constitution—resigned office, and was succeeded by Ritter Leo von Bilinski. To the new minister the representatives of the various parties in the Diet presented a memorandum asking for a revision of the constitution and of the rules of procedure in the Diet; for an alteration of the electoral law; for a Government responsible to the Diet and at least partly recruited from among its members; for an extension of the sphere of activity of the Territorial Government in political and economic matters; for an independent policy of railway rates, the appointment of an audit office for the financial control of the Government, and the regulation of the language to be used by officials and functionaries. The object for which the parties were striving became more and more evident: the greatest possible autonomy for the Territory of Bosnia-Herzegovina and independence of the central Government of Vienna. With the rejection of the budget of 1912 began an open conflict between the Government and the parties in the Diet, which had as its result a long pause in the activity of the Diet.

After wearisome negotiations and the acceptance by the Government of a series of the demands set forth in the memorandum, a combination of Croats, Moslems and moderate Serbs, in a working majority, was arrived at during the summer of 1912, under which conditions the third session of the Diet was opened on Oct. 22. The Government succeeded in obtaining the indemnity for the 1912 budget, and passed through the Diet a great number of the laws which it had drafted. New difficulties cropped up in the discussions of the proposed law on the language question. The draft law specified Serbo-Croatian as the future official language in all affairs, both internal and external, connected with the civil administration, with public educational establishments, and State railways so far as their external traffic was concerned. The parties also demanded Serbo-Croatian as the official language of the railways in Bosnia-Herzegovina itself; but this the Government refused to concede; and, since no agreement could be reached, the Diet was prorogued, and the fourth session was not opened until Dec. 20 1913.

For this session the Government had managed to secure a working majority consisting of Croats, Moslems and moderate Serbs. The language law and several other important measures were passed. A resolution was also carried in support of a law drafted by the Government with a view to a solution of the agrarian question which should do equal justice to the interests of the landlords and the *Kmets* (*see* AGRARIAN QUESTION p. 474).

The business of the Diet was suddenly interrupted by the assassination of the Archduke Francis Ferdinand at Sarajevo on June 28 1914. The session was closed on July 9, and on Feb. 5 1915 the Diet was dissolved. Owing to later political developments, ending with the break-up of the Austro-Hungarian Monarchy, there were no new elections. In spite of political obstacles the Diet had done much towards the development of the constitution, and during its four sessions had framed

numerous laws, many of which were important. Their discussion was generally conducted on a notably high plane and bore witness to a thorough and many-sided examination of the matters requiring consideration.

Administration.—According to the census of 1910 the pop. of Bosnia-Herzegovina on Oct. 10 1910 numbered 1,898,044 persons, of whom 52·4 % were males and 47·6 % females. As compared with the year 1895 the population showed an increase of 21 %. The civil pop. of the capital, Sarajevo, had risen from 38,000 to 51,900 persons. According to religion the population was divided as follows:—

825,418	Serbian Orthodox	=43·5 %
612,137	Moslems	=32·3 %
434,061	Catholics	=22·9 %

The remainder was composed of other religious creeds. According to occupation the figures were:—

Agriculture	87 %
Industry	5·5 %
Trade and Commerce	3 %
and in the public service and the liberal professions in round numbers	2 %

Of the whole pop. from the age of seven upwards 87·84 % were illiterate. The part taken in the public service by the indigenous element was on the increase (in 1908, 31 %; in 1910, 44·5 % of all public officials).

Pupils of the secondary schools in Bosnia-Herzegovina who passed on to the universities or other higher educational institutions of the monarchy, on their return entered the Government service or the liberal professions.

The number of public schools in Bosnia-Herzegovina during the period 1910–8 was, at its highest, as follows: 568 elementary schools, 4 higher elementary girls' schools, 3 training colleges for male and female teachers, 9 trade schools, 1 commercial academy, 2 technical schools, 1 special technical school, 4 grammar schools (*Gymnasien*), 2 higher *Realschulen*, 1 lower *Realgymnasium*, 1 military lower *Realschule*, 3 theological colleges.

In addition to these there were numerous denominational and private elementary schools, Turkish *mektebs* and *medresses* (lower and upper Moslem schools) and three private grammar schools. In 1911 the Diet unanimously decided upon compulsory school attendance for four years for children over seven years of age. In 1885 the *Landesmuseum* was founded, and provided with a modern building in 1912. It contains collections of scientific, artistic and historical interest. In 1912 was established the Bosnian and Herzegovinian Institute for research connected with the Balkan Peninsula. Worth attention are the *Wissenschaftliche Mitteilungen aus Bosnien und Hercegovina*, published by the Museum, of which the 13th and last volume appeared in 1916.

The Press underwent a rapid development. In 1914 there appeared 43 periodicals, six of which were daily papers, three weeklies, and 32 monthlies. Of these 38 were published in the Serbo-Croatian, two in German, and the rest in both languages. There was also a great increase in clubs and societies, which in 1913 numbered 833 with 102,000 members, one-third of them being Serb.

The Agrarian Question.—Shortly before the opening of the Diet in 1910 a strong agitation had begun among the *Kmets*, *i.e.*, peasants holding of the great landlords under the *métayage* system and, in some cases, by personal services in addition (*see* 4.280). In 1911 the Diet unanimously passed a law for the conversion of these tenancies into freeholds by voluntary agreement between landlords and tenants with Government assistance. For this purpose the Government was empowered to issue bonds (*Kmetenablosungsobligationen*), and a special office (*Kmetenablosungsamt*), akin to the Irish Land Commission, was established at Sarajevo to carry out the law. The process of redemption now proceeded rapidly. Whereas during the 33 years (1879–1911) 32,681 Kmet tenancies had been converted into freeholds at a cost of 29 million kronen, 13,371 were converted between June 1911 and the end of 1915. According to the calculations of the Sarajevo office, redemption in this form, which proceeded without friction and had no unfavourable influence on the existing agrarian situation, would have been completed within 20 years.

Military Service.—In the year 1913 a new military service law came into force in Bosnia-Herzegovina, by which the liability for military service was put on the same footing as that in Austria-Hungary. The *Landsturm* was not introduced into Bosnia-Herzegovina, but in its place the 2nd and 3rd Reserves were formed. Liability for military service began with the completion of the 19th year of age, and ended in the year in which the man liable for service completed his 42nd year. By a law of 1915 the military service law was modified to make the liability for service for the duration of the war extend from the end of the 18th to the end of the 50th year of age. The military establishment for Bosnia-Herzegovina comprised four infantry regiments and one *Feldjäger* battalion.

Public Health.—In the field of public health the Diet decreed in 1914 the extension of the Territorial hospital in Sarajevo, and the erection of larger hospitals in the chief town of each district (*Kreis*) and of smaller hospitals in the chief town of each sub-district (*Bezirk*), and granted 12 million kronen for this purpose. The execution of this decree was interrupted by the war, but an open-air hospital for tuberculous patients was erected in Sarajevo. The water supply of Sarajevo was extended, and in 11 towns a water supply was either newly provided or extended. The coöperation of the town councils in the sphere of public health and other administrative affairs was of considerable importance. The budget of the Sarajevo town council for 1914 made a demand for 4 million kronen, those of all the other town councils together 5 million kronen. In many places electric light was introduced.

Justice.—In the sphere of justice the independence of judges in the exercise of their judicial functions, and their security of tenure, were established by law, together with the responsibility of the judges for damage caused by a breach of their professional duty. Inspectors of the law courts were introduced, the setting up of a house of correction for women in Zenica was decreed, and law courts erected in Sarajevo which included all the courts in Sarajevo and the prison. In 1914 an audit office was set up to supervise the expenditure of the administration.

Agriculture.—The most important branch of production in Bosnia-Herzegovina had always been agriculture, in which 87 % of the population were employed. The efforts of the Government for the improvement of agriculture (agricultural departments, schools of viticulture and fruit culture, ploughing demonstrations, loans for implements, instruction in agriculture, schools of rural economy, Sunday instruction) were continued.

The statistics of the harvest for the most important crops in 1914 were:—

	Cwt.
Wheat	2,024,000
Barley	1,400,000
Oats	2,171,000
Maize	6,272,000

Among fruit crops the leading one is that of plums, which was always of the highest importance. The crop statistics of this kind of fruit fluctuated greatly:—

1912: in a raw state	330,715 cwt.
1914: in a raw state	6,877,000 cwt.

Of the 1914 crop there were also 2,161,000 cwt. dried plums; 25,600 cwt. were converted into *Lequar* (pulp) and 1,570,000 cwt. devoted to immediate consumption. The residue was used for making the liqueur known as *Slivovitz*.

Stock-breeding plays a great part in the agriculture of Bosnia-Herzegovina, being favoured by the extraordinarily rich production of hay. The census of cattle in 1910 produced the following figures for live stock:—

Horses, asses and mules	228,831 head
Cattle	1,309,922 head
Goats	1,393,068 head
Sheep	2,499,422 head
Pigs	527,271 head

Industries and Manufactures.—Industry is rapidly developing in Bosnia-Herzegovina, and is principally directed towards the exploitation of the natural resources of the country, *e.g.* in forestry, mining, and manufactures of chemicals and tobacco. To forestry and mining in particular great importance attaches. The total area under forest in Bosnia amounts to 50 % of the whole, or 9,800 sq. m., 75·8 % of which are State forests, the rest private property or *Vakuf* belonging to Moslem religious foundations; 60 % of the woodlands are marked out for timber forests. The exploitation of these woods supports many great forestry establishments employing large capital. In 1913 there were in the country 31 steam saw-mills, whose plant for transportation of wood comprised 176 m. of gravitation lines and 630 m. of steam railways. In the period 1913–6 1,230,000 tons of forest products were exported, a value of 83·5 million kronen.

Among mining industries the first place is occupied by the coal mines, financed by the Territorial treasury, of Tuzla, Zenica, Kakanj-Doboj, Breza, Banjaluka, Ugljevik, and Maslovare which produced on an average 800,000 to 1,000,000 tons of coal yearly. Of these mines Maslovare was newly opened in 1917.

Bosnia's production of iron ore is rich. From 1891 onwards Vareš had already been occupied in the production of ore and its conversion into pig-iron and other foundry products, but the working of the great ore deposits of Ljubija near Prijedor was only begun during the war, and the raising of the necessary capital (about 16 million kronen) undertaken. The works can cope with a daily production and transport of 300 waggonloads of ore. The deposits consist of a high-grade iron ore showing a proportion of up to 50 % of iron.

In 1912 a Geological Institute was set up, the most important task undertaken by which was the construction of a new geological map of Bosnia and Herzegovina. The general map was planned to consist of six sheets on a scale of 1/200,000, and in 1921 the sections Sarajevo and Tuzla had been issued.

Among the chemical and other industries existing in 1910–8 were: one alkali factory, one carbide and chloride of lime factory, one salt distillery, one cellulose factory, one petroleum refinery, one alcohol distillery, several breweries, a sugar manufactory and, finally, four tobacco factories.

For the protection of workmen compulsory sickness insurance was introduced in 1910, and preparations were completed for legislation as to compulsory accident insurance for workmen. **An industrial inspector had already been appointed before this.**

Finance and Trade.—Numerous new credit institutions were at the disposal of the economy of Bosnia and Herzegovina. The Austro-Hungarian Bank set up three branch establishments in the country, and in addition 15 new credit institutions were founded, among them the Serbian and Moslem Central Bank which, together with the Croatian Central Bank, which was founded earlier, represent native capital. In 1910 a Post Office Savings Bank was set up.

The chief statistics of foreign trade were published annually by the statistical department. The last publication appeared in 1913:—

Imports: 460,000 tons of goods and 40,000 head of cattle (in round figures).

Exports: 1,090,000 tons of goods, and 207,000 head of cattle.

The total turnover of foreign trade in 1913 amounted to 338·8 million kronen, 59.2 % of which represented imports and 40·8 % exports.

The export and import of goods in the years 1910–3 amounted to the following:—

	Tons	Mill. Kr.
Imports		
1910—	303,800	144·5
1911—	352,800	154
1912—	392,000	174
1913 —	460,600	200·7
Exports		
1910—	1,078,000	132·9
1911—	1,058,000	121·8
1912—	1,078,000	130·2
1913 —	1,087,800	138·1

There were in the period 1910 8 1,300 m. of main roads and 930 m. of railways. A law was passed by the Diet sanctioning the construction of 463 m. of new railways on the normal gauge and 65 m. narrow gauge, including the new sections Banjaluka–Jajce, Šamac–Doboj, Bugojno–Aržano, Bugojno–Rama, Brčko–Tuzla–Bjelina–Rača. The costs were estimated at 270 million kronen. For payment of the interest and sinking-fund on this loan Austria and Hungary pledged themselves to pay a yearly contribution of 10 million kronen for 60 years. Of these projected lines construction was begun in 1914 on the sections Banjaluka–Jajce, Bugojno–Aržano, and Šamac–Doboj but interrupted owing to the outbreak of war. The construction of the section Nivi-Bihač was begun in 1914 and continued during the war.

The traffic on the State railways of Bosnia-Herzegovina amounted to:—

Goods Traffic

1910	225 million net kilometre tons
1913	284 million net kilometre tons

Passenger Traffic

1910	119 million
1913	181 million.

During the period of the war the traffic showed a decrease in goods, but an increase in passenger-travelling owing to army transport.

The economic and cultural development of Bosnia-Herzegovina from the first years of the occupation till the end of the Austro-Hungarian Government is reflected in the development of the budget to the administration of these territories. The first complete budget was drawn up in the year 1880, and provided for expenses to the amount of 6 million gulden (12 million kronen). In the year 1914 the expenses amounted to 110 million kronen with an equal credit balance. The administrative expenses and the revenue thus increased nearly tenfold in the period 1878 1918. Financial activity during this time was considerable, and based exclusively on money raised in the country. For the construction of railways and common undertakings loans were raised which produced in round figures 200 million kronen.

With the break-up of the Austro-Hungarian Monarchy in Oct. 1918 Austro-Hungarian rule in Bosnia-Herzegovina also came to an end. On Nov. 1 1918 the newly formed National Government (*Narodna Vlada*) in Sarajevo declared that it took over the government of the country and broke off all connexions with the former central Government in Vienna. Subsequently the territories of Bosnia-Herzegovina proclaimed their union with the newly founded State of the Serbs, Croats and Slovenes.

(O. v. K.)

BOSTON (*see* 4.290).—The pop. of the area incorporated as "the City of Boston" was in 1920, 748,060; in 1910, 670,585, an increase of 77,475 or 11·6%, being by far the smallest percentage of increase in the history of the city, and the smallest numerical increase for 50 years. But the two figures are not precisely comparable, as the municipal area was increased from 43 to 48 sq. m. in 1912 by the inclusion of Hyde Park which in 1910 had a pop. of 15.507. During the five years 1915–20 the increase of pop. was less than 1%. The "metropolitan area," constituted by the Legislature of Massachusetts for certain purposes of common action, includes in addition to municipal Boston 38 adjacent cities and towns and had in 1920 a pop. of 1,641,756 (according to the provisional U.S. census returns), and in 1910 1,423,439. The percentage of pop. in "the city" as compared with that of the "metropolitan" area thus decreased from 47·8% in 1910 to 45·5% in 1920.

Commerce.—Boston's coastwise trade is important, the tonnage being much larger than that of its trans-Atlantic commerce. Boston is still second only to New York in export of meat and dairy products; and is the largest leather, wool, and fish market in the world. The port's foreign commerce is shown in the following tables:—

Vessels in Foreign Trade

	Entered:		Cleared:	
	Number	Net Tonnage	Number	Net Tonnage
1910	1,355	2,714,382	1,136	1,828,887
1915	1,488	2,463,651	1,161	1,659,802
1920	1,089	2,021,152	850	1,293,681

This shows a falling off in 10 years of: vessels entered 20 %; tonnage entered 26 %; vessels cleared 25 %; tonnage cleared 30 %.

Imports and Exports of Boston District

	Imports	Exports
1910	$129,006,184	$ 70,516,789
1915	152,653,791	107,475,677
1920	456,246,322	281,614,919

Manufactures.—The following table shows the value of products and of materials and the amount paid in wages in the years 1909, 1914 and 1918:—

Manufactures of Metropolitan Boston

Year	Value of Products	Value of Materials used	Wages paid
1909	$ 510,583,337	$284,354,062	$ 93,125,349
1914	584,115,582	323,455,579	107,139,932
1918	1,240,496,193	737,506,555	210,781,794

First in importance among manufactures is outer footwear $216,392,449 (leather boots and shoes $101,811,715, boot and shoe cut stock $70,105,251, and rubber boots and shoes $44,475,483). Next in importance are: slaughtering $98,047,504, machinery and foundry products $91,155,376, printing and publishing $51,193,923, men's and women's clothing $41,670,694, confectionery $37,988,668. These are the industries in which growth has been most rapid, but not rapid enough to overcome the slowing down as compared with other industrial centres. The increase in value of product due to the World War in the years 1914–8 was rapid, but did little more than keep pace with the increase in prices. The total increase in the number of persons thus employed from 1913, before the war, to 1918, the period of highest production under war pressure, was 40,235, following which, however, a large number of employees was laid off. With immigration of foreign workers, the constricted industrial opportunity has caused increasing numbers of native born to move away from Boston. The actual increases in population have been largely in the ranks of the immigrant peoples. 35 % of the inhabitants of municipal Boston being in 1915 foreign born (24 % of them Irish, 17 % Russian, 16 % Italian, 5 % English, 3 % German, 35 % all other nationalities). Of the municipal pop. in 1915, 72 % was wholly or in part of foreign parentage.

Railways.—During the 10 years 1910–20 the subway system was enlarged. The Boylston addition from Arlington to Kenmore street (1911–4) and the extension under the Common over the Charles river basin and underground in Cambridge to Harvard square (1914–8) developed a system 9 m. long, at a cost of $36,368,000. These new subways with the elevated system have given central clearance and ease of transfer throughout the district. The cities and towns have permitted several of their interurban lines to be abandoned. They have permitted many of their roads and streets to go into disrepair, but the motor transport service by private initiative has been greatly increased. The second transportation requirement—the need for equipment to keep in touch with outside markets—has not been met. Boston has failed to provide adequate terminal and storage facilities: and it is constricted in its railway service. There are three railway systems that look to Boston for clearance and outlet: the Boston & Maine, the Boston & Albany, and the New York, New Haven & Hartford. But the lack of facilities for transfer from one system to another makes Boston virtually three ports instead of one—competitors with each other instead of with outside ports. The cities to the north (as Lowell, Lawrence, etc., only a few miles from Boston) often find it of advantage to ship *via* New York. The same is true for freight originating on each of the three systems.

Education.—The public-school system is under state guidance and patronage (*see* MASSACHUSETTS). The growing interest in higher education is reflected in the table below. It is significant that

Boston University and the Massachusetts Institute of Technology, which have undertaken to provide technical and professional training to students who meet entrance requirements, have increased their student enrolment far more than any of the other institutions.

Registered Attendance at Chief Colleges and Universities.

	Harvard	M. I. T.	Simmons College	Boston College	Tufts	Boston Univ.	Radcliffe	Wellesley
1910–1	4,123	1,506	785	194	1,142	1,153	500	1,378
1915–6	5,226	1,900	1,083	487	1,541	1,984	683	1,512
1920–1	5,667	3,475	1,253	735	2,128	7,718	652	1,551
Incr.	37 %	131 %	60 %	279 %	86 %	570 %	30 %	13 %

The trend of higher education has been toward increasing opportunity for the masses. This is shown not alone by the increasing number of full-time college students, but also by the rapid growth in the number taking part time "University Extension Courses." In Harvard, for example, the number taking these courses increased 96 % from 1910 to 1920; in Boston University, 187 %; under the direction of the State Department of Education the number increased from 1,360 in 1916 to 24,231 in 1920, nearly one-half of these students being registered in metropolitan Boston. The estimated number for 1921 was 30,000.

Municipal Boston in 1920 had 264 permanent and 137 portable school houses, besides 21 rented quarters for schoolroom use; provided 130,669 school sittings; and employed 3,413 teachers; also 97 assembly halls and 15 drill halls and gymnasia It had 52 park and 32 schoolyard playgrounds; employed 153 recreation teachers, 46 school physicians, 48 school nurses, and 25 attendance officers. In 1919 it registered 122,452 regular day-school pupils; 8,260 in evening schools and 9,651 in continuation schools. The registration in normal, high and latin schools for the same year was 17,018. Of the pupils 82·6 % were in public schools, and 17·4 % in private schools.

Buildings, Libraries and Museums.—In 1910 the old Museum of Fine Arts was demolished and on the site was erected the Copley Plaza Hotel, built at a cost of $3,800,000 and opened in 1911. The new building of the Museum of Fine Arts, erected on Huntington Ave., was opened Nov. 15 1909, and a second section opened Feb. 3 1915, the total cost at that time being $3,000,000. To the State House east and west wings were added during 1914–9, at a cost approximating $3,000,000. John Sargent's series of panels in the public library was practically completed in 1916, when he added a third sequence, the "Theme of the Madonna." In Jan. 1919 the public library contained 1,197,498 volumes (922,348 in Jan. 1908). It continued to be the largest free circulating library in the world, with a circulation of 2,300,-732 for 1919 (1,529,111 for 1907). The New England Conservatory of Music remained the largest in the United States, having in 1919 3,700 students. The Boston Opera House was erected on Huntington Ave. in 1909.

History and Finance.—Boston, as a metropolitan district, has retained much of the institutional structure of the old towns which have grown together and become consolidated for certain purposes by legislation. Several things have happened in the 10 years 1910–20 indicating a drift toward political unification. What was called the "Boston 1915" movement resulted in better business leadership, in more ample support given to the chamber of commerce and other trade bodies; and legislation looking toward a unified harbour place. A new charter adopted in 1909 gave to the city a small council (9 members) elected "at large." In 1920, under the leadership of Mayor Peters, a first effort was made to consolidate the several independent cities and towns under a "Greater Boston" charter. In many ways the whole metropolitan district had developed the habit of acting together, as was exemplified in the Liberty Loan and Victory Loan drives, the results of which were as follows: First Liberty Loan $133,790,360; Second Liberty Loan $147,259,650; Third Liberty Loan, $77,202,500; Fourth Liberty Loan, $130,008,150; Victory Loan, $83,852,700; total amount subscribed $581,113,350.

Boston's *per capita* expenses continued to be the largest of any American city; but in the 10-year period ending in 1918 the net debt increased only 17·11 %. The average yearly expenditure for the five years ending in 1917 was $32,990,507, excluding payments on funded and floating debts. The running expenses *per capita* in 1917 were $31.68 (New York, $25.64; Chicago, $22.26). The Metropolitan Water Board, of whose expenditures Boston bears only a share, expended from 1900 to 1919 $22,463,201. The system has a capacity of 80,000,000,000 gallons. The city park system cost from 1899 to 1919 $1,954,738. The city debt in 1919 was $80,908,397 (gross debt $124,410,101); this included the debt of Suffolk county, which in 1919 was $1,435,335. The chief objects for which the city debt was created were in 1919: highways, $21,600,000; parks, $10,-750,000; drainage and sewers, $21,540,000; rapid transit, $36,340,-000. Boston paid in 1919 27·4 % of all state taxes, and about 32·65 % and 81 % respectively of the assessments for the metropolitan sewer, parks and water service. The city's tax valuation in 1919 was $1,528,153,778, of which only $198,863,678 represented personalty.

(F. A. Cl.)

BOTANY (*see* 4.299, with references on p. 302 to separate articles on botanical subjects).

I. *Introductory.*—Any attempt to record the progress of botanical science during the decade 1910–20 is made peculiarly difficult by the fact that specialization has rendered it impossible for any one person to keep abreast of all its manifold advances. In the following survey, the subject is accordingly treated in separate sections. Special reference, however, may be made here to the remarkable developments of applied botany which have been a feature of progress in England. The development of forestry (*see* Forestry) is now recognized as a function of the State and the Forestry Commission is actively engaged in schemes for the promotion of research. The Ministry of Agriculture, which had previously established a number of agricultural research stations, has not only been able to make provision by increased endowments for larger and more adequately remunerated staffs of investigators, but has also established two new stations of first importance. These stations, located together at Cambridge, are the seed testing station and the national institute of agricultural botany. The ultimate object which the former will achieve is increased agricultural production by an improvement in the quality of seed. The latter which owes its existence to the initiative of Sir Lawrence Weaver and to the financial assistance of the Ministry of Agriculture, the Development Commission and members of the agricultural industry, aims at increasing production by the carrying out of large scale tests of the trueness, cropping capacity and specific usefulness of plants of agricultural importance. To this end the station not only tests both existing and new varieties but provides for the working up of stocks of new and promising varieties on a scale sufficient to ensure adequate supplies for commercial use.

Scientific horticulture has also received a great impetus by the enlargement of the Royal Horticultural Society's experiment station at Wisley. Already the investigations conducted at the various experimental stations have led to results of great botanical importance. Of these may be mentioned the researches conducted at the John Innes Horticultural Institute on self-sterility of fruit trees, those at the East Malling and Long Ashton stations for research in fruit trees, problems which have resulted in an important advance in knowledge of fruit-tree stocks—a subject of equal botanical and horticultural importance.

The close association which has been established between the department of practical physiology and pathology at the Imperial College of Science, South Kensington, on the one hand, and the research stations at Rothamsted and East Malling, on the other, marks an advance in organization destined to have an important and beneficent influence on the progress of botanical knowledge; for as it is certain that progress in applied science must depend on the pioneer work of pure science, so is it no less certain that applied science quickly discovers problems which would otherwise long await the interest and attention of the worker in pure science.

(F. Ke.*)

II. *General Physiology.*—The most striking aspect of advance in plant physiology of recent years is the further development of the attempt to relate the fundamental activities of the cell with the colloidal nature of protoplasm. Protoplasm is considered to be of the nature of a hydrosol with protein and lipoid material, and possibly carbohydrate, as its disperse phase. It may, however, assume temporarily during life, or permanently at death, the condition of a gel, as is shown by the cessation of the

Brownian movement of the particles (*see* Bayliss, *Principles of General Physiology*, 1918). On the basis of the colloid nature of the plasma membrane many of the phenomena of cell permeability may be explained. On the colloid theory of protoplasm, the living organism has been defined as "a specific complex of dynamic changes occurring in a specific colloid substratum which is itself a product of such changes and which influences their course and character and is altered by them" (Child, *Senescence and Rejuvenescence*, 1915).

Further investigation of the fundamental process of carbondioxide assimilation has confirmed the work of F. F. Blackman and his school, which showed that the rate of the process is controlled mainly by temperature, light intensity and concentration of carbondioxide. Any one of these factors may control the rate of the process and so act as a "limiting factory." The amount of chlorophyll, since it controls to a large extent the amount of light absorbed, should also be a controlling factor, and Willstätter and Stoll (*Untersuchungen über die Assimilation der Kohlensäure*, 1918) have shown that this is so. With the help of the methods of extracting and estimating the leaf pigments developed earlier by Willstätter they have been able to relate chlorophyll content with rate of assimilation. Their observations have brought out the interesting fact of the importance of some unknown factor (possibly of enzymic nature) which may be termed the protoplasmic factor. The existence of this factor is demonstrated by the observation that, relative to the amount of chlorophyll it contains, the assimilating activity of a yellowing leaf may be many times that of a green leaf. The existence of some such factor is also demonstrated by the observations of Miss Irving (*Annals of Botany*, 24, 805, 1910) and Briggs (*Proc. Roy. Soc.* B., 91, 249, 1920), who demonstrated that during the greening of etiolated leaves chlorophyll appears some time before the process of assimilation begins. Osterhout (*Jour. General Physiol.*, 1919) and Warburg (*Biochem. Zeit.*, 100, 1919) have confirmed the high temperature coefficient of the process of carbon assimilation which was first demonstrated by Matthaei. This high temperature coefficient shows clearly that the process of carbon assimilation is not solely a photochemical process but is linked with one or more "dark" reactions. Warburg has also been able to show that light which was intermitted 16,000 times a minute—the light and dark periods being of equal length—caused as much assimilation as continuous light of the same intensity. Light received intermittently by the plant was thus twice as effective as that received during continuous illumination. Reference must also be made to a work of great value, Jörgensen and Stiles' critical review of investigations of carbon assimilation up to the year 1917 (Jörgensen and Stiles, *Carbon Assimilation*, 1917; originally published in the *New Phytologist*, 1916–7). An important method of estimating assimilatory activity under natural conditions by following the growth of the leaf area and of the dry weight of the whole plant was first used by Gregory (*Report Exper. & Res. Sta. Cheshunt*, 1918), and has been employed by Briggs, Kidd and West (*Annals of Applied Biology* VII., 1920). The permeability of the living cell is another aspect of plant physiology which has received much attention; but although many observers have studied the rate of entry or exit of substances, it cannot be said that great progress has been made in elucidating the mechanism of absorption, accumulation and translocation. Measurements of electrical conductivity have been largely used for estimating the rate of passage of electrolytes in or out of the cell, and methods based on the rate of deplasmolysis have also been employed. Stiles and Kidd (*Proc. Roy. Soc.* B., 90, 1919) using carrot slices and the conductivity method, have estimated carefully the rate of the entry of the cations and anions of a number of simple salts, the rate of entry being apparently related to the mobility of the ions. They have confirmed (using, however, a more satisfactory method) the work of Nathansohn on the balance between the concentration of salts inside and outside the cell. They show that with weak external solutions there is a very marked "heaping up" of material in the cell. For example, at equilibrium the concentration of potassium chloride in the cell may be 25 times that of the external solution. The mechanism of accumulation is obscure, but the equilibrium appears to follow the adsorption law. That marked and repeated changes of permeability can occur in the living cell has been shown by Osterhout (*Science*, 35, 1912; *Bot. Gazette*, 59, 1915; and other papers), who used the method of measuring the effect of various salts on the electrical resistance of a pile of discs of the thallus of *Laminaria*. The electrical resistance is taken as a measure of the permeability to ions of the plasma membranes. Increases of 50% and decreases of 20% in the resistance could be sustained repeatedly without injury. Lepeschkin and Tröndle have demonstrated that changes in permeability can be brought about by light, and so must be normal phenomena in the life of the cell; and Blackman and Paine (*Annals of Botany*, 32, 1918), using the electrical conductivity method for determining the rate of exosmosis of electrolytes from the pulvinus of *Mimosa*, have been able to follow the change continuously and have demonstrated that although light increases and darkness decreases permeability, yet the sudden change from light to darkness causes a sudden small increase of exosmosis which is soon, however, followed by a rapid decrease. The question of the meaning of the growth process and its analysis have engaged the attention of many workers on both the animal and vegetable side. Robertson especially has applied an autocatalytic equation to express the growth period of an ordinary organ, but as shown by Enriques it is only one of a number of possible equations. Mitscherlich (numerous papers from 1909 onwards in *Landw. Jahrb.*, *Land. Versuchs-Stat.*, etc.) has put forward an equation to express the relation of crop yield to external factors, based on the supposition that the increase of the deficient factor is effective in proportion to the departure of the yield from the maximum yield obtainable. V. H. Blackman (*Annals of Botany*, 33, 1919) has laid stress on the fact that the plant increases on the continuous compound interest principle, since with increase of leaf area its capacity for assimilation increases, and this leads to a still further increase in the rate of assimilation. The rate at which dry material is added, assuming it to be added continuously, is termed the "efficiency index."

J. C. Bose has continued his investigations of the growth and irritability of plants (*Researches on Irritability of Plants*, 1913, and *Transactions of the Bose Institute*, 1918). He has devised a special instrument, the high magnification Crescograph, by means of which the elongation of plant organs can be magnified more than a million times. By this instrument not only can very minute contractions and expansions be observed but also changes which occur in as short a time as a fraction of a second. Bose has also investigated in great detail the various electrical responses to stimulation which plants exhibit. He has shown, for example, that when a stem which contains movable starch grains in its endodermis is placed horizontal, a marked difference of potential is to be observed between some neutral point (such as a leaf) and the interior of the stem. It was further demonstrated by the use of a probe, in the form of a fine insulated platinum point which could be forced into the tissue of the stem, that the difference of potential developed is highest when the point of the probe is in contact with the endodermis of one side of the stem, falls to a minimum when the probe reaches the centre of the stem, and rises again to a maximum (but with the direction reversed) when the probe reaches the endodermis at the other side of the stem. These observations provide additional evidence of the part played by the statoliths of the endodermis in the geotropic response.

In the field of irritability the most important new point of view put forward is that of Blaauw (*Med. Landouw.*, Wageningen, 15, 91, 1919) on the nature of the phototropic reaction. This investigator first concentrated his attention on the effect of light as such, apart from light direction. He made a very careful series of experiments with the sporangiophore of *Pilobolus* and the hypocotyl of *Helianthus*. By an ingenious arrangement of mirrors the plant was illuminated *equally all round* with electric light of various intensities. The rate of growth was measured every few minutes, and thus it was determined that the "light growth reaction," as Blaauw terms it, is a very complex effect. With continuous light *Phycomyces* shows a latent period of 3–9 min., and then the rate of growth begins to rise, reaching in 7–10 min. a maximum increase of 41–74%. The increase is followed by a fall and then several rises and falls follow, the normal rate of growth being finally reached, except with very high intensities. A similar result is obtained with *Helianthus*, but the main effect is a reduction of growth instead of an increase as in *Phycomyces*. Blaauw explains phototropic effects as quite independent of light direction, holding that they are really due to the different intensity of the illumination of the two sides—as de Candolle maintained long ago. The fact that both *Phycomyces* and *Helianthus* show a positive phototropic reaction while the light growth reactions of the two are opposite in nature, is explained by the lens-like action of the glassy sporangiophore, which causes a higher light intensity on the further side. Buder confirmed this explanation for he has shown that by placing the sporangiophores in paraffin oil, which abolishes the lens action, the response is reversed. The root of *Sinapis alba* shows a negative light growth reaction and negative phototropism, but here again, owing to the shape of the apex, the side away from the light is the more highly illuminated. Blaauw claims that plants have no mechanism for the perception of light direction, and that there is no such thing as a real phototropic reaction, but only a light growth reaction. (V. H. B.)

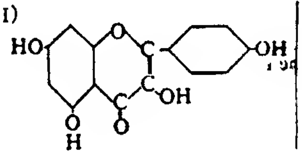
III. *Chemistry of the Sap Pigments of Plants.*—Flowers derive their tints from two very different classes of coloured compounds, termed plastid and sap pigments respectively. The former include chlorophyll, carrotin, xanthophyll and allied compounds, and are not soluble in water. Chlorophyll rarely enters into flower colourings, but compounds of the carrotin and xanthophyll group are responsible for most of the bright yellow and orange flower colours, whilst in the presence of anthocyans they yield browns, bronzes, etc.

The sap pigments are water-soluble glucosides, and may in the main be subdivided into two groups. One group, the flavone and flavonol colours, contains compounds which, though usually present in the cell sap of flowers, rarely give rise to colour effects as they are

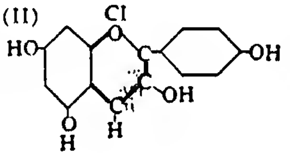
pale yellow or colourless unless in the form of alkali salts. In certain cases a fraction of a % of a carrotin colour may cover completely more than 20 % of a flavonol colour. The researches of A. G. Perkin and others have resulted in the isolation and examination of a large number of the members of this group, whilst the investigations of Kostanecki have led to their synthetic preparation.

Colours of the second group of sap pigments are called anthocyans, (the glucosides being termed anthocyanins; the non-glucosides, anthocyanidins). They give rise to the red, purple and blue colours in flowers, and owing to their brilliant effects, have long been the subject of speculation and research. It is only recently however, that their chemical nature has been disclosed. Willstätter and Everest obtained the pigment of the cornflower in a pure state, and proved that it exists in the flowers as a glucoside. They also showed that by change in the condition of the cell sap one pigment may produce red, purple or blue colours: red in the presence of an acid cell sap, purple if the sap be neutral and blue if it contain the pigment in the form of an alkali salt. Indeed the same pigment (cyanin) has been isolated from red roses and from the blue cornflower. These observations have been extended by Willstätter and Mallison to show how when the presence of pigments of the other groups is allowed for, all variations of flower colours can be explained. Shihati, Shibati and Kasiwagi have recently put forward alternative suggestions to account for flower colours, but much of their experimental evidence has been shown by Everest to be untrustworthy. Other chemical work by Willstätter and by Everest has elucidated the chemical structure of anthocyan pigments, has shown that they are products of the reduction of the flavonols, and has led to their synthesis. The accompanying formulae show how closely anthocyan pigments are related to the yellow flavonol compounds. (I.) represents kaempferol, a flavonol isolated by A. G. Perkin from a species of larkspur, and (II.) represents pelargonidin, which is the anthocyan pigment present in the flowers of various species of pelargonium.

(I)



(II)



A considerable number of these pigments has now been isolated in a pure condition. It is interesting to note that the honour of having first prepared crystals of these pigments outside the plants falls to the botanist H. Molisch. Both in the yellow sap pigments and in the anthocyans, the individual pigments only differ from other pigments of their own group in the number and position in the molecule of OH, methoxy, or sugar groups.

Before the relationship between flavonol and anthocyan pigments had been demonstrated by chemical means, much botanical work had been carried out on this problem, notably by Wheldale and by Keeble, Armstrong and Jones. These investigations confirmed views expressed many years previously that there was some definite connexion between the yellow sap pigments and the anthocyans. They also led to the belief that the anthocyan pigments were formed from flavonols. This belief has been greatly strengthened by the proof of the close chemical relationship that exists between the two groups of pigments, and by the work of Everest, Willstätter and Combes, which proved that flavonols could readily be converted into anthocyans. Moreover Everest has shown that in all probability the anthocyan present in the Black Knight viola is accompanied by the flavonol pigment from which it would be produced by reduction.

A number of flavonol compounds has been found to exist in plants in the sugar free condition, but thus far only one anthocyan has been definitely proved to exist in nature in the non-glucoside form—that occurring in black grapes.

It is of interest to mention that whilst many of the yellow sap pigments have long been used as mordant colours for commercial dyeing processes, and are so still used to some extent in Europe and more in the East, the beautiful anthocyan pigments also have well marked tinctorial properties and yield fine shades on tannin mordants. In the non-glucoside condition they have affinity for metallic mordants, but owing to their lack of fastness in washing their use to any large extent is commercially impracticable.

Beyond the two main groups mentioned above, sap pigments exist which differ in constitution from the members of the main groups. Doubtless the number of these will increase as investigations proceed. An interesting case is that of the pigment of the "Red Pea Gall" recently investigated by Nierenstein.

For reference to the literature see M. W. Onslow, *Practical Plant Biochemistry* (1920); M. Wheldale, *The Anthocyanin Pigments of Plants* (1915); A. G. Perkin & A. E. Soc.* B. vol. 92, p. 150 (1921); Everest, *Jnl. Soc. Dyers & Colourists*, vol. 34, p. 47 (1920); M. Nierenstein, *Jnl. Chem. Soc.*, vol. 115, p. 1328 (1919). (A. E. Ev.)

IV. *Mycology.*—The recognition of the primary importance of the physiological point of view as compared with the older morphological (or systematic) point of view was prominent as the inspiration of perhaps the most important work in plant pathology during the period 1910–20. In England the brilliant work of Blackman and his school laid the foundations for a scientific knowledge of the physiology of infection by parasitic fungi. These studies have been concerned with *Botrytis* (Blackman and Welsford, 1916); (Brown, 1915–17); *Colletotrichum* (Dey, 1919) and *Synchytrium endobioticum* (Curtis, 1920).

The study of specialized or adaptive parasitism has been followed with fruitful results. The validity of the conception of "bridging species"—involving as it does a certain physiological plasticity of the fungus—which was accepted by Marshall Ward and Salmon, has been alternately affirmed and denied. Pole-Evans (1911) has asserted that a rust when growing on the susceptible F_1 hybrids may thereby become capable of infecting the immune parent used in the cross; Freeman and Johnson (1911) have stated that barley acts as a "bridging species" for biologic forms of *Puccinia graminis* on other cereals. On the other hand, the number of investigators is increasing who, working with isolated strains of the parasitic fungus under rigidly controlled conditions, have found no evidence for the existence of "bridging hosts." The admirably systematized and patient researches of a band of workers in America, headed by Stakman, seemed destined to solve this most important question of the constancy, or plasticity, of the "biologic form." The complexity of the problem may be gauged by the fact that a considerable number (at least 22) of "biologic forms" of *P. graminis* on wheat have now been discovered—a fact explaining why the same variety of wheat may be immune in one locality and susceptible in another (Stakman, Piemeisel, Levine and Leach, 1917, 1919).

Specialized parasitism has been studied also by Barrus (1918), who has found *local* "biologic forms" of *Colletotrichum lindemuthianum;* by Reed (1912–8) and Vavilov (1913) in the *Erysiphaceae* and by Fischer (1912–7) in the *Uredineae.* In England Wormald (1919), investigating the "brown rot" (*Sclerotinia*) diseases, has discovered the existence of two "biologic forms" in *S. cinerea*, of which one, capable of causing a blossom wilt and canker disease of the apple, is characterized by a more abundant secretion of oxidase. Brierley (1919–20) working with single spore cultures of strains from a "mixed population" of *Botrytis cinerea* has shown that their phenotypic characters are modifiable but are specific in relation to constant factors.

As illustrating the physiological bent of many important researches that have been made, the following may be mentioned:—the relation of soil temperatures to root infection (Jones and Gilman, 1914–6); (Tisdale, 1916–7); (Edson and Shapovalov, 1920); relations of temperature and humidity to infection by certain fungi (Lauritzen, 1919); (Brooks and Cooley, 1917); relations of some rusts to the physiology of their hosts (Mains, 1916); chemical changes produced in host tissues (Hawkins, 1916), (Rose, 1915); relations between climate and disease (Stevens, 1917); influence of soil conditions on *Thielavia* (Johnson, 1919) and *Pseudomonas citri* (Lee and Fulton, 1920); physiological studies on spinach showing "Mosaic" disease (True *et al.*, 1918); effect of the "black rot" fungus on the chemical composition of the apple (Culpepper *et al.*, 1916).

The bionomics of "potato blight" (*Phytophthora infestans*) have been much studied. The investigations of Melhus (1915) and Pethybridge (1911) have thrown light on the nature of the primary seasonal outbreaks; Clinton (1911) made the notable discovery that oospores are formed by the fungus when grown on a certain artificial medium—a fact confirmed by Pethybridge and Murphy (1913). Eriksson (1917–8) has stated that "mycoplasm" and non-resting oospores occur in "blight-infected" potato leaves; since, however, this observer now sees "mycoplasm" in so many directions (rust on cereals, rust on hollyhock (1911), mildew on the gooseberry) independent confirmation of its existence in at least one of the cases is necessary before the "mycoplasm" hypothesis can be accepted. Evidence in marked opposition to Eriksson's statements as to the primary outbreaks of hollyhock rust has been published by Bailey (1920).

From the study of bacterial diseases of plants, no previous period of ten years had seen the collection of so rich a harvest of facts. The indefatigable work of Erwin F. Smith constitutes by itself an invaluable library of exact information. In his researches (1912–20) with *Bacterium tumefaciens*, the organism causing "Crown gall" in plants, proof has been obtained that the gall formed at the point of infection gives rise to tumour strands which push their way through the surrounding tissues and develop secondary and tertiary growths, analogous to what is found in animal sarcoma, carcinoma and embryoma. Numerous other workers, *e.g.* Morse (1917) in the United States, Doidge (1915–9) in South Africa, and Paine

(1917–9) in England, have been rapidly adding to our knowledge of this group of parasites.

Among the notable outbreaks of plant diseases which have occurred are the American gooseberry mildew (*Sphaerotheca mors-uvae*) originally introduced from America and now fixed past all eradication in the fruit-growing countries of Europe; the terrible "wart disease" of the potato (*Synchytrium endobioticum*) neglected in the early days of its appearance in Great Britain and now firmly entrenched in the Midlands, in Wales, in the seed-growing districts of Scotland and sporadically elsewhere in England, reaching in 1920 to the great potato-growing county of Lincolnshire. On the Continent it has appeared in Hungary, Holland, Sweden, Germany etc. Such is the virulence of this potato disease that in infested soil potato growing becomes impossible unless recourse is had to an immune variety. The disease has been made the subject of much international legislation, affecting export trade. In 1918 it appeared in the United States in miners' gardens among the coal-fields of Pennsylvania; a strict quarantine has been established round the infested regions, and a publicity campaign has been started in America with an organization and vitality unknown in Europe, the results of which later years will reveal. In South Africa, Australia and America the Citrus canker (*Pseudomonas citri*), originally introduced on a plant from Japan, has swept through the citrus plantations with devastating results. In South Africa the canker eradication campaign up to 1919 had cost over £60,000. In the United States the white pine Blister Rust (*Cronartium ribicola*), which was introduced into America from Europe about 1892, continued to make steady progress in the white pine regions of the eastern and north-eastern states, notwithstanding that for several years a coördinated campaign by the State and agricultural organizations had been in progress, under which "scouts" and "State eradication crews" destroyed wholesale the species of *Ribes* which constitute the alternate host of this heteroecious Rust. In one survey of an area of 72 sq. m. in New Hampshire, one-fourth of the pines was found to be infected. The Chestnut Bark disease (*Endothia parasitica*), which appeared in 1904 in a park in New York, increased to such an extent that by 1921 losses of hundreds of millions of dollars had already been caused and it threatened to destroy every chestnut wood in North America. This disease, probably introduced from Japan, girdles and kills the chestnut tree; its spores are distributed from tree to tree by the wind, insects and birds.

Renewed warfare (reminiscent of the Massachusetts Barberry law of 1755 and the similar law in Denmark in 1903) has been declared in the United States against the barberry. In 1916 it was estimated that Black Rust (*Puccinia graminis*) on wheat caused a loss of nearly 200 million dollars in the United States. This Rust is heteroecious and field observations in the States have shown that the aecidiospores from the barberry start, in the spring, epidemic outbreaks of Rust on wheat.

Another group of diseases which excites alarm in the United States and also in Europe is the "Mosaic" diseases or "infectious chlorosis." A prominent American pathologist has said of this class of diseases that "it gives one the creeps," so obscure is the cause, so infectious is it and so increasingly prevalent on a rapidly increasing number of host plants (potato, tomato, tobacco, cucumber, spinach, bean, red clover, sugar-cane, maize, grasses). The investigations of a band of workers, among whom may be mentioned Allard (1914–8), Brandes (1920), Dolittle (1920), Schultz *et al.* (1919), appear to show that the cause of these menacing diseases is an ultramicroscopic organism, rather than an enzyme as previously supposed. On some plants the disease is freely transmitted by certain sucking insects, such as *Aphides*. In Europe the chief example is the disease of the potato called "Leaf curl," the subject of important investigations by Appel (1911) (1915), Quanjer (1913–20), Doby (1911–5), Artschwager (1918), Neger (1919) and Murphy and Wortley.

The decade ending in 1920 was rich in investigations bearing on the scientific control of plant diseases. Stimulated by the now classic discovery made by Biffen in 1907, that the inheritance of Rust resistance follows on Mendelian lines, workers in genetics (*see* Genetics) in many countries, *e.g.* Nilsson-Ehle, Biffen, Pole-Evans, Stakman, Parker and Piemeisel, and Hayes, Parker and Kurtzweill, have been engaged in the breeding of disease-resistant plants. It has been shown that resistance and susceptibility to Rust can hardly be considered as simple characters, the F_2 results giving evidence in favour of the multiple factor hypothesis. Immunity from, or resistance to, many different types of fungous diseases has been sought for and found, either by selection or cross breeding, in many genera of economic plants. Varieties of beans and sugar-cane immune to "Mosaic disease" have been discovered (Reddick and Stewart, 1919); Earle (1919); beans immune to *Colletotrichum*, found by Barrus (1915) and used in cross breeding by Burkholder (1919) and McRostie (1919); asparagus resistant to Rust (Norton, 1913), resistance to citrus canker (Peltier, 1918); wilt (*Fusarium*)—resistant cottons, tomatoes, cabbages and flax (Orton); potatoes, English, German and American varieties, immune to "wart disease" (Malthouse, Snell *et al.*); Werth (1919), Marlatt (1919); potatoes immune to "blight" (Salaman, 1910); cereals immune to *Erysiphe Graminis* (Vavilov, 1913), Reed; hops immune to *Sphaerotheca Humuli* (Salmon, 1917–20).

Of great importance, economically, has been the scientific study of fungicides. The great work of Pickering (1907–12) in elucidating the chemistry of "Bordeaux mixture" profoundly affected the method of making copper-containing washes. Additional knowledge has been gained by the researches of Sicard (1914) and Vermorel and Dantony (1914) in France, Ewert (1912) and Wöber (1919) in Germany, Mond and Haberlein (1919) in England, and Butler (1914–20) in America. Gimingham and Barker (1911–14) showed that a biological rather than a chemical explanation holds good for the efficacy of copper-containing fungicides on the sprayed plant.

A notable advance, accelerated in many countries by wartime organizations, has been made in the legislative control of plant diseases by the State. In most countries the grower is now required by law to notify the outbreak of certain infectious diseases of plants. In Great Britain "wart disease" of the potato (*Synchytrium endobioticum*) has been the subject of numerous legislative orders, whereby the sale of "seed" potatoes, and their import and export, are controlled, and the grower prohibited from growing susceptible varieties of potatoes in affected districts. On the other hand, the State, by a system of inspection, guarantees the purity of stocks of immune varieties. Other recent examples of legislation against fungi in England are the "Silver leaf" order of 1919 and the Onion Smut order of 1920. The former was introduced to try to save the "Victoria" plum and other valuable plums from being exterminated by the "Silver leaf" disease, now definitely known, through the work of Percival and of Brooks (1911–9), to be caused by the fungus *Stereum purpureum*. The grower is now required by law to burn the dead tree—or the dead wood of the tree—on which the *Stereum* fructifications are formed. This order, however, is administered as an educational rather than as a punitive measure. The United States, in their efforts to stop the importation from Europe of new fungous pests, passed in 1912 a "Plant Quarantine Act," under the provisions of which the importation of all five-leaved species of Pinus from Europe and Asia was prohibited, for fear of their carrying the white pine Blister Rust; also, potatoes coming from many European countries were excluded in fear of "Wart disease." Later legislation has prohibited altogether the importation of plants into the United States except under special licences. In this step South Africa has followed. In the United States, an Act to prevent fraud in the sale of fungicides and insecticides is in force, and in England, where during the World War the purity of copper sulphate for spraying was legally guaranteed, further legislation to secure the purity of lime sulphur and arsenical washes has been contemplated. Legislative measures against plant diseases commonly affect international interests, and the first of what were planned as regular international Phytopathological Conferences (interrupted, however, by the World War) was held at Rome in 1914. A Convention was signed at Rome by the delegates of some 30 states pledging themselves not only to maintain an official phytopathological service for the detection and suppression of certain diseases, but also to maintain institutes for scientific research, so that state officers may be supplied with the best technical advice. Another branch of state activity is seen in the surveys of plant diseases which are being made in many countries. The "Report" (1918) of the American plant pathologists, compiled by Lyman and others, is a document of absorbing botanical and economic interest, and from it can be gathered a good idea of the wide development of extension work with field laboratories and of "team work" in research now existing in the United States. Similar organization for plant disease surveys exists also in Germany (Appel, 1914). The Annual Reports of the Plant Diseases Branch of the Ministry of Agriculture in England, and the similar reports issued in France, Holland and other European countries, as also in India and our Colonies, are forming the basis for a world-wide census of plant diseases, the necessity for which has been so ably put forward by Sorauer and Eriksson in Europe, by Butler in India and by the leading American plant pathologists. (E. S. Sa.)

V. *Soil Sterilization.*—Intensification of culture leads always to an increase in the soil flora and fauna, and among the forms that assume importance are many that are directly or indirectly harmful to plants.

It has been found that a simplification of the soil population leads to increased productiveness and greater healthiness of crop. This simplification can be brought about by mild killing agents which are not too drastic in their effect—which will kill living germs, but not all spores.

Steam heat is the most effective agent: it is so effective that it would always be adopted if questions of cost and convenience never arose. It not only kills animal pests, ova and larvae of eelworms, wireworms, woodlice, etc., and reduces fungi, but it also brings about a certain amount of useful soil decomposition, thus greatly facilitating the work of the food-producing organisms of the soil. Steam heat is used in two ways in the glasshouses of the Lea Valley in England: in one the soil is dug over, then covered with a large wooden tray under which steam is blown

for about an hour; in the other the soil is trenched in the usual way, but at the bottom of the trench is placed a grid made of iron piping perforated with holes through which steam is blown as soon as the soil has been replaced. The grid is then pulled out and placed in the next trench. The cost before the war was not less than £24 per acre, and in 1921 it varied according to the thoroughness of the steaming from about £90 to £300 per acre. In small nurseries or private glasshouses baking the soil is usually effective and is much cheaper, a coke oven being worked at very little cost. There is, however, a limit below which the cost cannot be brought, and in practice 12 tons or more of coke are needed to steam an acre of soil.

Attempts have therefore been made to find some chemical agent that will prove as effective as heat in dealing with undesirable organisms.

The method of investigation is to take each organism and find the toxicity of various chemical groupings. An example is as follows:—

Amount required to kill Wireworms.
(Gram molecular weights.)

Basal Substance	Added Group	One Group	Two Groups
Benzene 100	Methyl	54	30
	Chlorine	26	8
	Bromine	14	—
	Iodine	6	—
	Amide	3·5	Non-toxic
	Nitro	3	Non-toxic
	Hydroxyl	1·4	·
	Chlormethylene	0·5	—

Proceeding in this way it is found that chlorcresol and dichlorcresol are very effective, and they are being studied on a large scale. Some complications arise from the fact that soil bacteria have remarkable powers of decomposing many poisonous substances such as carbolic acid, cresol, naphthalene, etc., and in some cases the decomposition proceeds so rapidly that the substance disappears before it has had proper time to act. This difficulty is being met by the introduction of stabilizing groups.

VI. *Ecology.*—In the domain of ecology the most important work since 1910 has been the intensive study of the habitat conditions in a number of limited areas. It is on such data alone that broad generalizations can be safely based, but much more needs to be accomplished in this direction before the significance of the results obtained can be rightly estimated. Of these intensive studies it is possible here to indicate only a few. Of the numerous types of plant communities that have been investigated, forests and woodlands have received a large share of attention and well illustrate the chief lines of progress.

Descriptive or primary survey work has elucidated interesting points respecting the courses of the altitudinal and polar tree limits. The meteorological conditions above and immediately below the timber line have been shown to exhibit an abrupt change associated with the cessation of shelter, but the gradual upward extension of the tree zone is limited by climatic conditions of which the duration of the snow-free period is an important factor. Both in America and Switzerland a rise of the timber line has been noted on the larger mountain masses and, as Brockmann-Jerosch has pointed out, the polar tree limit approaches the poles on the great continental land masses whilst it recedes from them in the oceanic regions of high latitudes. In other words, a continental climate is favourable to tree growth whilst an oceanic climate is unfavourable except at low latitudes. Modifications of the altitudinal timber limit by soil and aspect have brought out the different demands and tolerations of individual species. As a consequence of such changes the successive timber zones rise to a higher altitude on south exposures and on dry warm soils whilst on north aspects not only are the zones lower but they may also be more numerous. In Switzerland, for example, successive zones of chestnut, beech and larch occur on slopes facing southwards whilst on northern slopes zones of silver fir and spruce become interpolated, the lower limit of the latter being apparently determined by the diminishing rainfall. The study of the biology and physiology of the constituent forest species has served to demonstrate the adaptational character of many of their different features. The periodicity of the herbaceous vegetation is, for example, intimately related to that of the shrubs and trees above, the assimilation of the more specialized members of the former being chiefly carried on before the canopy of the latter is complete.

Again, it has been shown that the optimum assimilation of such plants takes place in relatively weak illumination whilst their osmotic pressure, as in the plants of other habitats, is intimately related to the humidity of the environment. This has been shown to obtain in the case of some prairie species; even for the different parts of the same individual and in the different seasons of the year. Investigations of the soil conditions in relation to the plant covering have yielded promising results. Thus, the distribution of natural vegetation seems to be largely associated with changes in such factors as acidity, water content, humus content and proportion of bases. The study of the first named has received a great impetus during the past few years, and in Sweden Hessellman has shown that the absence of natural regeneration in many forests is connected with high acidity and deficiency of nitrates.

Another aspect of vegetation is the change to be observed when the environment is altered or the original plant covering removed. The investigation of such succession phenomena has already yielded important economic results in relation to the improvement of pasture. The work of W. G. Smith in Scotland, of Dr. L. Cockayne in New Zealand and Prof. J. W. Bews in South Africa has drawn attention to the possibilities of artificial control of the natural succession. This principle is capable of wide-spread application wherever natural vegetation has an economic value; but it demands as a preliminary an intensive knowledge of the ecology of the individual species. It is as an outcome of such knowledge that Oliver has suggested the use of the plastic plant in place of groynes in fore-shore control.

On the philosophical side of the subject more has been written than the present state of our knowledge or its usefulness warrants. An extensive literature has developed on the classification of plant communities but most of these centre around one or other of four main view-points. The first emphasizes the importance of soil conditions as the basis of classification and is exemplified by the system proposed by Gola in 1910 based on his theory of osmotic edaphism. The second lays most stress on the physiognomy of the constituents of plant communities and with this are associated the names of Brockmann-Jerosch, Gams, Raunkiaer, Rubel and Warming. The third, associated with the American school, lays especial stress on succession, and Clements, who has done most to develop this view, classifies plant associations according to the climatic climax of which they represent phases of development. The fourth regards floristic composition as of paramount importance and has been upheld by Braun-Blanquet, Du Rietz, etc.

The first two and the last tend to result in systems that are too artificial, whilst that of Clements demands a knowledge that we often do not possess and tends to segregate phases which, though developing along divergent lines, are, regarded as plant communities, more closely related to one another than to the other phases of the same succession. Ecology is in much the same position as taxonomy in the early days when systems were frankly artificial because of the inadequacy of the knowledge to establish a natural system. Doubtless in time we shall find that, as with plant groups, different sets of characters must be used for different communities, but, in the meantime, these systems, however deficient, have served as an inspiration for valuable research which is yielding that knowledge on which the classifications of the future must be based.

References.—The chief literature prior to 1907 is cited by Flahault (*Progressus Rei Botanicae*, 1907), whilst for the literature subsequent to 1913 reference should be made to the *Journal of Ecology* (1913 *et seq.*) and *Ecology* (1918 *et seq.*), the respective organs of the British and American ecological societies. VII. *Horticultural Exploration.*—Botanical exploration in relation to horticulture centred during 1910-20, as in the preceding decade, in S.-E. Asia, particularly in western China. The gradual acquisition from all parts of the world of species new to cultivation has proceeded on a steady course, but the novelties from the East so far surpass in number, and in some

ways in interest, those from other regions as to warrant our speaking of this Chinese invasion as the dominant feature of plant introduction since the opening of the 20th century.

Explorers have discovered the richest relic of the Palaearctic flora, its richness conditioned by an unique assemblage of deeply riven, snow-clad mountain ranges traversed by three mighty rivers —Salween, Mekong, Yangtse—of parallel course north to south separated by narrow divides, also deeply incised, across the monsoon trend. A paradise of species in the making! The first exploration with declared horticultural aims, tempted by records of the finds of French missionaries and Henry's wonderful Ichang collections, was that of Wilson, in 1899, who made Western Hupeh and Szechwan his field of work during the succeeding 14 years, later passing eastwards to Korea and Formosa. He was followed in 1904 by Forrest —still exploring—who took Yunnan and adjacent Tibet and N.-E. Burma for his sphere. Through these pioneers thousands of new species have come to our ken. Later explorers who have affected horticulture have been Purdom in Kansu, Kingdon Ward—still exploring—in the same area as Forrest, Farrer in Kansu and, later with Cox, in N.-E. Upper Burma. Among the horticultural prizes and the plants of economic value that have come to us through these explorations in the shape of shrubs and trees, there are some two to three hundred new species of rhododendron alone, and amongst herbaceous plants primula gives us far over a hundred novelties. Genera—to name a few—that are prominent in the number of new species of shrubs and trees, indicating clearly the nature of the flora and the plants added to cultivation, are: acer, alnus, berberis, betula, buddleia, carpinus, clematis, cornus, corylus, cotoneaster, crataegus, deutzia, euonymus, fraxinus, hydrangea, ilex, ligustrum, litsea, lonicera, magnolia, photinia, pieris, populus, prunus, pyrus, quercus, rhododendron, rosa, rubus, salix, smilax, spiraea, styrax, syringa, tilia, vaccinium, viburnum, vitis; of conifers, abies, keteleeria, picea, pinus, tsuga. Similarly amongst herbaceous plants some of the noteworthy genera are: aconitum, adenophora, allium, androsace, anemone, aster, codonopsis, corydalis, cremanthodium, cyananthum, delphinium, didissandra, dracocephalum, gentiana, impatiens, iris, lilium, lysimachia, meconopsis, nomocharis, oreocharis, pedicularis, pleione, polygonum, potentilla, primula, rheum, roscoea, saxifraga, sedum, senecio, silene, trollius, thalictrum.

To the west of this partially explored region lies a vast area unexplored extending to Bhutan, whence, ere long, riches, perhaps in diminishing amount, will be gathered. Cooper at the Himalayan end of this area has done splendid exploration work over Griffith's ground in Bhutan and further east, enriching horticulture with many good plants.

Apart from the new species which these explorations have brought to horticulture, two biological problems of horticultural interest are touched especially by the work of Forrest. One is raised by the modification of form observed in the direction of specific differentiation exhibited by single phyla in relation to the multiplicity of environmental conditions offered by the exceptional physical construction of the region. It suggests possible results—positive or negative—bearing upon evolution through correlation of plants in nature with similar forms in cultivation. The other—that of humus plants growing on limestone—immediately concerns horticulture in view of the fact that rhododendron, for instance, cannot be grown in cultivation upon a limestone soil. That so many of the rhododendrons collected by Forrest have their leaves densely covered by a penetrating mycelium makes the suggestion admissible that the fungus of mycorrhiza has migrated from the uncongenial lime-soil environment to the leaf to function there—forming a mycophyllon—as a nitrogen-adjuvant. The following-up of these discoveries is for the future. (I. B. B.)

VIII. *General Morphology.*—The wider problems of the origin of plant life on this world, its relation to animal organism, and above all the evolutionary progression of the flora of the land surface, have claimed the attention of successive generations of botanists. The older deductions of the Hofmeister school were admirably and lucidly summed up and amplified by Bower (1908) in *The Origin of a Land-Flora*, and this book has so held its own as a text-book that there has been little to add to it. In a posthumous volume Arber (1920, *Devonian Floras*) attempted even to visualize the actual geological epoch at which the transition took place from archaic aquatic algae to the first types of land-vegetation, as expressed in the change from a Lower Devonian flora of Thallophytes to the Upper Devonian of Archaeopteridae. Apart from the intensive investigation of the vestigial races of Pteridophyta of the present day, or of the recent debris of Palaeozoic times, it is possible to approach the subject indirectly, and to state the nature of the problems to be solved from the new view-points opened up in connexion with the earlier phases of plant life on the world surface by the consideration of conditions of life in the sea.

Since early papers by Luther (1899) and Bohlin (1901) on the relation of the reproductive cells of fresh-water algae to flagellates, the Flagellar theory has entered on a new phase to the extent that it is now freely accepted that all phyla of plant-life, as also all animals, must be based on a flagellate ancestry: that motile reproductive cells have not been evolved specially for the reproductive purposes which they serve, but indicate the retention of an older phase of aquatic existence. To this may be added the recognition by protistologists (Doflein, 1916) of the fact that the autotrophic (plant) flagellate must be regarded as the precursor of all heterotrophic and animal flagellate phyla: while the vast variety of marine organism in which the flagellated phase is still dominant or readily regained in reproductive stages implies that it is to the pelagic flagellates that one must look for conceptions of the origin of higher organism, rather than to the Amoeba of fresh water or sea bottom. As shown by Pascher (1917), the amoeboid habit may be attained secondarily, in connexion with available substratum, in any line of elementary flagellate evolution. In this way the conclusion appears inevitable, not only that life as we know it arose in the sea, but from the material of sea water, as the physico-chemical constitution of protoplasm suggests at the present day. Since no other factors but those of pelagic water and solar radiation are required to determine the physiological and structural response of such living zoids, a phase of continuous deep water over the entire world surface must have obtained to give rise to such "plankton" organism. The cell-unit, of which all higher life is composed, thus represents the soma attained in such an environment, established for all time with nuclear mechanism and faculty for division and fusion, as also all plasmic functions and assets inherited as the cell equipment of plant and animal organization.

It is to the sea that one must look for the incipient syntheses of early life, and the introduction of land or sea bottom within the photic zone will lead to the progression of attached organism (hormon) which responds to the more elaborate factors of water plus substratum. With the assumption of a sessile habit on the part of originally free zoids of the plankton, the attached plant or animal proceeds to a benthic phase of existence, and in the case of autotrophic zoids it begins to be possible to define the scope of algology. The cell soma becomes enlarged and multiple as it successfully solves the problem of increased nutrition by a surface area exposed to a medium which is constantly renewed so long as the capacity for attachment is unimpaired. As opposed to the successful detachment of predatory animal organism (nekton), the detached autotrophic plant fails from impoverished nutrition. The development of the algal soma thus follows the infinite series of compromises between maximum surface for nutrition and minimum exposure to mechanical strain, from quiet dark levels to illumined surface-zones of rough water, giving rise to morphological differentiation of branching axes, growing points, laminar extension, and ultimately to massive highly differentiated shoot-systems with ramuli subserving attachment which come within the more popular connotation of plant-form. In all such cases, however, exigencies of racial continuation imply a resumption at some period of the older plankton-soma, and in this phase phenomena of sexual fusion may be maintained; to attain a more complex differentiation (sex-distinction) as the wastage of protoplasts in regaining the sessile condition, on a substratum increasingly occupied in a violently agitated medium, may be brought under control. The development of algal form and volume commonly runs parallel with increasing specialization of sexual and asexual reproductive mechanism. The latter implies that a cytological alternation may be requisite in the life cycle. Highly specialized growth-forms of the benthic soma of autotrophic plants parallel the equally advancing benthic somata of holozoic nutrition (sponges, hydroids); and in both very comparable differentiations of sexual cells, sexual organs, and the retention, at any rate on the part of the male gamete, of the older flagellated soma illustrate the parallelism of the biological problems.

From such highly organized somata of the sea the flora of the land takes origin, both as compulsory transmigrants on the first exposed land-surfaces, and as left residual in water now renewed by atmospheric precipitations as "fresh," and devoid of much of the essential food salts. Starvation in fresh water and desiccation on dry land become the determining factors of all advancing land-vegetation; though in the case of the latter the implied light-supply may be far in excess of older photic relations, as the oxygen capacity of the atmosphere again is beyond the available free supply of the water. The insistent problems of the land plant are mechanical support and orientation in the lighter medium of the air, protection from extreme loss of water, absorption and conduction from an attachment-surface following separation of the absorptive and photosynthetic tracts, and the adjustment of older reproductive organs to the exigencies of dispersal by air-currents instead of by moving water. In this way the inherited equipment of the algal soma is specialized and amplified to meet the new requirements. An epoch in which such natural selection may be rigorous over long-continued ages of slow progression and regression, has been visualized as a period of "Transmigration," effected *in situ*, as the sea-bottom may be partially exposed or again covered by oscillating changes in the earth's crust over geological epochs, as the net result of foldings of the surface-layers. Older laminar ramuli of algae attain further

elaboration of mechanism, orientations, and anatomy as "leaves"; attachment-ramuli exaggerate their absorbing function as they penetrate massed decaying material, now for the first time associated with minute heterotrophic organisms as bacteria, constituting the first soil. Internal and effete cell-units storing waste polysaccharide of photosynthesis are utilized as mechanically supporting fibres; others from a water-storing function attain a conductive significance as tracheides; intercellular spaces are elaborated in connexion with a transpiration mechanism which now becomes the only means of obtaining food-ions of inorganic nature. Most remarkably and constantly the asexual spore-tetrads, following meiosis in an asexual generation (as in *Dictyota* and Florideae), are utilized as air-borne spores: while the sexual gametes retain their older plankton mechanism of sexual fusion in an aqueous medium, so far as this may be available From such beginnings arise the Bryophyta (Mosses) in which fertilization *in situ* is associated with the more or less complete parasitic decadence of the spore-producing generatinn, and the Pteridophyta (Ferns), in which great perfection of the free asexual land-plant is associated with a sexual phase reduced to a mere protonema stage with precociously effective sexual organs, correlated with a minimum period in which the necessary water may be available; and sori of tetraspores are adapted to a sporangial mechanism which will dehisce in the air.

No plant-phylum which had not previously attained to a two-phase cycle has made good on the land; since following the attainment of fertilization *in situ* the asexual spores of the complementary generation or "person" were required for a dispersal function. Higher types of land-vegetation follow the Pteridophyte progression, passing on to the evolution of the seed-habit as Spermatophyta; in so doing expressing the successful method of evading problems of the utilization of free external water for the plankton process of fertilization. Much residual algal life of simple category persists as heterotrophic races of fungi, in which the problem of aquatic cross-fertilization is largely solved by eliminating it altogether, or retaining mechanism in the merest vestigial expressions. Suggestions as to the time involved in such evolutionary progression have been emphasized by data for the decay of radio-active minerals, as affording a time-chart by means of which geological epochs may be approximately estimated. The datum of 300 million years for the Carboniferous and Devonian, in which forest-trees of coniferous habit are known to have existed, as also the *Rhynia* group of the Lower Devonian which may express extreme types of Pteridophyta or limiting cases of Bryophyta, appears but of small value in the evolution of such high-grade land organisms as timber-trees from mere marine algae. A general estimate of 2,000 million years for the first stages of transmigration may not appear excessive; and behind this stretches the indefinite range of the evolution of the algal series, to the more remote epochs of the plankton-phase of the evolution of the cell in all its manifold possibilities and controlling functions, from the material of sea water alone. Yet in these respects there can be little doubt that the autotrophic plant, as the sole response of what is termed life to the biological factors of ancient seas, is more likely to be a sure guide to the history of the more modern world than any biologically unsupported and equally fragmentary testimony of the rocks. From the standpoint of conventional views of "descent" the story of evolution now becomes the history of biological and physiological progression to higher horizons as determined by changes in the condition of the external environment, of which residual plant-groups, each as absolutely cut off behind as non-progressive in other respects, remain as "Landmarks of Limitation" to point the way the progression has passed, as wholly isolated genetically as if the independent creations of an older philosophy, yet all meeting in the phase of the common initial medium of the sea.

IX. *Anatomy and Palaeobotany.*—Progress in anatomical, and in palaeontological Botany essentially go hand in hand. The discoveries of well-petrified new forms of fossil plants, which are often difficult of identification, lead to more critical examination of the structure of recent plants, and thus bring to light interesting features in the latter. Yet both the methods pursued and the type of material available for the botanist and palaeobotanist tend to differ. Knowledge of the anatomy of the fossil *Angiosperms*, for instance, has been naturally restricted owing to the scarcity of material other than of Tertiary age; while the isolated fragments of Tertiary wood have not attracted any particular attention in recent years, largely owing to the difficulty of mastering the overwhelming mass of living species with which they have to be compared. The origin and phylogenetic source of the Angiospermic families is thus still wrapt in mystery in spite of various theoretical conceptions. The only secure fact is that in geological time corresponding to the Wealden in Great Britain, and approximately to the Neocomian of the world, *no* reliable material of Angiosperms of any sort has yet been discovered. Claims to have identified Angiosperms in these or earlier rocks are not substantiated, and originated from such errors as incorrect diagnosis of ferns possessing reticulated venation like *Dictyophyllum* (see exposures by Berry, 1911, and Stopes, 1915).

The earliest authentic Angiosperms are found in the Lower Greensand or Aptian of Great Britain. The flora of this epoch was markedly distinct from that of the Wealden, which is of the Jurassic type; that of the Lower Greensand, on the contrary, was a rich, mixed flora, including many varieties of coniferous woods, the famous *Bennettites Gibsonianus* described by Carruthers, and other Bennettitalian plants, and, in particular, several Angiospermic woods. The systematic position of these Angiosperms is scarcely determinable, owing to the fact that modern plant anatomists have not yet codified the significance of woody structures in the living genera in spite of the extensive beginning made by Moll and Jannsonius. The petrified features of the ancient genera *Cantia*, *Woburnia*, *Sabulia*, *Aptiana* and *Hythia* are in no way "primitive" or pseudo-Angiospermic, but exhibit typical features of highly organized Angiospermic timbers. Hence the origin of the Angiosperms remains obscure, and a problem to be solved only by the discovery of the anatomical features of Angiosperms of an even earlier age.

The American school headed by Jeffrey, although contributing little to the description of new fossil Angiosperms, has worked on the problem of their descent on the basis of a series of well-defined theories. Jeffrey's main thesis is that the herbaceous forms are less primitive than the woody, and "the degenerate herb is derived from ancestral forms characterized by woody stems." While Jeffrey's conclusions and deductions are not universally accepted, workers of his school have contributed handsomely to the accumulation of data from living forms, and his text-book of anatomy attempts to bring out guiding principles, chief among which is the "Doctrine of Conservative Organs," springing from Scott's observations on the Cycadales, and the "Doctrine of Reversion." In Britain no comprehensive theoretical work on general anatomy has appeared recently. The anatomy of seedlings has been pursued (Hill and Thomas), but, unfortunately, has no corresponding development in palaeontological works owing to their tenuous rarity.

From rocks of Palaeozoic age onwards, well-petrified *Gymnosperms* are constantly being discovered, and the study of their structures has necessitated the reëxamination of all the modern genera. A steady output of memoirs dealing with the anatomy of living and fossil gymnosperms has been maintained (see in particular the works of Seward, Groom, Stopes, Gothan, Thomson, Hollick and Jeffrey, Coulter and Chamberlain, and others). While the English school have in the main added wherever possible new data on the recognized accepted lines of the generic grouping, Americans under Jeffrey have actively maintained the heterodox view that the Araucarineae are less primitive than the Abietineae, basing most of their generalizations on the minutiae of tracheid structure, which appeared clearer and more dogmatic guides so long as comparatively little was known of the infinite variety of the Mesozoic forms, but which have become self-contradictory as generic or even specific diagnostic features when such a wealth of material as is now available has been examined.

The primitive Palaeozoic gymnosperms are gradually becoming very well known from the relative frequency with which their stems, leaves and other parts are found petrified. The most notable recent addition to the group is the exceptional little flora of plants from the very base of the Carboniferous of Kentucky (see Scott and Jeffrey) which bears considerable likeness to the primitive Saalfeld flora described long since by Unger.

Anatomical work on the large group of the *Bennettitales* (which became entirely extinct before the Tertiary period) has yielded results of morphological and phylogenetic importance, and enriched general concepts of fructification and seed structure. Such work, initiated in 1870 by Carruthers, with his acute determination of the type fossil, remained for long in abeyance owing to the dearth of material in Britain, but was continued on the Continent in the last decade by Lignier and recently in England by Stopes. Studies on this group were actively pursued in America by Wieland, the main results of which are collected in his two magnificent volumes *American Fossil Cycads*, from which the diagrammatic restoration of the peculiar fructifications and many interesting points of vegetative anatomy have proved a mine of information for theorizers. The view that the Bennettitales were ancestral angiosperms was, temporarily at any rate, held by a number of leading botanists and received definite expression by Arber and Parkin. This view, however, is not built on a sufficiently secure anatomical foundation. The vascular peculiarities and vegetative appearance of the Bennettitales are so closely allied to those of Cycads still living that their complex gymnospermic fructifications are best looked upon as no

more than a specialization on "prophetic" lines by a cohort which became extinct, comparable to another specialization in another family in an earlier epoch, viz. the "seed-like" structures of the tree forms of the Lepidodendrons, which though truly Lycopodiaceous, developed "seeds." Another branch of the great Mesozoic group, the Williamsoniaceae, may prove to be better accredited forerunners of some angiospermic cohorts. The small form Williamsoniella, described by Thomas from the Jurassic, has an interesting and suggestive morphology. Anatomical work on the genus, however, still awaits the discovery of suitably preserved material.

Interest in the Cycads proper, stimulated in the preceding decade, has been continued. Their fructifications and general anatomy have been searchingly examined for primitive features (Matte, Stopes, Chamberlain, Seward, Worsdell), but still remarkably little is known of the geological history or early structure of the Cycads proper.

Anatomical work on the *Pteridophytes* has made steady progress, as is evidenced by the considerable enlargement of the first volume of the new edition of Scott's classic "Studies." Data of interest to anatomists have been chiefly based on Coal Measure species, filling in supplementary details in previously well-established schemes. The most important contribution in this connexion has been the thorough handling of the Osmundaceae, made possible by discoveries of well-petrified Mesozoic and Tertiary species (see in particular the series of Memoirs by Kidston and Gwynne-Vaughan). From an anatomical study of a series of species, the authors were able to present a phylogenetic sequence in the evolution of the family from Palaeozoic times, and held that the group arose from solid protostelic ancestors. Their view has been substantiated by the recent discovery of a true protostelic Osmundaceous form. The Botryopterideae, with their intricate series of stelar variations continued to receive detailed consideration (see Bertrand, Scott, Zalessky, Gordon and others) in the last decade, and are now very thoroughly known. A fern of wide geological distribution and of peculiar anatomical structure was at last made clear by the work of Kidston and Gwynne-Vaughan on *Tempskya*. Access to the original paper published in Russia is difficult and reference should also be made to Stopes, 1915. The work of Schoute on the branching of the Pteropsida should be read in connexion with *Tempskya* which had an extraordinary, massive tree-fern-like trunk, really built up of a weft of fine solenostelic stems, petioles and roots. Although anatomical work (by Tansley, Lang, Seward and others) has been done on various genera of recent ferns, good petrified material from the Mesozoic or Tertiary is either very scarce or has not received that anatomical attention which makes it possible to demonstrate the phylogenetic series connected with the higher families of recent ferns, such as Kidston and Gwynne-Vaughan have presented for the Osmundaceae. Yet where anatomical studies have been undertaken on recent genera, as by Lang on the Ophioglossaceae, they are largely influenced by the general principles of palaeobotany and the theme (as a sort of *leit-motif*) of the solid ancestral stele, runs through such work.

Of the lower Pteridophytes, our knowledge of those impressive members of the Lycopodiaceae, the Lepidodendroid series, was already essentially established, and in the last decade has merely received detailed amplification.

In the more primitive groups, however, great advances have recently been made through the active interest taken in the Devonian flora by Halle of Norway, who described the morphology and part of the structural details of a number of noteworthy species. This was soon followed by Kidston and Lang, to whom were entrusted the plant materials of the now famous *Rhynia* cherts. The *Psilophyton* of Dawson, so long relegated to insignificance and by many considered to represent merely imperfect fragments, has thus suddenly become of great interest. In the Scottish cherts are well-petrified genera whose anatomy shows very much the type of structure postulated so long before by Dawson. *Sporangites* of Halle, *Rhynia, Hornea, Asteroxylon* of Kidston and Lang represent the earliest known land plants, and though varying in details, all show a remarkable simplicity of structure and arrangement of their aerial stems and terminal sporangia. These plants are stimulating discussion on the origin of land plants, the evolution of the Pteridophytes from the lower groups, and the morphology of the various organs in higher plants, and their anatomy is of deep morphological and phylogenetic significance.

Anatomical work on the *Bryophytes* still has to confine itself to living forms because fossils are almost non-existent. Various features of the last-described group of new fossils, however, are highly suggestive for those who consider the phylogeny of the mosses. That isolated family, the Characeae, is well represented in many deposits, and has been seriously taken in hand by Reid and Groves with full examination of the anatomy of many beautiful fossil forms.

In palaeontological as in modern anatomy, observation is generally concentrated on the vascular tissues, and particularly on the arrangement and character of the wood. This leads not infrequently to difficulties for the palaeobotanist, who sometimes finds in his specimens other portions of plants which are difficult to diagnose owing to the practical neglect of the comparative study of such organs by recent botanists. For instance, especially since the "clearing method" was popularized by Nathorst, the study of the "mummified" cuticles from fossils of all kinds has brought into prominence the general ignorance concerning the diagnostic value and main characters of the stomata and epidermal cells among recent plants. The palaeobotanist, therefore, has had to investigate groups of living forms to effect his own comparisons. This in small genera of gymnosperms has not been crushingly burdensome, and has resulted in considerable additions to our knowledge of the details of recent forms (see Berry, Halle, Thomas, Bancroft, Antev and others). But for workers among the more extensive families of recent angiosperms, comparisons have become overwhelmingly arduous. Recognition of the "mummified" or semi-preserved seeds of angiosperms found in Tertiary deposits has become a work of the highest specialization in the hands of Mr. and Mrs. Clement Reid, who have greatly extended our knowledge of recent deposits, both in England and on the European Continent.

In the above paragraphs the more botanical and phylogenetic aspects of plant anatomy have been considered. But the palaeobotanist has other functions, and he finds wider fields of application for an anatomical knowledge of fossil species. The value of the anatomical structures of the leaves, stems and so on of fossils of given localities and epochs in determining the nature of the climates of the past has long been recognized, and in the last decade this subject has chiefly been pursued by Berry in America, who has extensively surveyed the Upper Cretaceous and Tertiary climates and distribution of species. In the southern hemisphere, that "terra incognita," the Antarctic, has been a little illuminated by the collections (see Seward and others) brought back by the Scott expeditions. And Gothan has worked on the woods from the Arctic.

A specialized application of anatomical knowledge has developed in connexion with a detailed study of coal. Many of the earlier workers (Dawson, Williamson, Huxley and others) were interested in the spores and small structures to be seen in coal and in recent years section cutting has been improved by Lomax, who has demonstrated many beautiful structures in coal sections. More exact consideration of the relation of the different parts of the plants to the character and accumulation of different types of coal in conjunction with their chemical analyses, ash content and so on has recently been made by Stopes, Stopes and Wheeler, followed by Lessing, Tideswell and others. The detailed chemistry of the different cell units composing the plant body is now gradually being correlated with the qualities of the different fractions of a band of coal. The resistant properties of certain cells such as spores and cuticles (yielding fuels of peculiar types on a big scale such as the "Cuticle Coal" of Russia) are being followed up on a minuter scale in the fine zones in an ordinary band of British coal, which have been shown to contain correlated differences, both in the anatomical nature of their plant content, their physical and chemical properties, the nature of their ash and so on.

The bibliographies in the following books will give most of the references, except those of monographs published quite recently:—E. W. Berry, *Lower Cretaceous Deposits of Maryland* (1913), and *Upper Cretaceous and Eocene Floras of South Carolina and Georgia* (Washington, 1914); J. M. Coulter and C. J. Chamberlain, *Morphology of Gymnosperms* (Chicago, 1910); E. C. Jeffrey, *The Anatomy of Woody Plants* (Chicago, 1917); D. H. Scott, *Studies in Fossil Botany*, ed. 3 (London, 1920); A. C. Seward, *Fossil Plants, vol. iii.* (Cambridge, 1917); M. C. Stopes, *Catalogue of the Cretaceous Plants in the British Museum, vol. ii.* (London, 1915); M. C. Stopes and R. V. Wheeler, *The Constitution of Coal* (London, 1918); G. R. Wieland, *American Fossil Cycads, vol. ii.* (Washington, 1916). (M. C. S.)

X. *Cytology.*—Great advances have been made in the study of cytology, but considerable divergence of opinion still exists with regard to many details of nuclear phenomena (*see* also the separate article CYTOLOGY).

The discrepancies and contradictions present in the accounts of *mitosis* are due to the fact that no animal or plant has been found in which all of the phases connected with nuclear division can be elucidated. Each form has individual cytological characters, and its nuclei may show some stages with exceeding clearness, whilst others may be disguised or apparently even eliminated. The true version will only be attained by wider comparative investigations.

(1) *Somatic divisions* (fig. 1). Most cytologists agree that, as a rule, during telophase each somatic chromosome splits into longitudinal halves (threads), and these halves tend to separate, forming more or less of a reticulum, according to the degree of interkinetal rest assumed by the nucleus. The prophase stages are interpreted in two ways: (*a*) that the pairing of threads in the prophase is the reassociation of the chromosome halves which separated during the preceding telophase, that these gradually come together to form the univalent chromosome, and separate as daughter chromosomes on the ensuing spindle; (*b*) that the pairing of threads and the splitting of the univalent chromosomes into daughter halves are purely prophasic phenomena and bear no relation to the splitting of the chromosomes in telophase. (Fraser and Snell 1911, Müller 1921, Grégoire 1912, 1913, Sharp 1913, Digby 1919.)

(2) *First Meiotic division.* Controversy rages over the mode of

origin of heterotype chromosomes. The differences between the two schools of thought ("telosynaptists" and "parasynaptists") rest on the interpretation of the heterotype prophases (Farmer 1912) (fig. 4). Telosynaptists regard the paired threads of the

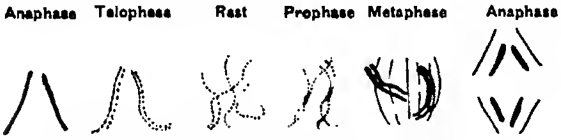

FIG. 1.—Diagram of a Somatic Divisiun.

presynaptic and synaptic phases (fig. 2) as the associating *halves* (homologous with the threads of the somatic prophases) of a somatic chromosome which separated during the preceding telophase, and maintain that the conjunction of the two *entire* homologuus somatic chromosomes takes place prior to, and during second contraction (fig. 3). Consequently the associating threads of synapsis only separate as daughter chromosomes on the homotype (2nd meiotic) spindle.

FIG. 2.

FIG. 2.—Synapsis (*Osmunda regalis*)
(After Grégoire)
(From *La Cellule*, vol. XXIV.)

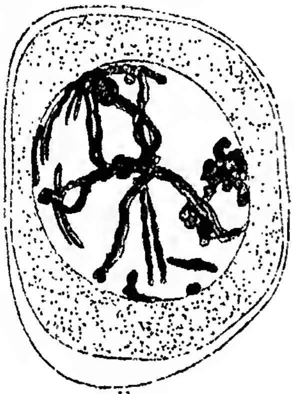

FIG. 3.

FIG. 3.—Second Contraction (*Smilacina*)
(After Lawson)
(From *Trans. Roy. Soc. Edinburgh*, vol. XLVIII.)

"Parasynaptists" (Grégoire's school), on the other hand, regard the parallel threads of the presynaptic and synaptic prophases (fig. 2) as the pairing of two *entire* homologous somatic chromosomes which will separate on the heterotype (1st meiotic) spindle. They attach no significance to the second contraction phase. (Stomps 1911, Davis 1911, Lawson 1912, Gréguire 1912, Fraser 1914, Nothnagel 1916, Digby 1919.)

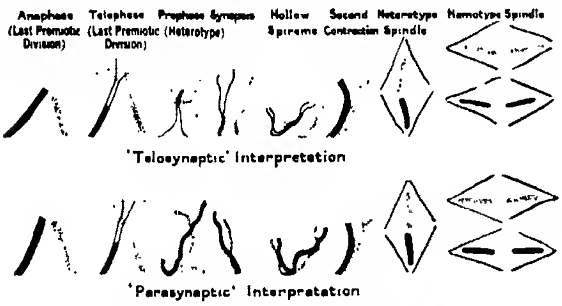

FIG. 4.—Diagram of Meiotic Phase.

The doctrine initiated by Boveri concerning the individuality of chromosomes is now widely supported. It is based on three main facts: (*a*) the continuity of chromosomes can sometimes be traced from telophase into the ensuing prophase, especially in rapidly dividing tissues; (*b*) the specific number of chromosomes, in any given animal or plant, recurs at each mitosis with extraordinary regularity.[1]

Tischler (1915) and Ishikawa (1916) have collated the numbers recorded in plants: (*c*) chromosomes with striking individual characters of size and shape, distinguishing them from others in the nucleus, occur in many animals and plants. These characteristic chromosomes invariably reappear at every mitosis.

Recently much attention has been given to the significance of specific numbers of chromosomes. It has been conclusively shown that closely allied species of many families have *related* chromosome numbers, *i.e.* multiples of a common factor. Thus diploid, triploid, tetraploid,[2] etc., forms are distinguished (Marchal 1912, Gregory 1914, Winge 1917, Holmgren 1919, Kuwada 1919, Rosenberg 1920). This multiplication of chromosomes may prove to have an important bearing on mutation, *e.g. Primula sinensis* 12 (haploid number), *P. sinensis* (giant) 24 (haploid number), *Crepis virens* 3 (haploid number), *Crepis tectorum* 4 (haploid number), *Crepis rubra* 5 (haploid number), *Oenothera Lamarckiana* 7 (haploid number), *O. gigas* 14 (haploid number) (fig. 5).

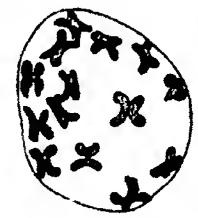

FIG. 5.

Oenothera Lamarckiana (7 pairs of chromosomes) — *Oenothera gigas* (14 pairs of chromosomes)
(Interkinesis between Heterotype and Homotype Mitoses)
(After Davis) — (From *Ann. of Bot.*, vol. XXV.)

As regards dimensions, the width of chromosomes, both in animals and plants, is inconstant and more or less variable, and is in no way correlated with phylogenetic affinity (Farmer and Digby 1914).

Among other points of importance, recent work on hybrids (Rosenberg 1917) confirms previous observations, that the offspring of parents with an unlike number of chromosomes show irregular meiotic divisions. The classical experiments of Němec who, by submitting root tips to the action of chloral hydrate, produced multinucleate cells and abnormal mitoses, have been extended (Sakamura 1920). Extrusion of particles of nuclear substance, especially as globules from the nucleolus, has been repeatedly observed in animal and plant cells (fig. 6); this phenomenon probably denotes some important physiological interchange between nucleus and cytoplasm (von Derschau 1915 and 1920).

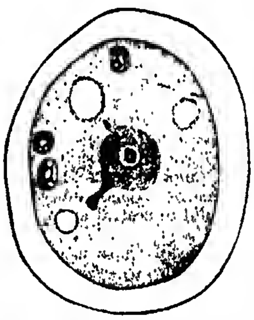

FIG. 6.—Extrusion of Nuclear Substance (*Funaria hygrometrica*)
(After von Derschau)
(From *Archiv für Zellforschung*, vol. XIV.)

Many authorities believe that chromosomes determine the segregation of Mendelian characters and that mitosis provides precisely the mechanism required. Gates and Thomas (1914) have shown that those Oenothera mutants *lata* and *semilata*, which possess an extra chromosome, *i.e.* 15 instead of 14 (somatic number), always have a characteristic type of foliage and habit (fig. 7).

Bibliography.—Two new text-books have been published (Agar 1920, and Doncaster 1920), and Wilson's *Cell* has been reprinted (1919). On special points, the following may be mentioned:—Davis, "Cytological Studies on Oenothera III. A Comparison of the Reduction Divisions of *Oenothera Lamarckiana* and *O. gigas*," *Ann. of Bot.* (1911, vol. XXV.); von Derschau, "Der Austritt ungelöster Substanz aus dem Zellkerne (Eine zusammenfassende Studie)," *Archiv f. Zellforschung* (1915, vol. XIV.), "Pflanzliche Plasmastrukturen und ihre Beziehungen zum Zellkern," *Flora* (1920, vol. XIII.); Digby, "On the Archesporial and Meiotic Mitoses of Osmunda," *Ann. of Bot.* (1919, vol. XXXIII.); Farmer, "Telosynapsis and Parasynapsis," *Ann. of Bot.* (1912, vol. XXVI.); Farmer and Digby, "On Dimensions of Chromosomes considered in relation to Phylogeny," *Phil. Trans. Series B.* (1914, vol. CCV.); Fraser, "The Behaviour of the Chromatin in the Meiotic Divisions of *Vicia Faba*," *Ann. of Bot.* (1914, vol. XXVIII.); Fraser and Snell, "The Vegetative Divisions in *Vicia Faba*," *Ann. of Bot.* (1911, vol XXV.); Gates and Thomas, "A Cytological Study of *Oenothera* mut. *lata* and *Oe.* mut. *semilata* in Relation to Mutation," *Quart. Journ. Micr. Sci.* (1914, vol. LIX.); Grégoire, "Les Phénomènes de la métaphase et de l'anaphase dans la caryocinèse somatique," *Ann. Soc. Scientif. de Bruxelles* (1912, vol XXXVI.); "La vérité du

[1] The number of chromosomes is inconstant in degenerating tissues such as endosperm and tapetum; nuclei with a double number may occur in root tips (Strasburger 1911).

[2] Winkler (1920) has produced tetraploid forms artificially.

more than a specialization on "prophetic" lines by a cohort which became extinct, comparable to another specialization in another family in an earlier epoch, viz. the "seed-like" structures of the tree forms of the Lepidodendrons, which though truly Lycopodiaceous, developed "seeds." Another branch of the great Mesozoic group, the Williamsoniaceae, may prove to be better accredited forerunners of some angiospermic cohorts. In the more primitive groups, however, great advances have recently been made through the active interest taken in the Devonian flora by Halle of Norway, who described the morphology and part of the structural details of a number of noteworthy species. This was soon followed by Kidston and Lang, to whom were entrusted the plant materials of the now famous *Rhynia* cherts. The *Psilophyton* of Dawson, so long relegated to insignificance and by many considered to represent merely imperfect fragments, has thus suddenly become of great interest. In the Scottish cherts are well-petrified genera whose anatomy shows very much the type of structure postulated so long before by Dawson. *Sporangites* of Halle, *Rhynia, Hornea, Asteroxylon* of Kidston and Lang represent the earliest known land plants, and though varying in details, all show a remarkable simplicity of structure and arrangement of their aerial stems and terminal sporangia. These plants are stimulating discussion on the origin of land plants, the evolution of the Pteridophytes from the lower groups, and the morphology of the various organs in higher plants, and their anatomy is of deep morphological and phylogenetic significance.

Anatomical work on the *Bryophytes* still has to confine itself to living forms because fossils are almost non-existent. Various features of the last-described group of new fossils, however, are highly suggestive for those who consider the phylogeny of the mosses. That isolated family, the Characeae, is well represented in many deposits, and has been seriously taken in hand by Reid and Groves with full examination of the anatomy of many beautiful fossil forms.

In palaeontological as in modern anatomy, observation is generally concentrated on the vascular tissues, and particularly on the arrangement and character of the wood. This leads not infrequently to difficulties for the palaeobotanist, who sometimes finds in his specimens other portions of plants which are difficult to diagnose owing to the practical neglect of the comparative study of such organs by recent botanists. For instance, especially since the "clearing method" was popularized by Nathorst, the study of the "mummified" cuticles from fossils of all kinds has brought into prominence the general ignorance concerning the diagnostic value and main characters of the stomata and epidermal cells among recent plants. The palaeobotanist, therefore, has had to investigate groups of living forms to effect his own comparisons. This in small genera of gymnosperms has not been crushingly burdensome, and has resulted in considerable additions to our knowledge of the details of recent forms (see Berry, Halle, Thomas, Bancroft, Antev and others). But for workers among the more extensive families of recent angiosperms, comparisons have become overwhelmingly arduous. Recognition of the "mummified" or semi-preserved seeds of angiosperms found in Tertiary deposits has become a work of the highest specialization in the hands of Mr. and Mrs. Clement Reid, who have greatly extended our knowledge of recent deposits, both in England and on the European Continent.

In the above paragraphs the more botanical and phylogenetic aspects of plant anatomy have been considered. But the palaeobotanist has other functions, and he finds wider fields of application for an anatomical knowledge of fossil species. The value of the anatomical structures of the leaves, stems and so on of fossils of given localities and epochs in determining the nature of the climates of the past has long been recognized, and in the last decade this subject has chiefly been pursued by Berry in America, who has extensively surveyed the Upper Cretaceous and Tertiary climates and distribution of species. In the southern hemisphere, that "terra incognita," the Antarctic, has been a little illuminated by the collections (see Seward and others) brought back by the Scott expeditions. And Gothan has worked on the woods from the Arctic.

A specialized application of anatomical knowledge has developed in connexion with a detailed study of coal. Many of the earlier workers (Dawson, Williamson, Huxley and others) were interested in the spores and small structures to be seen in coal and in recent years section cutting has been improved by Lomax, who has demonstrated many beautiful structures in coal sections. More exact consideration of the relation of the different parts of the plants to the character and accumulation of different types of coal in conjunction with their chemical analyses, ash content and so on has recently been made by Stopes, Stopes and Wheeler, followed by Lessing, Tideswell and others. The detailed chemistry of the different cell units composing the plant body is now gradually being correlated with the qualities of the different fractions of a band of coal. The resistant properties of certain cells such as spores and cuticles (yielding fuels of peculiar types on a big scale such as the "Cuticle Coal" of Russia) are being followed up on a minuter scale in the fine zones in an ordinary band of British coal, which have been shown to contain correlated differences, both in the anatomical nature of their plant content, their physical and chemical properties, the nature of their ash and so on.

The bibliographies in the following books will give most of the references, except those of monographs published quite recently:—

Chamberlain, *Morphology of Gymnosperms* (Chicago, 1910); E. C. Jeffrey, *The Anatomy of Woody Plants* (Chicago, 1917); D. H. Scott, *Studies in Fossil Botany*, ed. 3 (London, 1920); A. C. Seward, *Fossil Plants, vol. iii.* (Cambridge, 1917); M. C. Stopes, *Catalogue of the Cretaceous Plants in the British Museum, vol. ii.* (London, 1915); M. C. Stopes and R. V. Wheeler, *The Constitution of Coal* (London, 1918); G. R. Wieland, *American Fossil Cycads, vol. ii.* (Washington, 1916). (M. C. S.)

X. *Cytology.*—Great advances have been made in the study of cytology, but considerable divergence of opinion still exists with regard to many details of nuclear phenomena (*see* also the separate article CYTOLOGY).

The discrepancies and contradictions present in the accounts of *mitosis* are due to the fact that no animal or plant has been found in which all of the phases connected with nuclear division can be elucidated. Each form has individual cytological characters, and its nuclei may show some stages with exceeding clearness, whilst others may be disguised or apparently even eliminated. The true version will only be attained by wider comparative investigations.

(1) *Somatic divisions* (fig. 1). Most cytologists agree that, as a rule, during telophase each somatic chromosome splits into longitudinal halves (threads), and these halves tend to separate, forming more or less of a reticulum, according to the degree of interkinetal rest assumed by the nucleus. The prophase stages are interpreted in two ways: (*a*) that the pairing of threads in the prophase is the reassociation of the chromosome halves which separated during the preceding telophase, that these gradually come together to form the univalent chromosome, and separate as daughter chromosomes on the ensuing spindle; (*b*) that the pairing of threads and the splitting of the univalent chromosomes into daughter halves are purely prophasic phenomena and bear no relation to the splitting of the chromosomes in telophase. (Fraser and Snell 1911, Müller 1921, Grégoire 1912, 1913, Sharp 1913, Digby 1919.)

(2) *First Meiotic division.* Controversy rages over the mode of

believed in him and trusted him. Simple, modest, without personal ambition, he had yet the greatest gift in a national leader, personality. His kindliness was transparent, his temperament always inclined to compromise, his mind naturally impartial. In small things he inclined too often to give way. But in the big things his discernment of principle was unerring, his resolution adamant. Greatness was his by right of nature, a greatness recognized and acclaimed in his last years by the world no less than by his own countrymen. (B. K. L.)

BOURASSA, HENRI (1868–), French Canadian politician, was born in Montreal Sept. 1 1868, his mother being a daughter of L. J. Papineau. He became well known at a comparatively early age as an active writer and speaker on the side of the Nationalist movement in Canada, and a leader of the younger school of French Canadians. He was elected to the Dominion House of Commons in 1896, but resigned in protest against Canadian participation in the S. African War, 1899; he was re-elected, however, in 1900 and in 1904. He was a member of the Quebec Legislative Assembly in 1908–12. A gradual severance took place between him and his old chief, Sir Wilfrid Laurier, until in later years he became obsessed with the idea that Laurier's policy was fatal to the best interests of Canada and especially to Quebec. A speaker of extraordinary power and fascination, both in Parliament and on the platform, even Laurier himself could not sway the French Canadians as Bourassa could; and in spite of his extreme views he was heard with respect even in the strongholds of his opponents in Toronto.

BOURCHIER, ARTHUR (1864–), English actor (*see* 4.329), produced in 1910 *Henry VIII.* and *Macbeth* at the Garrick theatre, London, and in the same year joined Herbert Tree at His Majesty's theatre, where both he and his wife played again in these and other Shakespeare plays. He also played Iago to Mr. Matheson Lang's Othello in 1920. After the dissolution of his earlier marriage with Miss Violet Vanbrugh he married in 1918 Miss Kyrle Bellew, with whom he continued to appear in modern melodrama. He acted Old Bill in Capt. Bairnsfather's war play *The Better 'Ole* (1917).

BOURCHIER, JAMES DAVID (1850–1920), British publicist, who came of a good Irish family, was born at Bruff, co. Limerick, Dec. 18 1850. He was educated at Trinity College, Dublin, and King's College, Cambridge, and afterwards was for some years an assistant master at Eton. Subsequently joining the staff of *The Times*, in 1888 he went as special correspondent of *The Times* to Rumania and Bulgaria, and for nearly 30 years he was its principal representative in south-eastern Europe. In this capacity he established a unique authority for information on Balkan affairs, and was in the confidence of the leading statesmen. He played an important part behind the scenes in the formation of the Balkan League (1911–2); and though from time to time his advice to one party or another proved unpalatable, his disinterestedness was always as unquestionable as his accurate knowledge of the political issues involved. In the later years before the World War his prepossessions were somewhat markedly on the side of Bulgaria, and even during the war his sympathies were with Bulgaria as a country. He died at Sofia, Dec. 30 1920, and was given a public funeral there. Besides his contributions to *The Times* he was the author of many review articles, and also of the general articles, historical and descriptive, on the different Balkan States and Greece in the 11th Edition of this Encyclopædia.

BOURGEOIS, LÉON VICTOR AUGUSTE (1851–), French statesman (*see* 4.330), became minister without portfolio in the Briand Government during the World War. He took an active interest in the movement for a League of Nations, was appointed to draft its statutes and became president of the French section. He was elected president of the Senate in 1918.

BOURGET, PAUL CHARLES JOSEPH (1852–), French novelist and critic (*see* 4.331), published after 1910 several new novels, including *La Vie passe* (1910), *Le Sens de la Mort* (1915), *Lazarine* (1917), *Némésis* (1918), and *Laurence Albani* (1920), as well as three volumes of short stories and two plays, *La Barricade* (1910) and *Le Tribun* (1912). Two other plays, *Un Cas de Conscience* (1910) and *La Crise* (1912), were written by him in collaboration. A volume of critical studies appeared in 1912 and one of travel sketches, *Le Démon du Midi*, in 1914.

BOURNE, FRANCIS (1861–), English Cardinal and Archbishop of Westminster, was born at Clapham on March 23 1861, and educated at Ushaw, Ware, St. Sulpice (Paris) and the university of Louvain. He was ordained priest in 1884, and in 1889 became rector of the Southwark diocesan seminary which he had founded. In 1895 he was appointed domestic prelate to Pope Leo XIII., and in 1897 Bishop of Southwark. In 1903 he succeeded Cardinal Vaughan as Archbishop of Westminster, and on Nov. 27 1911 was created cardinal (titular of S. Pudenziana) by Pope Pius X.

BOVEY, HENRY TAYLOR (1852–1912), English engineer, was born in Devon in 1852. He was educated at Queen's College, Cambridge, of which he was afterwards elected fellow. Joining the staff of the Mersey Docks and Harbour Board, he became assistant engineer, but in 1887 was appointed professor of civil engineering and applied mechanics at McGill University, Montreal. In 1909 he was appointed to be the first rector of the Imperial College of Science and Technology in London, but ill-health obliged him to resign the post after a few months. He died at Eastbourne Feb. 2 1912.

BOWELL, SIR MACKENZIE (1823–1917), Canadian statesman (*see* 4.342), died at Belleville, Ont., Dec. 17 1917.

BOWLES, THOMAS GIBSON (1841–), British journalist and politician, was born in London in 1841, and was educated at King's College, London. In 1860 he entered the Inland Revenue office, remaining there until 1868, and afterwards travelled extensively. He subsequently became connected, either as journalist or proprietor, with various newspapers, notably *Vanity Fair*, *The Lady*, and offshoots from the last-named periodical. From 1870 to 1871 he was correspondent for the *Morning Post* in Paris. He was elected as a Conservative for King's Lynn in 1892, and held the seat till 1906, when he was defeated, largely owing to his advocacy of free trade. He was elected for the same seat as a Liberal in 1910, but was unsuccessful in the second general election of that year. He became well known as an expert in parliamentary procedure and a critic on public finance. In 1916 he was elected for the southern division of Leicester. Mr. Gibson Bowles was always prominent as an opponent of any diminution of British sea power, and he published *Maritime Warfare* (1878); *Flotsam and Jetsam* (1882); *Log of the Nereid* (1889); *The Declaration of Paris of 1856* (1900) and *Sea Law and Sea Power* (1910).

BOXING: *see* SPORTS AND GAMES.

BOYLE, JOHN J. (1851–1917), American sculptor (*see* 4.354), died in New York Feb. 10 1917. He was made an associate member of the National Academy of Design in 1910, and received a silver medal at the Panama-Pacific Exposition, San Francisco, 1915.

BOYLESVE, RENÉ, the pen-name of RENÉ MARIE AUGUSTE TARDIVEAU (1867–), French novelist, who was born at La Haye Descartes, Indre-et-Loire, April 14 1867. He was educated at Poitiers and Tours, and afterwards adopted literature as a profession. His first work was *Le Médecin des Dames de Néans* (1896), and henceforth he wrote voluminously, publishing not only novels but many short stories. He is a close observer of the provincial society of France. His later works include *Sainte Marie des Fleurs* (1897); *Le Parfum des Îles Borromées* (1898); *L'Enfant à la Balustrade* (1904); *Le Bel Avenir* (1905); *Mon Amour* (1908); *Tu n'es plus Rien* (1917); and *Nymphes dansant avec des Satyres*, a volume of tales (1920). He was received into the French Academy on March 20 1919.

BOYNE, LEONARD (1853–1920), Irish actor, was born at Westmeath April 11 1853 and was educated for the army. He first appeared on the stage in Liverpool in 1870. On May 2 1874 he played John Fern in *Progress* at the St. James's theatre, London. He played the principal part in Henry Arthur Jones's *The Masqueraders* in 1894, and appeared in Pinero's *The Benefit of the Doubt* in 1895. In 1902 he made a success with Miss Marie Tempest in *The Marriage of Kitty*

(the English version of de Grésac and de Croissel's *La Passerelle*), and he toured with this play in America. Later he played Conan Doyle's *Raffles* in the English provinces. He died in London April 17 1920.

BOY SCOUTS.—A brief reference was made in the article SCOUT (24.476) to the institution in England in 1908 of the Boy Scout movement. In later years it developed so strongly, both in England and in other countries, being also imitated, hardly less successfully, by that of the Girl Guides on similar lines, that its history requires fuller record.

In 1893–4, when serving with his regiment, the 13th Hussars, Sir Robert (then Lt.-Col., and later Lt.-Gen.) Baden-Powell realized that the ordinary peace training of soldiers for service in the field was not sufficiently practical, and he therefore carried out classes of training in his squadron for the men individually in scouting and campaigning. In 1897·8, having been transferred to command the 5th Dragoon Guards, he carried on similar training, but on improved lines, with a view to developing character—*i.e.* manliness, self-reliance, and reliability—as well as field efficiency since these were largely lacking in lads coming into the army from the ordinary board school. His lectures and practices were collated and published in a small book, *Aids to Scouting*.

During the South African War, 1899–1900, Maj. Lord Edward Cecil, Baden-Powell's chief staff officer, organized the boys of Mafeking as a corps for general utility on scout lines rather than those of cadets, and the experiment was an entire success. The experience showed that, if their training were made to appeal to them, boys would learn readily, and also that boys were capable of taking responsibility to a far greater degree than was generally believed, if only they were trusted. The troop was made a small unit, in order that the commander should be able to deal with each individual on personal knowledge of him; the system of patrols was instituted, of six boys under a leader. In carrying out the organization of the South African Constabulary, 1901 3, Baden-Powell employed the same principles on an extended scale. Responsibility was thus given to the junior non-commissioned officers, and emulation between the patrols produced a good spirit and a higher standard of efficiency all round. The human side was appealed to, and the men were trusted on their honour to a very large degree in carrying out their duties. Their uniform for field work was the cowboy hat, shirt, green tie, and shorts. Badges were awarded for proficiency in different lines of work.

In 1907 Sir Robert held a trial camp for scout training for boys at Brownsea I., at which he had boys of every class to experiment upon, and its results exceeded his expectations and prompted him to go on with the idea. The training was based on that which he had employed with soldiers and the constabulary, with some adaptation to make it suitable for boys, following the principles adopted by Zulus and other African tribes which reflected some of the ideas of Epictetus and the methods of the Spartans, and of the ancient British and Irish, for training their boys. He also looked into the Bushido of the Japanese, as well as the more modern method of John Pounds for dealing with boys, and Jahn for their physical culture, as well as those put in practice by Sir William Smith, Seton-Thompson, Dan Beard and others. In Jan. 1908, he brought out the handbook of the training, entitled *Scouting for Boys*, in six fortnightly parts. A number of troops were started in different parts of the United Kingdom before the series was half completed. Although he had only anticipated that scouting would be taken as an additional attraction for their boys by the Boys' Brigade and Church Lads' Brigade, it became evident that a separate movement was required to deal with the number of boys who were taking it up unconnected with these bodies.

In 1910, the Boy Scout movement had grown to such dimensions (123,930) that Sir Robert felt it incumbent upon him to leave the army in order to take the movement in hand as "Chief Scout." With a view to making the subject appeal to boys, and to meet their spirit of adventure, he held up for their ideal the doings of backwoodsmen, knights, adventurers and explorers, as the heroes for them to follow. These he grouped generally under the title "Scouts." Through camp life, boat work, pioneering and nature study could be found all the attractions for a boy which at the same time would be the medium of instruction. The instruction took the form of active self-expression on the part of the boy, rather than his passive reception of ideas.

Partly from his own experience and partly from that of others, Sir Robert worked out what was lacking in the training in the average schoolboy. The deficiency lay chiefly in the direction of:—(1) Character and general intelligence; (2) skill and handicrafts; (3) physical development and health knowledge; (4) service for others and for the State. The activities and practices of scouting were, therefore, framed as far as possible to develop in (1), (2), and (3) the efficient individual, and then to harness his individuality for the good of the community, *i.e.* citizenship. Honour was made the high ideal for the boys. The Scout Law, on which the movement hinges, was taken from the code of the knights.

King Edward, and later King George V., became the patron of the association of Boy Scouts, and the Duke of Connaught its president. Administration was decentralized from the Imperial Headquarters Council (at 25, Buckingham Palace Road, London) through county commissioners, district commissioners, and local associations to the scoutmasters in charge of troops.

For organization the troop was purposely kept small in numbers (40 being regarded as the best maximum), in order that the scoutmaster should have personal knowledge of each of his boys, this being the only possible way of developing the character of the individual. The patrol system was adopted from that of the South African Constabulary, and for the same reason. An extensive system of badges was instituted, as in the Royal navy and the constabulary, for excellence in different branches of work.

The Boy Scout movement is non-military, non-political, non-class and interdenominational. Its aim is to make good citizens, and for this reason it was judged unnecessary to introduce military drill. Scoutcraft is a means through which the veriest hooligan can be brought to higher thought and to the elements of faith in God; and, coupled with the scout's obligation "to do a good turn every day," it gives the base of duty to God and to neighbour on which the parent or pastor can build with greater ease the form of belief that is desired. The *Scout Promise*, to carry out, *on his honour*, as far as in him lies, the *Scout Law*, is the binding disciplinary force. The aims and methods of the movement were inquired into by the Privy Council in 1912, and a Royal Charter of Incorporation was granted as an official recognition.

The outbreak of war in 1914 found thousands of scouts just sallying forth in their little, self-contained units with their trek carts and tents, and the Sea Scouts with their boats and equipment for their campings in the August holidays. By telegraph the object of their outing was changed; the Land Scouts were mobilized all over the country under the chief constables to protect the railway bridges, waterworks, telegraph and cable lines. At the same time Sea Scouts at once took over the duties of watching the coast from the coastguardsmen, who were called up for service afloat; and there they remained till the end of the war, working under the orders of the Admiralty. Some 23,000 boys took their turn at this service. Over 100,000 of the older scouts and scoutmasters took their places on service, and they did well. Ten thousand of them gave their lives for their country. Some of the V.C. heroes were Craig, Cates, Dimmer (also a Boys' Brigade man), Laidlaw, Toye, Cruikshank, McKean, Jack Cornwall, Dean, Haine and Hallowes, formerly Boy Scouts.

Through scouting the boy has the chance to deck himself in a frontier kit as one of the great brotherhood of backwoodsmen. He can track and follow signs, he can signal, he can light his fire and build his shack and cook his grub. He can turn his hand to many things in pioneer and campcraft. His unit is a band of six, commanded by their own boy leader. Here may be seen the natural gang of the boy, whether for good or for mischief; responsibility and self-discipline for the individual; and *esprit de corps* for the honour of the patrol, as strong as any house-spirit in a public school.

To the outsider's eye the scout's staves are so many broomsticks, but to the scout they are different. His staff, decorated with his own particular totem and signs, is typical; like his staff, among a mass he is an individual having his own traits, his own character, his own potentialities. He may be one of a herd, but he has his own entity. He gets to know the joy of life through the out-of-doors. Then there is the spiritual side. Through sips of nature lore, imbibed in woodland "hikes," the puny soul grows up and looks round. The outdoors is *par excellence* the school for observation and for realizing the wonders of a wondrous universe.

At Olympia, London, in July and Aug. 1920, was held perhaps the most significant gathering of boys that has ever been known, when some hundred thousand Boy Scouts from 27 different countries—for the movement has spread over the world—came together to show to the public something of the aims, methods and results of "Scouting for Boys." The fact that these boys, wearing the same uniform and obeying the same Scout Law, had started a remarkable personal inter-comradeship, might well be an important factor toward developing that spirit of good-will on the part of the peoples themselves that was essential to the hopes founded on the League of Nations.

In 1921 there were 350,000 Boy Scouts in the British Empire, and approximately a million and a half throughout the world.
(R. B.-P.)

United States.—Early in 1910 the idea of introducing into the United States the Boy Scout movement, with methods similar to those of the English Boy Scouts, which had been instituted in 1908 and developed under the personal supervision of Lt.-Gen. Sir Robert Baden-Powell, was first proposed by Mr. W. D. Boyce of Chicago. Before this time a number of troops had been started in various parts of the country by men who had been impressed with the possibilities of the scheme through reading Sir Robert's English handbook, "Scouting for Boys." It is significant that Mr. Boyce's interest was aroused by a service rendered him in true scout spirit by a London Boy Scout who, because of his obligation to do a good turn daily and the rule against the acceptance of gratuities, greatly astonished and impressed Mr. Boyce. After a conference with Sir Robert he secured the coöperation of friends in Washington, D.C., and on February 8 1910 incorporated an organization of the Boy Scouts of America under the laws of the District of Columbia. With the coöperation of other agencies interested in boys, the plans for the organization were developed, and the administration was undertaken by a national council working through an executive board and through local councils and scout officials throughout the country. In 1910 a small office was opened in New York and in 1911 headquarters were established at 200 Fifth Ave. in that city. Federal incorporation was granted by Act of Congress in June 1916.

Boy Scouts are organized in patrols, 8 boys to a patrol, 2 to 4 patrols to a troop. Each troop is under the charge of a scoutmaster, who must be an adult American citizen, and one or more assistant scoutmasters. Troops are organized in connexion with schools, churches and other institutions, or under the auspices of a group of representative citizens. For each troop there is a supervising group of adults known as a troop committee. Where there are two or more troops in a community their activities are directed and supervised by local councils.

The national council is made up of representatives from these local councils and other distinguished men from every state in the union. This body meets annually in New York City, where the Council has its administrative and executive headquarters. The president of the Boy Scouts of America in 1921 was Mr. Colin H. Livingstone of Washington, D.C.; its honorary president, the President of the United States, and its chief scout executive, James E. West.

The purpose of the Boy Scouts of America as stated in its constitution is "to promote through organization, and coöperation with other agencies, the ability of boys to do things for themselves and others, to train them in scout-craft, and to teach them patriotism, courage, self-reliance, and kindred virtues, using the methods which are now in common use by Boy Scouts, by placing emphasis upon the Scout Oath and Law for character development, citizenship training and physical fitness." The movement is non-sectarian and non-partisan. The motto of the organization is: "Be prepared."

The membership in Sept. 1921 was 410,676 registered scouts, 119,283 scout officials, 17,738 troops, 607 local councils. (J. E. W.)

Girl Scouts.—In March 1912 Mrs. Juliette Low organized in Savannah, Ga., a group of Girl Guides, patterned after and bearing the same name as the organization developed in England by Lt.-Gen. Sir Robert Baden-Powell and Lady Baden-Powell. In both cases the purpose was to offer girls activities similar to those open to Boy Scouts. The movement spread rapidly and on June 10 1915 the organization was incorporated and its name changed to Girl Scouts. At first the national headquarters were in Washington, D.C., but later removed to New York City. In Oct. 1921 the number of registered Girl Scouts was about 120,000, and applications for membership were being received at the rate of 3,000 per month. The purpose is to instill patriotism, to arouse the spirit of helpfulness, and to develop character, largely through outdoor group activity. The motto is "Be prepared"; and the slogan, "Do a good turn daily." Each member promises: "On my honour, I will try to do my duty to God and my country, to help others at all times, to obey the Scout laws."

These laws, ten in number, require a Girl Scout to be trustworthy, loyal, helpful, friendly, courteous, kind to animals, obedient, cheerful, thrifty, and clean in thought, word, and deed. Originally the age limit was fixed from 10 to 18 years, and this central group continued to be the largest; but later a separate division was formed for little girls, known as Brownies or Junior Scouts, and another division for mature girls, known as Citizen Scouts. The unit is a patrol of eight girls, who choose from their number a leader. One or more patrols form a troop, whose captain must be at least 21 years old and approved by the national headquarters. A captain may have one or more lieutenants, at least 18 years old and approved by the national headquarters. The official magazine is *The American Girl*, a monthly publication. (X.)

Camp Fire Girls.—Another organization, wholly distinct, representing the scout movement in the United States is the Camp Fire Girls, for girls over twelve. It was founded in 1912 to promote the ideals of the "home, health and citizenship." The training stimulates love of being out of doors and an interest in simple handicrafts like block-printing and weaving. The organization accomplishes its work by recognizing the doing of small tasks well and by awarding "honour-beads" in the seven Camp Fire "crafts" of "home, nature, health, hand, camp, business, and patriotism or citizenship." The slogan is "Give Service," and the watchword "Wohelo" (work, health, love). There were 130,000 members in 1921, living in every state of the United States and in 18 foreign countries. An allied junior organization is the Blue Birds. The official organ is *Everygirl's Magazine.* The headquarters of the Camp Fire Girls are in New York City.

BRACQUEMOND, FÉLIX (1833–1914), French painter (*see* 4.360), died in Paris Oct. 20 1914.

BRADBURY, SIR JOHN SWANWICK (1872–), English civil servant, was born at Winsford, Cheshire, Sept. 23 1872 and educated at the Manchester grammar school and Brasenose College, Oxford. He entered the civil service in 1896. Beginning in the Colonial Office, he was soon transferred to the Treasury. In 1911 he was appointed a member of the National Health Insurance Commission, but in 1913 returned to the Treasury as joint permanent secretary. In that capacity it fell to his lot to sign the currency notes issued by the Government when gold was withdrawn from circulation on the outbreak of the World War. Hence their first popular name of "Bradburys." He was made K.C.B. in 1913, and in 1919 was appointed chief British representative on the Reparations Commission. In 1920 he was given the G.C.B.

BRADDON, MARY ELIZABETH [MRS. JOHN MAXWELL] (1837–1915), English novelist (*see* 4.369), died at Richmond, Surrey, Feb. 4 1915. Among her latest novels were *The Green Curtain* (1911) and *Miranda* (1913).

Her son WILLIAM BABINGTON MAXWELL (1866–), born June 4 1866, became known as a novelist and newspaper correspondent. His novels include *Vivien* (1905); *The Guarded Flame* (1906); *Mrs. Thompson* (1911); *The Mirror and the Lamp* (1918); *A Man and his Lesson* (1919) and *A Remedy against Sin* (1920). He served with the Royal Fusiliers during the World War (1915–7) and attained the rank of captain.

BRAGG, SIR WILLIAM HENRY (1862–), British physicist, was born at Wigton, Cumb., on July 2 1862 and was educated at King William's College, Isle of Man. He subsequently entered Trinity College, Cambridge, being elected to a major scholarship in 1882. He was third wrangler in 1884 and in the following year obtained a first class in part III. of the mathematical tripos. In 1886 he was appointed professor of mathematics and physics in the university of Adelaide, S. Australia, where he carried out his earlier researches upon radioactivity. He took an active interest in the development of scientific enterprise in Australia, was a member of the council of the Adelaide University from 1893 to 1908, of the council of the South Australian School of Mines and Industries from 1895 to 1908 and president of the Australasian Association for the Advancement of Science, Brisbane, 1909. In 1909 he was appointed Cavendish professor at Leeds University, where he remained until his election in 1915 to the Quain professorship of physics in the university of London. His researches upon various radioactive phenomena and his power of lucid exposition brought recognition from scientific bodies both at home and abroad; in 1906 he was elected a fellow of the Royal Society; in 1915 he received the Nobel Prize for Physics and the Barnard gold medal (Columbia University), both of which distinctions he shared with his son William John Bragg (b. 1890), who in 1919 became

Langworthy professor of physics in the university of Manchester. The joint work of father and son has gone far towards elucidating the arrangements of atoms in crystals, an achievement rendered possible by their development of the X-ray spectrometer. During the World War Sir William Bragg's services were placed at the disposal of the Admiralty, where he served in an advisory capacity; he was more especially associated with the problem of submarine detection. His public services of a confidential nature were acknowledged by the bestowal of the C.B.E. in 1917 and by his creation as K.B.E. in 1920. In the same year he was elected an hon. fellow of Trinity College, Cambridge, and served as president of the Physical Society of London.

In addition to many publications, chiefly upon radioactivity, in the *Philosophical Magazine* and the *Proceedings* of the Royal Society, he has written *The World of Sound* (1920), a compilation of a series of lectures given to a juvenile auditory at the Royal Institution in 1919 and, in collaboration with W. L. Bragg, *X-Rays and Crystal Structure* (1915).

BRAMLEY, FRANK (1857–1915), English painter, was born near Boston, Lincs., May 6 1857. He studied art at Lincoln and later at Antwerp, first exhibiting in the Academy in 1884. Bramley became one of the best-known members of the group of English painters known as the Newlyn school, and in 1888 his picture, "A Hopeless Dawn," was bought under the terms of the Chantrey bequest. He became A.R.A. in 1894, and was elected R.A. in 1911, being also a gold medallist of the French Salon. He died at Chalford Hill Aug. 10 1915.

BRANDEIS, LOUIS DEMBITZ (1856–), American lawyer and jurist, was born in Louisville, Ky., Nov. 13 1856. He was educated in the public schools of his native city and at the Annen Realschule, Dresden, Germany. He graduated from the Harvard Law School in 1877, was admitted to the bar in 1878, and practised in Boston from 1879 to 1916. As a member of the Public Franchise League he took an active part in preserving municipal control of the Boston subway. He was instrumental in securing the passage of the Boston Sliding Scale Gas Act and was a pioneer in the movement for establishing life insurance through savings banks. He opposed the monopoly of transportation by the New Haven railway in New England. He was much interested in labour legislation, acting as counsel for the people in cases involving the constitutionality of fixing hours of labour and a minimum wage in several states. In 1915 he acted successfully as counsel for the Government in the suit brought by the Riggs National Bank in which the bank charged the Secretary of the Treasury and the Comptroller of the Currency with conspiring to wreck it. In Jan. 1916 he was appointed by President Wilson to succeed the late Justice Lamar as associate justice of the United States Supreme Court, being the first Jew to attain this position. He was the author of *Other People's Money* and *Business as a Profession*, besides numerous articles on public franchise, business efficiency, labour and trusts. He was prominent in Zionism and in 1914 was made chairman of the provisional committee for Zionist affairs.

BRANDES, GEORG MORRIS COHEN (1842–), Danish critic (*see* 4.427). The complete popular edition of his works was published in Copenhagen in 18 vols. between 1899 and 1910, and the German edition appeared in Munich in 8 vols. between 1902 and 1904. His later monographs include *Armand Carrel* (1911); *Goethe* (1915); *Voltaire* (1916); *Napoleon and Garibaldi* (1917) and *Caius Julius Caesar* (1918). He produced in 1919 a study of the Schleswig-Holstein question, *Sönderjylland under pröjsisk Tryk* (South Jutland under Prussian Tyranny), and a drama, *Tragediens anden Del. Fredslutningen.*

BRANGWYN, FRANK (1867–), English painter (*see* 4.430). Among his later works are decorations for the Courts of Justice, Cleveland, U.S.A., and the new Parliament building at Winnipeg, Canada. He also decorated the Court of the Seasons at the Panama-Pacific Exposition, San Francisco, and in 1921 was engaged on work for the State Capitol of Missouri at Jefferson City.

BRANTING, HJALMAR (1860–), Swedish statesman, was born in 1860. As a student he seemed at first destined for a scientific career. He early devoted himself to astronomy and for a period he acted as junior official in the observatory of Stockholm. His keen interest in political and social questions, however, soon drew him into journalism and into active politics, and he threw in his lot with the then small group of Social Democrats in Sweden. In 1886 he assumed control of the weekly journal *Socialdemokraten*, their leading organ, which later was converted into a daily. In 1888 he was condemned to a short term of imprisonment on account of his articles. He was elected a member of the Second Chamber of the Riksdag in 1896. An able speaker and tactician, he exercised in Sweden an influence proportionate to the growing numbers of his supporters. He joined the Eden Government in the autumn of 1917 as finance minister, and when this ministry fell in 1920 Branting became prime minister and formed an entirely Social-Democratic administration which, however, resigned office in the autumn of the same year (*see* SWEDEN). Meanwhile he had played an important rôle in international labour politics. He acted as representative of Swedish Social Democracy at all the congresses of the First International, and in the summer of 1917 he was chairman of the Dutch-Scandinavian delegation which sat in Stockholm and conferred in turn with delegations from the Socialist parties of most of the belligerent countries with a view to devising a platform for joint intervention by them in the interests of peace, the moving power being Camille Huysmans, the secretary to the International. Their efforts were unavailing. In Jan. and Feb. 1919 Branting was chairman of the International Social-Democratic Conference in Berne, at which British, French and Germans met for the first time since the war. He was a member of the executive committee of the Second International, which later sat in London with Mr. Henderson as its chairman. He had taken an active part in most of the Scandinavian workmen's congresses since 1886; and at the ninth congress in Copenhagen in 1920 he introduced the question of "democracy and dictatorship," the debate on which ended with the passing of a resolution by a solid majority, representing up to 800,000 organized worl men, against a small Norwegian minority, disapproving of the Bolshevik policy and adhering to the Second International.

Branting took a warm interest in the claim of the inhabitants of the Åland Is. to be allowed to decide the permanent position of the islands by means of a plebiscite, and he represented Sweden in this matter at the first attempt in Paris in 1919 to secure a decision from the Supreme Council, at the consideration of the problem by the Council of the League of Nations in London in July 1920, in Paris in Sept. 1920, and at Geneva in July 1921 (as Sweden's leading delegate). He was Sweden's leading delegate also at the first meeting of the League of Nations at Geneva in Dec. 1920 and chairman of the sixth commission which dealt with the questions of disarmament, of blockade and of mandates. He was elected by the Council a member of the "*Commission temporaire pour la réduction des armements*," for the carrying-out of which the commission made an appeal.

BRASSEY, THOMAS BRASSEY, 1st Earl (1836–1918), British politician (*see* 4.435), who was created an earl in 1911, died in London Feb. 23 1918. He was succeeded by his son, Thomas Allnutt Brassey (b. 1863), who died in London Nov. 12 1919. The 2nd earl left no children, and the title became extinct.

BRAUN, HEINRICH (1854–), German Social Democrat and writer on social questions, was born Nov. 23 1854 at Leipzig, and studied at Vienna, Göttingen, Berlin and Halle. He successively edited the important Socialist publications, *Die neue Zeit;* the *Archiv für soziale Gesetzgebung und Verwaltung; Die neue Gesellschaft;* and *Annalen für Sozialpolitik und Gesetzgebung*. After the revolution and the election of a Prussian Constituent Assembly, Braun was Minister for Agriculture in the Prussian Socialist Ministry formed under the presidency of Hirsch on March 24 1919.

Lily Braun (1865–1916), wife of the above, was one of the most remarkable women Socialists and writers of modern Ger-

many. She was the daughter of Gen. von Kretschmann, of an old East Prussian Junker stock, and was born at Halberstadt on July 2 1865. Her grandmother was the issue of one of the *amours* of Prince Jerome Bonaparte, King of Westphalia. Her whole early life was passed in a Junker and militarist atmosphere, on the East Prussian estate of her grandfather, or in the various garrisons where her father held command. She had a deeply introspective nature and read widely. The romantic as well as the social and ethical ideas which she developed contributed to alienate her from her class and her family and to draw her into the Socialist movement. Her first marriage (against the wishes of her family) was with an invalid socialistic professor, von Gizycki. After his early death she was attracted by the Socialist author and politician Heinrich Braun and married him in 1895. She visited England and was on terms of friendship with leading members of the Fabian Society. She was the author of many books and pamphlets on social questions, particularly on the place of woman in politics and industry, *e.g. Frauenfrage und Sozialdemokratie* (1901); *Frauenarbeit und Handwirtschaft* (1901); *Die Politik und die Frauen* (1904). But her most remarkable work was the story of her own life, told, like Goethe's autobiography, with some embellishments of fancy and, indeed, professedly in the form of a novel. The two volumes are entitled *Memoiren einer Sozialistin* (1) *Lehrjahre* (2) *Kampfjahre* (1909 and 1911). They give an elaborate picture, coloured no doubt by the intense self-consciousness of the writer, of the growth of the German Social Democratic movement in the 'nineties, with sketches of the leading figures, such as Bebel, Liebknecht, Rosa Luxemburg, and her own husband, Heinrich Braun. No German book brings out more clearly the nature of the cleft between the German and Prussian governing and military classes on the one side and the industrial masses and their leaders on the other. The contrast between German life in the country and in the cities is also vividly portrayed, as is the social life of a regiment and a garrison. Other books of hers are *Im Schatten der Titanen* (memoirs of her grandmother, who lived for a time in Goethe's circle); *Liebesbriefe einer Marquise;* a play, *Mutter Maria*, and a novel, *Lebenssucher*. She died on Aug. 8 1916.

BRAZIL (*see* 4.438).—No general census of Brazil had been taken between 1900 and 1920, but the total pop., estimated in 1908 at 20,515,000, was officially stated in 1917 to be 27,473,579. This figure, which is probably somewhat exaggerated, would give an average density of 8.3 per sq. mile. Estimates of municipal pop. in 1913 (probably not very accurate) were: Rio de Janeiro, 976,000; São Paulo, 400,000; Bahía (São Salvador), 348,000; Pará (Belem), 275,000; Pernambuco (Recife), 216,500; Porto Alegre, 150,000. The problem of immigration for so scantily peopled a country is a vital one. Its great fertile plains yield all the products of the tropics and sub-tropics, and it has immense wealth in natural resources, yet its forests are almost untouched, its enormous mineral deposits scarcely tapped, while grazing and agriculture are still far behind their possible development.

Vast regions in the interior are still unsettled, and some even unexplored. The most notable geographical achievement of the decade 1910–20 was the expedition made in 1914 by Theodore Roosevelt, in conjunction with Col. Rondon and other Brazilian officers, down the Rio Duvida (River of Doubt), of which by far the greater part had never been visited. The personnel of the expedition included, besides Theodore Roosevelt, his son, Kermit Roosevelt, two biologists, an engineer and a surgeon. The journey, interrupted by many portages, involved a distance of 470 m., and lasted two months, from Feb. 27 to April 26. After four days' progress down stream, cataracts were met with, and the next 60 m. took 42 days to accomplish. The river proved to be a tributary of the Madeira, some 940 m. in length, and joined the main stream in lat. 5° 20′ S. The general course, though very tortuous, is due N. running through rugged, densely wooded country almost devoid of animal life. It is now officially known as the Rio Roosevelt. In *Through the Brazilian Wilderness*, Roosevelt gave the credit for the discovery to Col. C. M. da Silva Rondon and to those associated with him on the Telegraph Commission during their six years' work before his own journey.

The number of immigrants registered during the years 1908–19 was as follows:—

1908	94,695	1914	82,572
1909	85,410	1915	32,206
1910	88,564	1916	34,033
1911	135,967	1917	31,192
1912	180,182	1918	20,501
1913	192,683	1919	37,898

Of the total 926,312, for the period 1908–16 inclusive, 354,820 were Portuguese, 190,767 Spaniards, 153,950 Italians, and 33,578 Germans. There were also 49,477 from Russia (chiefly Poles), 41,534 Turko-Arabs, and 21,843 from the Slavic parts of Austria. No racial statistics for 1917–9 are available. In 1911 arrangements were concluded with Japan to allow the immigration of Japanese agricultural labourers into São Paulo, and over 13,000 entered in the next two years. The agreement was renewed in 1916 so as to permit the coming of 5,000 annually. Immigration was greatly retarded by the World War, and when Italy entered the conflict in 1915 not only did Italian immigration cease, but many Italian subjects in Brazil were called home for military service, with the result that the labour market was seriously depleted. It was estimated that 50,000 sailed from São Paulo alone. When the Armistice was concluded in the autumn of 1918, the Brazilian Government notified all consular agents in the country that to agricultural immigrants accompanied by families aid would be gratuitously supplied, including food, tools, medical treatments, freedom from duties on baggage, transport by rail or water, etc. Those settling in the Federal colonies would also be given employment to the extent of 15 days' work a month for each adult, and temporary quarters would be provided for such as desired to build dwellings. In 1921 difficult post-war conditions in Europe were rapidly turning the tide of immigration again in the direction of Brazil.

Agriculture continues the chief source of Brazil's wealth. The leading crop is *coffee*, of which it produces about four-fifths of the world's supply. Over half is grown in the state of São Paulo alone, the rest coming from the states of Rio de Janeiro, Minas Geraes and Espirito Santo. The average production is somewhat over 12,000,000 bags a year (bag = 60 kg. = 132 lb.), the harvest fluctuating greatly with varying climatic conditions. The following official figures are published for the years 1915-9:—

	Bags Exported	Value in Pounds Sterling	Per cent of Agric. Prod. Exported	Per cent of all Prod. Exported
1915	17,061,398	32,190,547	68	59
1916	13,039,145	29,280,694	63	52
1917	10,606,014	23,054,280	49	36
1918	7,433,048	19,040,764	42	31
1919	12,963,250	72,607,208	66	55

A constant effort is made to maintain the price, by imposing an additional tax on exports over a certain amount, by encouraging consumption through propaganda abroad, and in São Paulo by prohibiting further extension of coffee plantations. The Coffee Convention or Valorization Scheme of 1907 (*see* 6.647) was resorted to again in 1917. In 1907, when the planters of Brazil faced ruin owing to over-production, the state of São Paulo, supported by the Federal Government, and with funds borrowed largely from foreign bankers, bought up 8,000,000 bags and stored them for disposal in a more favourable market. When the World War broke out, coffee to the amount of 3,000,000 bags still lay in European warehouses, most of which was eventually taken over by the belligerent Governments. In 1917 the state of São Paulo, to stabilize the price which was threatened by a large crop and restricted markets, purchased about 3,000,000 bags, and constructed enormous warehouses for their storage on the docks at Santos. The destruction by frost of a large part of the 1918 crop saved the Government from an anxious situation.

The areas of cultivation of mandioca, corn, cotton, tobacco, sugar and cacao have all increased in recent years. Rice, once imported, is so extensively grown that imports of it have virtually ceased. Of cacao Brazil supplies the major part of the world's demand, most of the crop coming from the state of Bahía. The output increased from about 33,000 metric tons in 1910 to over 65,000 in 1919. *Sugar*, the country's principal export in colonial times, is produced largely in the states of Rio de Janeiro and Pernambuco. The entire crop in 1917 was reckoned at about 420,000 metric tons, of which 138,169 tons were exported. This last figure was unusual and due to the encouragement of war prices abroad. Brazil consumes most of its own supply, the normal export rarely exceeding 60,000 tons. With the continued introduction of modern milling machinery, the production of sugar should become one of the principal sources of national wealth. *Tobacco* is grown in various states, but especially in Bahía and Rio Grande do Sul. The Bahía product challenges in quality that of the Vuelto Abajo district of Cuba, and finds a ready market in Europe, while that of Goyaz and Minas Geraes is highly esteemed for cigarettes. The annual production of Brazil was placed in 1917 at 45,000 metric tons of which about 26,000 were exported.

Cotton is native to Brazil, and may be grown in all parts of the republic. The best cotton lands are in the centre and along the N.E. coast to the mouth of the Amazon, where the finest varieties produce a long silky fibre equal to the Sea Island or the Egyptian. Annual production is reckoned at from 90,000 to 100,000 metric tons, but the export of raw cotton, mostly to England, fluctuates widely from year to year. The best year of the period 1910–20 was 1913, when 37,500 tons were shipped abroad, worth over £2,300,000. The average in recent years has been about 5,000 tons. By a presidential decree of March 27 1920 a cotton service was established to investigate the properties of the soil and climatic conditions, create experimental stations, and provide the planters at cost with machinery, implements and fertilizers. With these measures of encouragement taken by the Federal Government, the increasing enterprise of individual firms and planters to improve conditions of production, and with more careful selection and standardization of the fibres, Brazil should some day become the world's greatest exporter of high-grade cotton. The only important wheat-producing state in 1921 was the southernmost, Rio Grande do Sul, which supplies about half of its own needs; but Santa Catharina, Paraná, and the high interior of the south-central states are also suitable for the cultivation of this cereal. *Stock-raising* advanced notably during 1910–20, especially in Rio Grande do Sul, but also in the states of Minas Geraes, Paraná, São Paulo, Rio de Janeiro and Matto Grosso. The industry is being put on a modern basis, packing plants of the latest design and of high efficiency are in operation or projected, and dairy products have become valuable. The first two packing houses in Brazil were established in the state of São Paulo, one with North American capital, the other with Brazilian. A packing plant has been completed at Rio Grande by the Companhia Swift do Brazil, and another in the city of São Paulo by the Companhia Armour do Brazil. Canning establishments have been erected at Rosario and Sant' Ana do Livramento, in the state of Rio Grande do Sul, and Rio de Janeiro now possesses cold-storage plants with large capacity. Official statistics of live stock in 1913 were as follows:—

Cattle	30,705,400	Goats	10,048,570
Horses	7,289,690	Sheep	10,549,930
Mules	3,207,940	Swine	18,400,530

The increasing importance of the cattle industry since 1914 may be gathered from the following figures:

Exports of Chilled and Frozen Beef.

	Metric tons	Value
1914	1	£ 62
1915	8,514	309,706
1916	33,661	1,414,460
1917	66,452	3,184,461
1918	60,509	3,246,359
1919	51,634	3,381,486

Exports of Preserved Meats.

	Metric tons	Value
1915	123	£ 8,201
1916	856	78,571
1917	6,552	514,695
1918	17,223	1,402,892
1919	25,398	2,447,095

Rubber is still the most important of the forest products of the republic, and ranks next to coffee in export value, although it is being rapidly overtaken by exports of meats and hides. Since 1910 the rubber industry has suffered severely from the competition of cheaper plantation rubber from the Orient, especially since the slump in the market following the artificial demand stimulated by the World War. The Federal Government in 1913 undertook, in coöperation with the state of Pará, an ambitious plan for the relief of the industry, involving reductions in export duties, developments of transportation facilities, and the establishment of an experiment station. But, although a few plantations have been created, there is as yet little improvement in the industry at large. The "rubber" state of Pará will probably be forced to direct its attention in part to the production of other crops, such as cereals, sugar, mandioca and various vegetable fibres.

The exports of Pará rubber and their value during the years 1915–9 were as follows:—

	Metric tons	Value
1915	35,165	£7,039,697
1916	31,495	7,496,386
1917	33,998	7,484,170
1918	22,662	3,998,770
1919	33,252	6,239,794

In Paraná the lumber industry, while still in its infancy, was making rapid progress in 1920. Two large saw-mills, recently erected and equipped with the most modern North American machinery, were cutting Paraná pine and shipping the product to other parts of the country and to Argentina. Cedar for the manufacture of cigar boxes was also being shipped from this state to Rio de Janeiro and Bahía. Brazil has very great wealth in fibre and wood-pulp for paper-making, especially in the huge pine forests of Paraná and Santa Catharina. In 1921 only common grades such as wrapping paper were manufactured, but enough newsprint could be produced to supply the entire republic and even neighbouring nations, as Argentina and Uruguay. Another valuable forest production of Paraná is maté or Paraguay tea, most of which is purchased by Argentina, Uruguay and Chile. Over 76,000 tons were exported in 1916, and 90,000 tons in 1919, representing a value of £1,885,000 and £3,200,000 respectively.

Minerals.—Lack of transportation and high export duties still serve to check the exploitation of Brazil's immense mineral resources. Gold and diamonds are now produced only in small quantities. Minas Geraes possesses considerable deposits of iron ore, which are being carefully examined by foreign experts, and plans are on foot for the erection of modern furnaces. The output of manganese ore, mostly in the states of Minas Geraes and Bahía, increased rapidly during the World War, rising to 532,855 tons in 1917, the major part going to the United States. The production of mica was also greatly stimulated, exports increasing from 51 tons in 1915 to 162 tons in 1918. The world's supply of monazite sand comes largely from Brazil, although its exportation declined during the World War. There are coal deposits in Rio Grande do Sul, Paraná, Santa Catharina and elsewhere, but most of it is of poor quality. In March 1918 the Federal Government offered assistance in the way of loans to coal-mining enterprises whose output exceeded 150 tons a day. Most of the coal used for industrial purposes is still imported from England and the United States.

Manufactures.—Factory products showed a marked development during 1910–20, especially after 1914 when the World War decreased the supply of goods from abroad. The city of São Paulo, rapidly becoming the chief industrial centre, claimed in 1920 over 350 factories, large and small, with an investment of about £25,000,000. But manufacturing is also very active in the states of Minas Geraes and Rio de Janeiro, especially where water-power is accessible. Some of Brazil's industries, such as cotton textiles, tobacco and sugar, are natural to the country as they consume raw materials produced at home; others are at present purely artificial, encouraged by the protective barrier of heavy import duties from which the Federal Government secures the larger part of its revenues. In some industries practically every item entering into the manufacture of their product comes from abroad. The textile industry has made greater progress perhaps than any other, chiefly in cotton goods, and in 1921 it accounted for about 40% of the total production of manufactured articles. In 1905 there were 110 cotton mills in Brazil, with 26,420 looms and 734,928 spindles, representing a capital of £10,384,000, and producing nearly 264,000,000 yd. of cloth. In 1915 there were 240 mills, with 51,420 looms and 1,512,626 spindles, £21,596,000 capital, and an annual production of over 500,000,000 yards. The whole of this native textile production is sold in Brazil, supplying over 80% of the fabrics used.

There are several large shoe factories in Rio de Janeiro and São Paulo. Brazil manufactures 97% of its footwear. Great progress has been made in the tanning industry but owing to the inferior quality of native hides the output is confined mostly to sole and belting leather. The grazing regions of Rio Grande do Sul, however, produce fairly high-grade hides, and with importations from Uruguay and Argentina the tanners have begun to turn out a good quality of leather which competes with imported stock. The principal tanneries are in or near Rio de Janeiro and São Paulo, but there are a number of small establishments in Rio Grande and Porto Alegre and in a few of the northern cities. In 1919 sole leather was exported to the value of £246,692. It seemed probable that within a few years Brazil would become a producer of rubber goods as well as of the crude "Pará." There were already in 1921 a few small rubber factories in Rio de Janeiro and São Paulo, doing an increasing business, and a North American rubber corporation was about to erect a large factory near Rio for the manufacture of tires.

Commerce.—The value of Brazilian imports and exports during the years 1910–9 is shown in the following table:—

	Imports	Exports	Total
1910	£47,872,000	£63,092,000	£110,964,000
1911	52,822,000	66,839,000	119,661,000
1912	63,425,000	74,649,000	138,074,000
1913	67,166,000	65,451,000	132,617,000
1914	35,473,000	46,803,000	82,276,000
1915	30,088,000	53,951,000	84,039,000
1916	40,369,000	56,462,000	96,831,000
1917	44,510,000	63,031,000	107,541,000
1918	52,817,000	61,168,000	113,985,000
1919	78,177,000	130,085,000	208,262,000

Arranged by countries of origin or destination, the figures for 1916–9 are given in the tables on the next page. The effect of the rise in prices is shown, of course, in the period after the war started; and this superficially neutralizes to some extent in money-value the effect of the restrictions on over-sea trade. The jump in the figures from 1918 to 1919 represents the freeing of commerce combined with the rise in prices, particularly in the case of France, America and Great Britain.

India	552,500	—
Sweden	294,500	658,000

Among the leading imports of Brazil are iron and steel manufactures, machinery, railway supplies, coal, kerosene, cement, cotton goods, foodstuffs, and raw materials and articles for use in the arts and industries.

The principal ports of entry are Rio de Janeiro and Santos, but Pará, Pernambuco, Bahía, Porto Alegre and Rio Grande have a large and increasing foreign trade.

Shipping.—The Brazilian merchant marine increased but slowly in 1910–20, except for the German steamers seized during the war. Brazilian shipping in 1911 consisted of 238 steamers of 130,582 tons net, and 290 sailing vessels with a net tonnage of 60,728. At the end of 1917 there were 405 steamers of 236,535 tons net, and 54 sailing ships representing 17,920 tons net. Brazil in that year took over all the German ships interned in her ports at the outbreak of war in 1914, a total of 45 vessels with a net tonnage of 148,255. Thirty were leased to France, the rest turned over to the Lloyd Brasileiro, which considerably expanded its foreign service, especially to the United States.

Communications.—The railways of Brazil, aggregating 13,271 m. of track in 1910, had increased in 1917 to 17,159 m., with 2,223 m. under construction and 4,697 m. projected. The states having the greatest railway mileage were São Paulo, Minas Geraes, Rio de Janeiro, Rio Grande do Sul and Bahía which together contain over 70% of the mileage of the republic. One of the most extensive systems is the Central of Brazil, a Government-owned and operated property, connecting the federalized district with the states of Rio de Janeiro, São Paulo and Minas Geraes. The total length of the line in 1917 was 1,466 miles. In that year it carried 32,639,600 passengers, 2,388,000 tons of freight, and 530,000 head of live stock.

Owing to the wide separation of the principal centres of population along the coast, Brazilian railways have developed as a series of independent systems. Thus Pernambuco became the focus of one system, Bahía, Rio de Janeiro, Santos, and Rio Grande do Sul of others. For some time the need was recognized of connecting the various systems by interior lines running N. and S., to afford communication independently of the sea, and to stimulate internal settlement and trade. Such plans have been carried out N. and S. of Pernambuco (from Natal to Marció), and from Rio de Janeiro N. to Victoria and S. to the Uruguayan frontier, where connexion was made in 1913 with Uruguay Central. It is therefore possible to travel by rail from Rio direct to Montevideo, a distance of 1,967 miles.

Construction, however, was not limited to the coastal region. In 1916 a line of considerable importance was completed between Itapura on the Paraná river and Porto Esperança near Corumbá on the Bolivian frontier, the principal city of the state of Matto Grosso. The resulting direct rail connexion with the state of São Paulo reduced the time between Rio and Corumbá to six days, in place of a trip by water of from six to eight weeks. Extensions of the Rio system northwestward into the state of Goyaz and of the system of Ceará were planned or under construction in 1921. The Madeira-Mamoré line, passing round the dangerous falls of the Madeira river, was practically completed in 1912. Driven through deep forest in a deadly climate, it is one of the most costly railways in the world. It is 182 m. in length and of great importance for the Acré territory and Bolivia.

In 1909 there were 36,199 m. of *telegraph* reported in Brazil which had increased to 41,799 m. in 1917, of which 24,640 m. belonged to the Government. In the latter year 680 telegraph offices were reported, and 33 radio stations. The station at Pará (Belem) has a range of 4,000 m., and is thus capable of direct communication with the United States. The station at Cape Santa Marta, with the same range, connects with Cape Town in South Africa. In 1911 a new trans-Atlantic cable was completed between Monrovia (Liberia) and Pernambuco, and in 1919 an American-controlled connexion established with the United States, via Argentina and the W. coast. Brazil has now three cable lines connecting with Europe, two with North America, and two with the River Plate. The number of post-offices in the republic in 1918 was 3,611. Brazil from Jan. 1 1914 adopted standard time and the longitude of Greenwich.

Finance.—The following official figures are reported for 1919:—

National debt, Foreign . . .	116,281,960 pounds sterling.
National debt, Internal . .	1,042,000,000 milreis paper.[1]
Currency in circulation . . .	1,709,113,473 milreis paper.
Conversion fund	20,922,410 milreis gold.
Guarantee fund	48,391,020 milreis gold.
Unredeemed bills and notes, gold and paper	14,632,500 milreis.
General taxes for 1920 . . .	119,452,949 milreis gold; 514,258,200 milreis paper.
Estimated expenditure . . .	72,372,326 milreis gold; 599,578,557 milreis paper.

Army and Navy.—The *army* is organized on the basis of compulsory military service between the ages of 21 and 44, under the terms of a law promulgated in Jan. 1908. The service required is two years with the colours, seven in the reserve, seven in the second line, and eight in the national guard. By a decree of Dec. 1917 the national guard is incorporated with the second line. The total strength of the active army in the autumn of 1918 was 54,000, but mobilization would yield about 120,000. There is also a gendarmerie of 26,000.

The Brazilian *navy* in 1920 comprised two Dreadnoughts, two coast defence ships, three protected cruisers, two river monitors, four river gunboats, four small cruisers, four torpedo boats, ten destroyers, a mine ship, three submarines and a submarine salvage vessel. Five destroyers and three large submarines were under construction. The personnel comprised about 13,000 men.

Education.—The latest figures available in April 1921 gave the number of primary schools in the republic at about 13,000, with an enrolment of over 700,000. Of these schools about half are supported by the state Governments, one-fourth are municipal, and the rest private institutions. Secondary and normal instruction is cared for by various institutes and private establishments, of which there are between three and four hundred attended by some 40,000 pupils. The republic also possesses 28 industrial schools, 11 agricultural and 9 commercial schools. To further industrial education the Federal Government may aid the state Governments, or municipal and private schools which meet its requirements. Twenty-five faculties confer technical and professional degrees and those in the Federal capital have been recently organized as a university. A school of fine arts, a national institute of music, a military college, a naval academy and a preparatory school of tactics are maintained by the Government at Rio de Janeiro, and there are schools of art and music in a number of the states.

Political History.—Marshal Hermes da Fonseca, leader of the Conservative party and former Minister of War, was elected President of the republic in March 1910, over Snr. Ruy Barbosa. The latter part of the year was marked by serious disturbances in Rio de Janeiro and in the north. At Manáos, capital of the state of Amazonas, the governor was forcibly removed by the Opposition, aided by Federal troops and by the flotilla on the river, but was reinstated by order of the President of the republic. At Rio de Janeiro on the night of Nov. 22 the crews of two new Dreadnoughts, the "Minas Geraes" and the "São Paulo," mutinied in the harbour, killed several officers, and, training their guns on the city, sent a demand to the President for the abolition of corporal punishment, increased pay and shorter hours of labour. Four other ships joined the movement so that it included most of the Brazilian navy. As no response was received the city was bombarded next day, whereupon Congress granted the demands and passed an act of general amnesty. The mutineers meanwhile had put out to sea, but returned Nov. 27 and gave up the ships to the Government. On the night of Dec. 9, the marine corps stationed on Cobras Island in the harbour also mutinied. Their position was bombarded next day, the mutineers replying with shrapnel. After an action lasting ten hours, the rebels surrendered, having lost over 200 killed and wounded. The revolt was followed by reforms in naval administration, and by the dismissal of about 1,000 men. The Government had difficulty in 1912 in maintaining tranquillity, election disturbances occurring in the state of Bahía in Jan. which required the calling out of Federal troops, and in the autumn disorders threatened in the states of Paraná in the south and Pará in the north.

The death in 1912 of Baron Rio Branco, Brazil's most distinguished Minister for Foreign Affairs, withdrew an influential figure from South American politics. Through his efforts boundary disputes with several of Brazil's neighbours had been amicably adjusted and the territories of the republic considerably increased. He was succeeded as Foreign Minister by Dr. Lauro Müller. In 1913 a protocol was signed with Peru arranging for a commission to survey the frontier in accordance with the Treaty of Demarcation of Sept. 8 1909. On May 9 1913 the plenipotentiaries of Brazil and Uruguay agreed to a convention establishing a new frontier line between the two republics on the river San Miguel, and recognizing Brazil's navigation rights on that stream.

A perennial difficulty was that of national finance. In spite of annual messages of the President to Congress urging economy and the reëstablishment of a financial equilibrium, public expenditures increased in alarming proportion to receipts, resulting in heavy deficits. In 1913 the financial stringency was increased by a sharp decline in the price of rubber and coffee, and the result was an industrial and commercial crisis, intensified by the outbreak of the World War in 1914. A symptom of the financial situation was the failure of three railways in the rubber district, with liabilities of £5,000,000, held mostly by French investors. The war reacted seriously on most of the Hispanic-American countries, due to the fact that they had looked to Europe for their financing, and that the belligerent countries included those to which they had shipped a very large percentage of their raw products. In Brazil the reduction of exports and imports (the latter in the second half of 1914 were two-thirds less than in the corresponding period of 1913), and consequently of customs receipts, together with the closing of the European money market, came at a time when the Government was heavily obligated to local and foreign contractors. As a result the Government defaulted. In Oct. 1914 a funding scheme was announced by which interest on all foreign loans, excepting funding bonds of the 1903 loan, became payable in script for three years, and the redemption of nearly all securities was postponed for thirteen years.

The crisis was complicated by a rebellion in the state of Ceará in Feb. 1914, starting among the rubber collectors who could no longer obtain employment, and led by an ex-priest, Padre Cicero. It quickly reached such proportions that the Federal Government had to proclaim martial law and reinforce the Federal troops at Fortaleza, the state capital. The political opponents of the state president, Col. Rabello, apparently used the movement to get rid of him, and on the Federal Government's taking over the state administration the tension was somewhat eased. The rebels were disarmed and the region gradually quieted. Ominous signs of unrest at Rio de Janeiro at the time of the presidential election in March 1914 led to arrests and restrictions upon the press. As a result of the election, Dr. Wenceslão Braz, who had been vice-president under Marshal Fonseca, became head of the state.

Before the end of 1915 adjustments had been made to new conditions and the economic situation became more normal. New customers were found, especially in the United States, and the high prices prevailing throughout the world encouraged exportation. National expenditure was much reduced, the national revenue increased by over £6,000,000, and a small surplus appeared in the budget, a most unusual state of affairs for Brazil.

In the course of that year there were important developments in the relations of Brazil, Argentina and Chile, the three countries constituting what was already known as the A.B.C. Entente. Dr. Lauro Müller at the end of April paid official visits to the other two republics as well as to Uruguay, to bring about closer

[1] The paper milreis during 1920–1 varied between 5d. and 16d. or $ .10 and $ .32. The gold milreis is equivalent to 2s.3d. or $ .546.

diplomatic, industrial and commercial relations. On May 23 a treaty was announced in which the countries of the A. B. C. undertook to submit to an international committee any differences that might arise among them, and not to open hostilities until the committee had concluded its labours. The treaty was ratified by the Brazilian Chamber of Deputies in Oct. 1916. The A. B. C. in the spring of 1914 had offered its mediation in the dispute between the Government of the United States and Victoriano Huerta, provisional President of Mexico. In Aug. 1915 President Wilson invited the A. B. C. Powers, together with Uruguay, Bolivia and Guatemala, to enter into a conference on Mexican affairs, the result of which was the unanimous recognition of Venustiano Carranza as "chief of the executive of the *de facto* Government of Mexico." Brazil also took a prominent part in the Pan-American Financial Conference held in Washington in May 1915, in an attempt to better existing financial conditions in North and South America.

The administration of President Braz, which ended in Nov. 1918, was from a financial point of view very successful. He succeeded in reducing public expenditures, restored specie payment for internal debts, promoted the development of natural resources, and improved the economic relations between Brazil and her neighbours. Prices were high, but industry and commerce prospered, and the excessive demand abroad for Brazilian products so increased exportation that the country was left with the largest trade balance it had ever known. In the national elections of 1918 there was no contest, the sole candidate for the presidency being Snr. Rodrigues Alves, a native of São Paulo and senator from that state, who had been president of the republic in 1902–6. The president-elect, however, was too ill to be inaugurated in Nov., and died on Jan. 15 1919, without assuming office. Another election was held in April to fill the unexpired term, and Dr. Epitacio da Silva Pessôa was chosen. Dr. Pessôa was then in Paris as chief of the Brazilian delegation to the Peace Conference. On his return journey in 1919 he paid official visits to England, Portugal and the United States.

From the outbreak of the World War in 1914, popular sympathies in Brazil had been almost wholly on the side of the Entente Powers, in spite of some annoyance caused by the British "black lists." The German policy of unrestricted submarine warfare announced early in 1917 forced the nation to assume an active share in the conflict. On Feb. 8 the Brazilian Cabinet dispatched a strongly worded protest to Berlin, declaring that the proposed "blockade" was contrary to international law, and that Brazil would hold Germany responsible for any consequences that might ensue to Brazilian shipping. A similar note was sent to Austria. On April 4 the steamer "Paraná" was sunk by a German submarine off the coast of France and several of the crew drowned. On April 10, after an inquiry into the incident, the German minister at Rio de Janeiro was handed his passports. In the crisis Dr. Lauro Müller, minister for foreign affairs, resigned his portfolio, apparently feeling that his German name and antecedents might embarrass the Government. Snr. Nilo Peçanha, a former president of the republic, was appointed in his place. Rupture with Germany did not involve an immediate departure from neutrality, but with the sinking of another steamer, the "Tijuca," the drift toward war became more rapid. Late in May President Braz sent a message to Congress advising that neutrality be revoked, on the score that unity of action with the United States, now a belligerent, was a tradition of Brazilian foreign policy. On May 29 the Chamber of Deputies unanimously passed a bill authorizing revocation whenever the executive deemed the occasion appropriate. Congress also authorized the seizure of the German ships interned in Brazilian waters, aggregating nearly 150,000 tons. After the sinking of another vessel, the "Macao," a state of war was formally declared Oct. 26 1917. Many anti-German demonstrations took place during the year, especially in Rio de Janeiro, São Paulo and Rio Grande do Sul.

Brazil, considering her immediate resources, gave valuable aid to the Allied Powers. Although the larger units of the navy had not been entirely renovated by the time of the Armistice, destroyers and other small vessels saw active service on both sides of the Atlantic. Many physicians and a few aviators went abroad to be attached to the Allied armies. The Federal Government in Dec. 1917 also promulgated a new military law, by which all citizens of the republic between the ages of 21 and 30 were subject to selective draft. But up to the cessation of hostilities comparatively few had been called out, because the Government lacked the means for adequate instruction and equipment.

As a signatory of the Treaty of Versailles, Brazil was one of the original members of the League of Nations, and became one of the nine Powers represented on the League Council.

(C. H. H.)

BRÉAL, MICHEL JULES ALFRED (1832–1915), French philologist (*see* 4.481), resigned his chair at the Collège de France in 1905. He died in Paris Nov. 25 1915.

BREMEN, Germany (*see* 4.493). Pop. 311,266 according to the census of 1919; in 1910 it was 299,526. The economic life of the city state of Bremen in Germany was, in the period from 1908–14, in a state of high prosperity. The North German Lloyd attained its highest figures of emigrant traffic (107,124) in the first half of the year 1909. The number of emigrants carried was beginning to diminish about the year 1912. In the course of the years 1912 and 1913 the competition of the port of Emden, the construction of which had been completed by the Prussian State, began to make itself felt.

Bremen gradually passed from being a purely commercial city to a development as an industrial city, the result of which was to impose a heavy burden upon the finances of the city state. Towards the middle of 1913, conflicts of interest arose between the North German Lloyd and the Hamburg-Amerika line; the North German Lloyd chose the path of more unobtrusive development of its business. The prospects of shipping, and therewith the prospects of the business expansion of Bremen, had begun to deteriorate as far back as the beginning of the year 1914.

The effect of the war was to paralyze almost completely the trade of the city seaport. Bremen was the first of the German states to introduce a tax upon war profits (May 1915). Attempts to consolidate the maritime traffic led, in the year 1916, to the establishment of the Bremen association for the import trade. On Aug. 24 1916 Bremen celebrated the return of the mercantile submarine "Deutschland" from its successful voyage to New York.

Conflicts on the subject of the constitution began in April 1917. Bremen was the first town which, after Kiel, entered upon a revolutionary movement (Nov. 6 1918). The Workmen's and Soldiers' Council seized political power on Nov. 14. On Dec. 28 it was decided to arm the proletariat. This was followed, on Jan. 10 1919, by the formation of a Socialist republic of Bremen with a council of commissaries of the people. On Jan. 28 1919 the Government of the Reich sent troops to deliver Bremen from the domination of the communists. This force entered the city on Feb. 4 after protracted negotiations. Elections were held for the Bremen State Assembly on March 9, and a coalition government of the Socialist and non-Socialist parties was formed. The new constitution was passed on May 11 1920. It conferred upon the Senate (as in Hamburg) political and administrative powers. Side by side with the democratic Parliament the following representative bodies were likewise established:—A chamber of the working classes, a chamber of salaried employees, a chamber of agriculture, a chamber representing the retail trade, and a chamber representing the large commercial and wholesale interests. The constitution of Bremen contains a special declaration that the Church is separated from the State. (O. Kr.)

BRENTANO, LUDWIG JOSEPH [called Lujo] (1844–), German economist (*see* 4.496), was one of the German delegates sent over to London in Nov. 1919 to attend the economic conference convened by the "Fight the Famine" Council. At the first session of the conference, held at the Caxton Hall Nov. 4, he urged the organization and encouragement of German industry to enable Germany to fulfil her treaty obligations. His more recent publications include a pamphlet on the proposed League of Nations, and two short works, *Ist das System Brentano zusammengebrochen?* and *Russland, der kranke Mann* (both 1918).

BREST LITOVSK, BATTLES ROUND, 1915.—The operations round Brest Litovsk (*see* 4.500), from July 15 to Aug. 26 1915, formed an important part of Mackensen's campaign in Poland

in the north-eastern offensive of the Central Powers that year (*see* EASTERN FRONT CAMPAIGNS).

On the completion of the regrouping of Mackensen's group of armies, which now consisted of the Austro-Hungarian IV. Army, the German XI. Army, the German Army of the Bug and the Austro-Hungarian I. Army, the Central Powers had resumed the offensive along the whole front from the Bug to the Pilica. Mackensen, with three of the armies, was to direct the attack between the Vistula and the Bug. The main body of the I. Army was to coöperate in this attack on the eastern flank by delivering an assault in the direction of Vladimir Volinski, while the remainder of the army was to provide cover along the Bug up to the N. wing of the II. Army. The II. Army and the Southern Army were to cover the attack on the Upper Bug and the Zlota Lipa, and were themselves to attack only if this became necessary for the protection of the neighbouring armies or if the Russians showed signs of any dislocation of their forces. Woyrsch was to fall in with the IV. Army's offensive between the Vistula and the Pilica and, if occasion arose, to attack across the Vistula. Forcing the Dniester, the VII. Army was to push forward E. of the Strypa towards Czortkow and Buczacz, and to let its cavalry attack in force E. of the Sereth.

Battles of Sokal, July 15–24, and Krasnostaw, July 16–9.—On July 15 at 11 A.M. Mackensen's attack began. On the very first day Puhallo's army made its approach all along the Bug, which, in spite of the high water-level, was forced on the 16th by a division of the I. Corps N. of Sokal. By that time the Army of the Bug had obtained possession of the positions between Terebin and Grabowiec, and Arz's Corps, on the right wing of the XI. Army, had stormed the very obstinately defended positions at Skierbieszow. The Guard Corps and the XXII. Res. Corps won the heights to the S.W. of Krasnostaw. The IV. Army was working steadily up to the Russians' strong main position. In spite of the dogged resistance of the Russians the Guard of the XI. Army succeeded in taking Krasnostaw in the next few days, and in pushing on to the heights N. of the Zolkiewka. The I. Army meanwhile had taken Sokal, which was stormed by its I. Corps, and had constructed a bridge-head on the E. bank of the Bug. Farther N., Szurmay's group gained the right bank of the Bug at Zdzary, and, on the S. wing, portions of the II. Corps the E. bank at Krystynopol.

Mackensen's right flank now appeared to be adequately protected, but for the present the attack on Vladimir Volinski was impracticable, on account of the Russian counter-attacks which soon developed and the limited strength of the I. Army. West of the Vistula, Woyrsch and the army group of Kövess, which had been placed under him, had on the 16th begun an attack which led on the following day to the battle of Sienno of which the object was to break through the Russian lines.

On the 18th this attack ended in a complete victory. The Russian IV. Army evacuated its positions along Woyrsch's whole front, and retired to new defensive positions behind the Jlzanka and S.W. of Radom. But here again the Russians were unable to stand against the powerful forward push, and were thrown back beyond Zwolen by the right wing after heavy fighting. While Kövess on the 20th was occupying Radom and advancing victoriously along the E. bank of the Pilica, the front N. of Zwolen was successfully pierced over a stretch of 2 km., and the Russians were driven back to the Vistula and to a kind of bridge-head position S.W. of Ivangorod. But on the same evening Woyrsch broke through these positions also, E. of Zalasy and at Czarnolas, and took possession of the heights at Janowiec. All attacks launched by the Russians from the fortress zone at Ivangorod proved fruitless. Farther N. the Russian II. Army, being pursued by the German IX. Army, fell back on Grojec and Blonie and the defences of Novo Georgievsk.

The successful battles of the XI. Army, the obstinate attacks by the IV. Army, and, not least, Woyrsch's menacing position on the left bank of the Vistula, induced the Russians, although they had obtained all the reënforcements available, to retreat on the 19th. Pursued by the Army of the Bug, the IV. and the XI. Armies, they once more took a firm footing in new and well-prepared positions on the heights N. of Grubieszow, Rozana, Gardzienice, and N. of the Chodel, thus covering the railway line Ivangorod–Lublin–Chelm. In the days that followed they made all possible efforts, reënforced by the XIII. Rifle Div., to drive the Austro-Hungarian forces at Sokal back across the Bug, but all their attacks, vigorous as they were, failed. All their assaults against the fronts of the XI. Army and the Army of the Bug—whose right wing had gained ground beyond Grubieszow towards the N.—were also unsuccessful, and they were driven back from the heights N. of the Chodel by the IV. Army along a front of about 40 kilometres.

The general effect of these successes on the allied attack was to bring about a short pause in the fighting. The Russians had established themselves in strong positions, and brought up fresh forces. It seemed equally urgent to overhaul the allied forces, and fresh preparations were also necessary before the renewal of the attack. While the pause lasted the allies strengthened their positions against new Russian counter-attacks.

Within the next few days the right wing of the Army of the Bug pushed forward up to the carriage road running from Horodlo to Wojslawice. The Russians renewed their embittered attacks on the bridge-head at Sokal, but without any success whatever. Certain portions of the I. Army succeeded in taking the obstinately defended height of Gora Sokal. The II. Army was able to establish its 32nd Infantry Div. to the E. of Kamionka Strumillowa on the right bank of the Bug.

Meanwhile Woyrsch's army was making due preparations for the crossing of the Vistula. Kövess's group, the XII. Corps and the 7th and 9th Cavalry Divs. remained beside the Vistula from Janowiec to the Pilica estuary, while the Landwehr Corps with the Bredow Div. moved behind the left wing of the army. Aided by the self-sacrificing efforts of the Austro-Hungarian and German pioneers, who suffered many losses through the heavy artillery fire, the Landwehr Corps and the Bredow Div. crossed the river on the 28th in five places between Kobylnica and Tarnów, fighting fiercely, and established themselves at Maciejowice on the opposite bank.

Battles of Chelm (Kholm) and Lublin: Capture of Ivangorod and Warsaw (July 29–Aug. 4).—On the 29th the offensive was resumed on Mackensen's whole front. The main blow on Biskupice was to be delivered by the XI. Army, on whose right the Army of the Bug was to continue the attack on Chelm. The IV. Army was to coöperate with the attacking group of the XI. Army by pushing its strong right wing through to Lublin.

The assault, led by Gen. von Emmich, broke through the Russian front in the battle of Biskupice (July 29–30), and an advance was made to beyond Olesniki, where the right bank of the Wieprz and the bridge of the railway leading to Chelm were taken. North of Krasnostaw the Guard Corps joined in the battle, but without winning any immediate success. The IV. Army was for the time being able to come only as far as the Russian wire entanglements.

In consequence of the reviving offensive, and also probably of the ever-increasing pressure of the German armies on the Bobr–Narew front, the Russians once more evacuated their positions E. of the Vistula early on the 30th, their only stand against the pursuit being made at Grubieszow. The XVII. Corps of the IV. Army, after overcoming the seven-fold wire entanglements, made five successive assaults on the Russians during the night of the 30th. In the afternoon the cavalry of the XVII. and IX. Corps rode into Lublin unopposed. The XIV. Corps advanced to the heights N. and N.E. of the town, and the IX., X. and VIII. Corps captured the heights S. of Snopkow and approached the road running through Markuszów Konskowola and Nowo Aleksandrya. On the following day these successes were everywhere extended by violent fighting. In the IV. Army the German 47th Res. Div. at Kurow flung itself across the road named above, and the left army wing reached Nowo Aleksandrya.

On Aug. 1 the Russians continued their retreat step by step, losing heavily. They also left the Bug below Krylow. In the

pursuit Puhallo's whole left wing pushed forward over the Bug below Zdzary, and up to the hollow S. of Ustilug. The Army of the Bug established itself along the Bug from this point to Dubienko, while the Beskiden Corps, fighting on its left wing, pursued the Russians beyond Chelm. The XI. Army came upon fresh opposition in the line Kulik-Leczna, and in front of the IV. Army the Russians were able to maintain the positions to which they had retired after the abandonment of Lublin.

West of the Vistula great events were in preparation at this time. Kövess's Transylvanian troops captured, by a vigorous attack on Aug. 2, eight concrete entrenchments on the front of Ivangorod, of which four were taken by the 50th Infantry Regt. The Landwehr Corps, too, penetrated into the enemy's positions at Domaszew. The successes of this group assumed for the Russians an ever more threatening aspect. On the one hand the railway between Warsaw and Ivangorod would be in serious danger if the Landwehr Corps pushed their advance any farther; on the other the enveloping of Ivangorod's N. front would admit of considerable pressure being brought to bear on its defenders.

In the next few days Mackensen's group of armies by their tenacious attacks ousted the Russians from one position after the other. The forces of the Russian III. and IV. Armies, which were being hemmed in more and more closely, tried in vain by counter-attacking to obtain breathing space and relieve the pressure.

While Mackensen continued his irresistible advance between the Bug and the Vistula, and Prince Leopold of Bavaria and Woyrsch were on the point of taking Warsaw and Ivangorod, there were signs in the N. also that the fortresses on the Bobr-Narew front were doomed. Pultusk and Rozan had been taken by Gallwitz's Army, and Ostrolenka was seriously threatened. Farther N. the VIII. Army (Scholz's) was equipping itself to attack Lomza and Ossowiec, while the X. Army (Eichhorn's) and Below's Army of the Niemen were advancing on Kovno and Riga. The Russians were, no doubt, considering the abandonment of their front on the Vistula; and they had begun to send off their war material and the enormous food supplies needed to support the armies during a retreat which was to be only gradual. But in spite of all the strength they displayed they were being constantly forced backward. On the 3rd, Leczna was captured by the left wing group of the XI. Army. The cavalry of the I. Army entered Vladimir Volinski, and Szurmay was nearing the Luga. Aug. 4 crowned all previous successes. The German IX. Army under Prince Leopold of Bavaria threw the Russians out of both the outer and inner ring of Warsaw's forts, and, after the Russians had evacuated the town and withdrawn to Praga on the right bank of the Vistula, made their entry into the town. Simultaneously the western quarter of Ivangorod on the left bank of the Vistula was taken by the XVI. Infantry Div. of Kövess's group, while the garrison retired to the right bank and blew up the Vistula bridge.

The IV., XI., and Bug Armies, continuing the pursuit, forced back the Russians, in spite of violent resistance, behind the line Sawin-Baranowka-Kurow. The left wing of the IV. Army advanced to the heights N. of Konskowola.

The Battle at Lubartow, Aug. 5-8.—When the Russians began their retreat from the Vistula position between Warsaw and Ivangorod it fell upon Mackensen to deliver his blow on the left flank of the retreating army. His desire was to push forward with all possible speed beyond Parczew to the railway line running from Warsaw to Brest Litovsk. The I. Army and the Bug Army were to cover the attack by holding the bridge-heads constructed on the E. bank of the Bug. The Bug Army removed its right wing to Dubienka and was to advance with its left on Wlodawa and across the Wlodawka. The IV. and XI. Armies, whose attacks were to be continued, were to reach the Tysmienica and Wieprz section as quickly as possible. As a guiding line for the inner wings of both armies Mackensen selected the river bed of the Wieprz.

The shifting of the XI. Army, which now became necessary, was made possible by the transference of the Beskiden Corps from the Bug Army to the rear of the XI. Army's right wing. The troops occupying the stretch of the Bug below Ustilug could now gradually loosen their hold, for here the Russians, under pressure of what had occurred, were retiring by successive stages on Kovel. They were being pursued for the moment only by the I. Army cavalry.

On the IV. Army devolved the task of attacking the strong positions at Lubartow within the next few days. By the 6th it was able to take the Russian trenches S. of that place, and at Brzostowka and Krasny German troops penetrated into the Russian positions. On the 7th the decisive blow was given by the attacking group on the army's right wing, composed of seven divisions of the XIV. and XVII. Corps, commanded by Lt.-Field-Marshal Roth. The enemy was driven out of several lines, lying one behind the other, during the morning, and in the afternoon and evening this group, with the XLI. Honved Infantry Div. and the XI. and III. Infantry Divs., pushed their way to beyond Firley, driving a wedge into the Russian front. The Russians fell back in complete disorder across the Wieprz. Meanwhile the X. Infantry and XLV. Light Infantry Divs. had crossed the Wieprz to the N.E., at and N. of Baranówka, in order to join in the battle of the XI. Army, which was also being assisted by heavy artillery fire in the direction of Brzostowka. West of the Rudno-Kamionka road the XVII. and IX. Corps also joined in. Here the Russian XXV. Corps had advanced from the area S. of Michów to a counter attack on the Austro-Hungarian X. Corps, which after a hard struggle succeeded in forcing the enemy back to the Lower Wieprz and snatching from him some of his *points d'appui*. The immediate effect of these battles was the evacuation by the Russians of the Vistula bank N.W. of Ivangorod also. Thereupon Kövess and Woyrsch took up the pursuit on both sides of the Sololew-Zelechow road. On the 8th and 9th the pursuit of the hurriedly retreating enemy was vigorously carried on. The IV. Army crossed the Wieprz close to its estuary and also at Leszkowice. On the 9th, too, the Bug Army and the XI. Army penetrated the enemy's lines at several points after extremely heavy fighting, but on the 10th they again encountered the greatest resistance.

Woyrsch and Kövess crossed the Warsaw-Lublin road and went in pursuit of the Russian IV. Army, which was falling back on Łuków and Radzyn. The Archduke Josef Ferdinand's Army now advanced also on the N. bank of the Wieprz, and, on the 10th, reached the region N.W. of the Lower Tysmienica and the area in the bend of the Tysmienica; the Emmich group, fighting on the left wing of the XI. Army, approached the Upper Tysmienica in its pursuit of the Russian IV. Army's left wing. On Woyrsch's left were the German IX. and XII. Armies, the latter of which, coming from Gallwitz's Army, had penetrated to the Bug and the area of Sadow, Kaluszyn, and Ceglow. Up to Ossowiec all the fortresses of the Bobr-Narew line had fallen. Novo Georgievsk alone still held out, but around it Gen. von Beseler was drawing his siege-ring ever closer.

The Brest Litovsk Offensive.—The IV. Army's flank attack on the Russians retreating castwards had in the last few days changed into a frontal pursuit in a north-easterly direction, carried out in conjunction with Prince Leopold of Bavaria's group of armies. For the XI. and Bug Armies, however, Mackensen still held to the proposed flank attack, to be delivered in a northerly direction.

The S. wing of Hindenburg's group of armies (the German VIII. and XII. Armies) and the two groups of Prince Leopold of Bavaria and Mackensen were forcing back the Russian main force ever farther towards the Bialystok-Brest Litovsk railway line. This main force was composed of the XII., I., II., IV., and III. Armies, and counted roughly 60 infantry and 7 cavalry divisions. Mackensen's part in the great scheme of operations was to attack the southern portion of this section of the railway, which had the support of the powerful Brest Litovsk fortress. Within the area which it sheltered, down the Bug as far as Janów, the Russian III. Army, with about 14½ infantry and 2 cavalry divisions, made its retreat, while the Russian IV. Army took the direction of Janów and approached the Bug from the north-west. On the 12th the III. Army, between the Bug and

the Tysmienica, gave up the resistance and fell back step by step through Macoszyn, Hola and Parczew, followed by the XI. Army and the left wing and centre of the Bug Army. The right wing of the IV. Army remained in the bend of the Tysmienica, the centre and left wing crossed the Bystrycza and came towards the Bialka section and Radzyn. Kövess and Woyrsch advanced by way of Luków and Siedlce.

As the offensive progressed the allies' front had become considerably shorter. For whereas the length of front in the middle of July, at the beginning of the offensive, had been about 720 km. long from the German VIII. Army's left wing at Ossowiec to Mackensen's right wing, it had by the middle of Aug. been curtailed to the extent of 480 km. The armies drew closer together, and it thus became possible to relieve the fighting troops more frequently and also to withdraw whole corps and throw them into the battle at another point.

On the 13th the vigorous pursuit S. and W. of Brest Litovsk gained considerable ground. The IV. Army advanced in the general direction of Biala, the XI. steered straight for Brest Litovsk and fought its way to the region round Opole, and the Bug Army pushed forward its left wing as far N. as Hanna on the Bug. On the following day the Russians offered renewed resistance, but fell back again still farther early on the 15th, after the Guard Corps, reënforced by the XIX. Infantry Div. and the X. Reserve Corps, had penetrated their lines S.E. of Razwiedowka and at Gorodyszeze respectively on the 14th, and the IV. Army had also successfully attacked their positions. The German X. Corps came in to reënforce the ever-lengthening front of the Bug Army and, taking up its position on the army's right wing, undertook the protection of the Bug in conjunction with the I. Army at Dubienka.

On the 15th the XI. and IV. Armies reached to Tuczna and the area S. of Biala in their pursuit. The left wing corps of the Bug Army gained the cross roads N.W. of Slawatycze. Early on the 16th portions of the IV. Army crossed the Krzna hollow and established themselves N. of the road leading westward from Biala. To the N. of the IV. Army Prince Leopold of Bavaria's group of armies, with Woyrsch's Army and the Kövess group, reached the Bug N. of Konstantynow, and the IX. Army crossed over in the direction of Leniatycze.

On the 17th the XI. Army had come up so near to the outlying positions of Brest Litovsk that the Guard and the Austro-Hungarian VI. Corps, who were to invest it, could now move into the blockade position S.W. of the fortress on the line Okczyn-Dobrynka-Lachowka. The X. Reserve Corps established itself E. of Janów on the Bug, and the XXII. Reserve Corps pushed in between that corps' right wing and Lachowka on the front facing east. At Wlodawa the Bug Army built out a bridgehead. The main body of the IV. Army was echeloned N.W. of Janów and crowded together on the S. bank of the Bug. The left wing was opposite Niemirów, where the VIII. Corps was fighting its way across the Bug. Adjoining was Kövess, who had taken the N. bank of the Bug between Niemirow and Mielnik, and was continuing the advance in conjunction with Woyrsch and with Prince Leopold of Bavaria's group of armies, which had reached Zerdycze.

The Bug Army, to which Arz's Corps had been added, and which now stretched as far as Krzna with its left wing, took the offensive across the Bug in a N.E. direction starting from the Wlodawa area. In the battle of Wlodawa the German I. Infantry Div. broke through the Russian positions on the 19th and pushed forward, followed by the XXII. Infantry Div. to Piszcza. The XXIV. Reserve Corps attacked Dubok and Czersk—for the time being without success. At Slawatycze on the E. bank of the Bug the Russians put up a very strong resistance. They were concerned at this point to delay the advance as long as possible.

The Russian XXIX., XXIII., and II. Caucasian Corps were to take advantage of the protection of the lakes E. of Wlodawa to bar the approach to Brest Litovsk. But the retreating movements of their train columns, and the withdrawal of troops in the general direction of Kovel, Kobryn and Pruzany, pointed to a fight to gain time, which would have to be cut short by the I. Army and the Bug Army in a vigorous attack. On the N. wing of the Bug Army no change took place that day as regards the Russian positions at Brest Litovsk, but the XI. Army gained ground N. of the Krzna in the direction of Kolczyn. The Russians attempted, by repeated counter-attacks, to delay the pressing pursuit of the allies until they should have had time to cross the Bug. The IV. Army succeeded in advancing as far as the Pulwa.

In face of the right wing attacks of the Bug Army the Russians had established themselves on the 20th along the Kapajowka. Arz's Corps, before Brest Litovsk, forced the Russians back on both sides of the road leading from Biala to the fortress, to beyond the area N. of Dobrynka. In the zone of the XI. Army the angle of the Bug at Krzna was almost completely cleared by the XXII. Corps. The X. Reserve Corps pushed across the Bug at Ogorodniki without meeting with any great opposition. The Archduke Josef Ferdinand's Army and the Kövess group encountered renewed violent resistance on the line Wolczyn-Wolka-Tymianko. After hard fighting the Russians were driven farther back. The investing troops of Brest Litovsk also gained some ground.

On the 22nd the XLI. Reserve Corps of the Bug Army, after making their way through the lake defiles, reached the region E. of Oriechowo, and on the 24th, together with the XXIV. Reserve Corps, advanced to the line Zbunin-Mielniki after fierce fighting. The Beskiden Corps and Arz's Corps meanwhile were working their way step by step up to the particularly powerful positions and forts of Brest Litovsk. The XXII. Reserve Corps and the X. Reserve Corps of the XI. Army were also fighting hard to repulse the Russian counter-attacks. On the 24th Arz's Corps and the Beskiden Corps succeeded in penetrating the Russian lines in several places and in forcing back the Russian garrison (III. and V. Corps) behind the permanent ring of forts. In the meantime the XI. Army, fighting furiously, advanced over the Bug to the line Neple-Minkowice, and threatened the fortress from the north. Meanwhile the XII. Corps of the Kövess group had broken through the Russian front, already greatly shaken, at Riasno, and had wrested from it the Pulwa position. A vehement fighting pursuit was carried out by the IV. Army and Leopold of Bavaria's Army group as far as Minkowice-Babinka. The S. wing of the German XII. Army pushed forward with the IX. Army to the swampy valley of the Orlanka.

Capture of Brest Litovsk (Aug. 25-6).—On the 25th the XXXIX. Honved Infantry Div. of Arz's Corps broke through the outer ring of forts at Kobylany, S.E. of the railway leading from Biala, and took the fort from the rear. The positions on both sides of the road coming in from Biala were also stormed. The XII. Infantry Div. of this corps captured a fort S. of Koroszczyn, and the XXII. Reserve Corps took the place itself and several forts on the N. front of the fortress, after which the Germans advanced to the railway bridge and drove the Russians back into the citadel.

Farther N. the Guard Corps and the X. Reserve Corps pushed the Russians back to the Lesna, which river was crossed by the Guard Corps on the 25th to the N. of Brest Litovsk. The IV. Army and Prince Leopold's group beat the Russians back to Kamieniec Litowsk and the Lesnaja marshes.

After the hard battles fought on the 25th around the forts of the fortress, which culminated in the capture of the redoubt by the XXII. Reserve Corps and Arz's Corps, the Russians, on the 26th, abandoned the fortress and withdrew to the Ryta and the Muchawiec section, closely pursued by the Bug Army and the XI. Army. In the Bug Army the XLI. Reserve Corps and XXII. Infantry Div. pushed forward on both sides of the road from Wlodawa to Kobryn, to beyond the road leading E. from Brest Litovsk. Gerok's Corps gained the Ryta section, and the Beskiden Corps, advancing along both sides of the road from Brest Litovsk to Kobryn, reached the Szebryn region. The VI. Corps remained in the fortress and was once more put under the XI. Army command. The XI. Army advanced in the area

N. of Brest Litovsk as far as the line Saki–Poliszcze, and by hard fighting drove out the Russian rearguard. In the IV. Army, portions of the XXXVII. and XLI. Honved Infantry Divs. had occupied a sort of bridge-head position E. of Kamieniec Litowsk on the Lesna. The main body of the army (the VIII. and XVII. Corps) concentrated at Monaczki and Zadworzany in readiness to withdraw bodily from the front as soon as its troops stationed E. of the Lesna should be relieved.

The fall of the Brest Litovsk fortress and the simultaneous capture of Bialystok by the German VIII. Army compelled the main force of the Russian N.W. front to retreat.

The Austro-Hungarian I. Army's Offensive at Kovel (Kowel).—The arrival of the reënforcements transferred from the IV. Army (the IX., X., and XIV. Corps) to the I. Army gave the signal for a renewed offensive advance by the I. Army. If an advance in the direction of Kovel were made, and the Russians were driven E. and W., the result would be to divide the Russian N.W. from the S.W. front. The impassableness of the Polesie, lying between the two fronts, was an appreciable aid to this separation. The offensive was opened on the 19th against the Russian XXXI. and IV. Cavalry Corps by Heydebreck's Cavalry Corps, of which the Austro-Hungarian IV. Cavalry Div. reached the Dubienka area and the XI. Honved Cavalry Div. the locality of Luboml. On the 20th, in a further advance, the German V. Cavalry Div. reached Bobly, and the Austro-Hungarian IV. and XI. Olesk and Ruda, while infantry detachments of the IX., X., and XIV. Corps followed, moving concentrically up to Mokrec and Luboml.

On the following day the Russian XXXI. Corps took up a position to meet them on the line Turyjsk–Nowosiolka–Ruda, whereupon the whole II. Infantry Div. was brought forward to Solowicze. On the 22nd, together with the Cavalry Corps, it engaged in fierce fighting at Maciejowa and Turyjsk, and drove back the XXXI. Corps on Kovel. The main body of the Russian XXXI. Corps attempted to join the Russian III. Army to the N. by way of the Pripet. The Russian IV. Cavalry Corps was aiming at a similar junction through Kamien Kaszyrskiy. In their retreat the Russians had undertaken a regrouping of the N.W. front's S. wing in the area N. and S. of Polesie. The XIII. Army, which had been fighting on the S. wing, was disbanded. The army command with three of the corps were transferred to other fronts, and the remaining four corps incorporated with the III. Army defending Brest Litovsk.

On the 24th the German V. Cavalry Div. and the Hungarian XI. Honved Cavalry Div. took up the pursuit to the N., the IV. Cavalry Div. to the east. The separation of the N.W. from the S.W. front had been accomplished. Up to the end of Aug., Mackensen, who after the fall of the fortress had again been placed under the Supreme Army Command, carried the pursuit up to Kobryn and Pruzany; Prince Leopold of Bavaria's and Hindenburg's S. wing (the XII. and VIII. Armies) advanced along the roads to Wolkowica and Grodno on to the line Pruzany–Jalówka–Nowinka Nowydwor and Sopockinie, and the Austro-Hungarian armies attacked the S.W. front together with the German S. Army.

On the 25th the Austro-Hungarian IX. Corps of the I. Army had begun an enveloping advance against the N. wing of the Russian VIII. Army. On the 26th their offensive was in full swing. The XIV. Corps and the IV. Cavalry Div. advanced on Zydyczyn from Kovel, the IX. and X. Corps won the area N. and N.W. of Lokaczyn by fighting, and Szurmay's N. wing crossed the Bug at Markostaw. By the end of Aug. the main body of the Archduke Josef Ferdinand's army, which had been set at liberty N. of Brest Litovsk, had been brought over to the N. wing of the I. Army. On the arrival of the army command, the two armies, under the Archduke's Higher Command, continued the offensive begun by Puhallo against Luck and Dubno. The advance which followed, with which the II. and Southern Armies were associated in their attack across the Zlota Lipa, led to the Rovno campaign. (E. J.)

BRETON, JULES ADOLPHE AIMÉ LOUIS (1827–1905), French painter (*see* 4.501), died in 1905.

BRIAND, ARISTIDE (1862–), French statesman (*see* 4.515). Few men in France had gained so much in political knowledge, ability and influence, during the 15 years preceding 1921, as Aristide Briand. The year of the separation of Church and State (1905) marked his entry into the ranks of the coming men in France. His tolerant interpretation of that measure, his desire to bring about a cessation of the bitter strife between old Radicals and the growing body of men who, while remaining Conservative, nevertheless accepted the Republic, marked him out as a man capable of interpreting the signs of the times. At the age of 59 Briand had been seven times prime minister of France. He was first Minister of Public Instruction in the Sarrien Ministry of 1906, and maintained that portfolio in the succeeding Clemenceau Government until Jan. 1908, when, still under Clemenceau, he became Minister of Justice, a portfolio which he resigned to become prime minister on July 24 1909. After a reshuffle he continued as prime minister from Nov. 3 1910 until Feb. 27 1911. He again took office as Minister of Justice in the Ministry formed by Raymond Poincaré on Jan. 14 1912. He followed Poincaré as prime minister between Jan. 21 1912 and Feb. 18 1913, and retained that office under Poincaré's presidency until March 18 1913. He was Minister of Justice in the Viviani war Cabinet from Aug. 26 1914 until Oct. 29 1915, when he again became prime minister, remaining in office until March 20 1917. He succeeded Georges Leygues as prime minister on Jan. 16 1921. (*See* FRANCE: *History*.)

By his eloquence and the suavity of his manner Briand earned for himself many soothing nicknames, such as the "charmer," the "siren" and the "*endormeur*." He had in his command a voice of pleasing resonance and yet capable of humour, and a wealth of gesture and a knowledge of histrionics acquired from his friend the great actor Antoine. These, with a handsome and dominating personality lightened by a very ready and supple intelligence, explain his countless successes at the tribune. They were reinforced by statesmanlike qualities of courage and firmness, and a proper appreciation of the right moment at which to strike or to stroke recalcitrant sections of the community. M. Briand struck hard when, in 1910, he mobilized the railwaymen and thus put an end to the most grave labour trouble that had yet threatened France. Leaving far behind him the bitter doctrines of class warfare from which he started, Briand, in speeches at Perigueux St. Chamond, appealed to the country to breathe the atmosphere of appeasement, to accept the clerical struggle as over, and to work unitedly on sane measures of social reform. He was, in these utterances, seeking to create a centre party of moderate Republican sentiment. The constant labour troubles and the dangerous pandering to the greed of labour which had marked previous Radical administrations made his task easy. It was upon this Republican centre that Briand based his majority. His chief work was done during the World War. He succeeded Viviani at a time of considerable difficulty. The first battle of the Marne had been won, but the second was still to come. He had ambitious desires to bring about the unification of allied war effort which Clemenceau and events alone had the power to achieve. It was under his influence that the first steps towards coördination were taken. He had to fight against the French Parliament's desire to play a greater part in the conduct of the war than that to which it was entitled. He had also to support in conference against British representatives the claims of the Salonika expedition. As Minister of Foreign Affairs he was largely responsible for the entry of Rumania into the war. In 1921 France gave him her confidence as being exceptionally qualified, by suppleness of character and firmness in argument, to maintain her claims for national *security* amid the difficulties encountered in enforcing the Peace Treaty. He attended the Disarmament Conference at Washington in Nov. 1921, and stated the case for his country. (G. A.)

BRIDGE, AUCTION (*see* 4.531).—As the game of Bridge had succeeded Whist among card-players, so in turn after 1908–10 did the first form of simple or "straight" Bridge give way to Auction Bridge—but the second step was the more complete, for

while Whist is still played, "straight" Bridge practically died at Auction's birth. Even before 1908 it had long been recognized that the great weakness of "simple" Bridge was the restriction of the trump-making power to the dealer and his partner, and their inability to evade that privilege at will—a ruling which enforced the playing of too many poor hands and the forfeiture of too many good ones. Hence arose the plan of putting up every hand to auction, forcing the dealer to open the bidding, allowing every player a chance to buy the declaration (naming at each bid the suit which he desired to play), and selling it to the highest bidder (or to his partner in the event of that partner having been the first to name the final suit, in which case the second partner was considered merely the "raiser," not the bidder). Bidding continued until three successive players had passed in lieu of bidding, doubling or re-doubling; any player might abandon his original suit and switch to a new suit, to his partner's suit, or even to his adversary's. The bidding having closed, the partner of the buyer became dummy, and the buyer's left-hand adversary became the leader. At first the original suit-values and ranks were retained as at "straight" Bridge, but many vital changes were made. The rubber-bonus was raised to 250. The adversaries of the buyer (hereafter called the Declarant) were debarred from scoring points toward game ("below the line"), taking their profits invariably in the honours-column at 50 a trick regardless of suit. The book for the declarant remained at six; over that he had to take as many tricks as he had bid; if he took more, he could score them all; if he took fewer, he could score nothing except for possible honours—his adversaries scoring 50 for each trick stolen from the contract. The book for the adversaries varied with the size of the bid, being always the number of tricks that the declarant dared lose; it was determined by deducting the bid from seven—in a 2-bid the adverse book was 5, in a 3-bid 4, and so on. In a doubled hand, the adversaries scored 100 for each trick over their book, in a re-doubled hand 200. But if a declarant who had been doubled succeeded in keeping his contract, his trick-points were doubled, he received a 50-point bonus in the honours-column, and an additional 50 points for every trick over contract; if he had re-doubled, each of these 50's was raised to 100, and his trick points went to four times their normal value. Doubling was restricted to one double for each side.

All these points remained in the game as played in 1921, but meanwhile the next move after 1910 was to change the suit-values—competition in the market-place having proved their too great discrepancy, and having shown also that a good spade hand was invariably wasted. The dealer being still forced to bid, his solace for a poor hand was provided by spades at 2 a trick and a stop-loss of 100 honour-points, while good spades were to be bid as "lilies" or "royals" and at 9 a trick. The suits thus ranked: clubs 6, diamonds 7, hearts 8, royals 9, and no-trumps 10—with the merely nominal spade at 2. All went well until certain American players seized the chance to use the low spades as codes, telling their partners the exact make-up of their hands without assuming proper responsibility or risk. It was thus that the first "false" bids appeared. A system of high-spade bids came into vogue in American play ranging from 2 to 7 inclusive, and forming a code ("6 spades," for instance, meant "Partner, take your choice between hearts and no-trumps; I can play either." The point value being but 12, the partner was enabled to make a comparatively low safe bid). Though this became known temporarily as the "American" game about 1912-3, the sobriquet was really unfair to the majority of American players. These false bids received no support in England and they were equally anathema to the majority of American players, though accepted by all the contemporary American writers on the game except one. Miss Florence Irwin immediately waged a vigorous war upon them, and the result was that the system was killed. To accomplish this end, however, the game had to be re-made. Spades at 2 vanished, and spades at 9 took the place of royals, the latter term disappearing. The dealer's refuge in the case of a poor hand thus having been removed, the forced opening bid was also abolished. Three successive passes still closed the bidding, except in the case of three opening passes, when the fourth player was still given his chance to bid. An entire hand might be thrown. It was thus that the game continued to be played in 1921.

Certain variants were experimented with during 1913–21, but without disestablishing the recognized game of Auction. "Nullos" were an early variant, their object being to destroy the undue advantage of high cards. The nullo-player had to *lose* tricks on a poor hand—a much harder thing than to win them on a good one. The idea had long been discussed but had been deemed impossible, as no player could contract to lose all the tricks while carrying an exposed dummy of whose make-up he knew nothing when bidding. Miss Irwin evolved the plan of allowing 6 *safe* tricks to the bidder of 1 nullo, 5 safe tricks to the bidder of 2 nullos, and so on. She became an ardent champion of this difficult and scientific variant, collecting a large following. Mr. Robertson of England also wrote an extremely deep and clever book on nullos, adding much to the sum of knowledge concerning them. But it was a losing fight; the nullo game was far too difficult for most people. Another variant appeared in America under the name of "Pirate Auction," but it never received any official recognition, and died almost before it lived. More support was given in some London and Paris clubs to "Contract Auction" of which the essential point is that no more tricks can be scored toward game than the declarer has contracted to make, a special system of scoring, different from that of ordinary Auction, being adopted; but in 1921 it had still failed to penetrate beyond a limited circle.

In American play, the method of false-bidding was meanwhile revived under the form of a false double. On this system to double any low bid is not meant as a genuine double, but operates as a code. The person who doubles a one-trick bid in any particular suit practically says, "Partner, I have a no-trumper except that I do not stop that suit. Do you?", while the person who doubles one no-trump says, "Partner, I, too, have a no-trumper. Bid 2 in your best suit, for I have general assistance." But here again it would be quite unfair to call this the "American" game, although it is very commonly practised by American players, for many of the best American authorities have been opposed to it. English players had, up to 1921, declined to adopt any such code.

The American laws have always followed the English laws in substance, with one important exception: in England, the total of a bid must exceed the total of the previous bid, or must equal it and contain more tricks: in America, it is merely necessary to equal it with new tricks, or to out-bid it in number of tricks regardless of total value. Thus in 1921, in England, it was still necessary to bid 5 clubs (=30) to out-bid 3 no-trumps (=30) and 6 diamonds (=42) to out-bid 4 spades (=36); whereas in America, 4 clubs and 5 diamonds would suffice. The American laws have also reduced the revoke-penalty to 50 and abolished "chicane," as having no place in a bidding game; and they make a touched card in dummy a played card. The latest English laws, up to 1921, were drafted in 1914; the latest American in 1920.

Hints to Players.—A minimum first-round opening bid is: 5 trumps with ace or king at the top, worth 7 points (counting every honour two and every plain card one), *and* an outside ace or guarded king. A first-round bid that is not an opener may (in the case of great trump-length) dispense with the outside trick. Later-round bids may dispense both with that and with top-trumps; their great requisite is length. No-trumps are bid on three stopped suits (an ace and two guarded honours, two aces and one guarded honour, or even four or more guarded honours without an ace). After an adverse suit-bid, the no-trump bidder must be able to stop that suit.

To raise his partner's bid once a player should hold one "trick" and one "raiser"; to raise it twice, one "trick" and two "raisers"—and so on. A "trick" is any one of three things, and a "raiser" is any one of five—those same three and two additional. "Tricks" are: guarded trump-honours, *or* side-aces, *or* side-kings, guarded. And "raisers" are: guarded trump-hon-

ours, *or* side-aces, *or* guarded side-kings, *or* singletons, *or* blank suits. A plain singleton is one raiser, a singleton ace or a blank suit two raisers each. The "trick" and the first "raiser" should lie in different suits.

The bidder makes his bid, and then counts his losers (reckoning all "guards" as losers and the things which they guard as takers). His partner announces as many *necessary* raisers as his hand warrants. The bidder then deducts his partner's takers from his own losers, and knows how high a bid the combined strength warrants. *Count losers to bid and takers to raise or double.*

No one should double the only bid he can defeat. No one should double any very low bid, nor one that affords an easy means of escape to his quarry. A doubler should hold *the sure book in his hand* (trusting his partner for the odd) and should be practically sure that his double affords his enemy no probable means of escape.

The declarant's scheme of play in any declared trump is to exhaust the adverse trumps and then to make his side-tricks; he foregoes this trump-exhaustion only in the case of a cross-ruff between his two hands, or a quick ruff in dummy. The adversaries' scheme in declared trumps is to make quick aces and kings.

The declarant's scheme in no-trumps is to hold up the control of the adverse suit or suits, and to establish his own as soon as possible, remembering that "length is strength in no-trump." The adversaries' scheme is to withhold as long as possible the controlling card or cards of the declarant's suits, seeking meanwhile to establish their own best suit.

Quick tricks are the motto in declared trumps, slow tricks and continual "hanging-back" in no-trumps. (F. I.)

BRIDGE, FRANK (1879–), English musical composer, born at Brighton Feb. 26 1879, was musically educated at the Royal College of Music, which he entered as violin student in 1896, but gained a scholarship for composition three years later. For many years subsequently he was equally in demand both as composer and as viola player, in which latter capacity he was quite first-rate. Often he was called upon to play the viola in quintets with the Joachim Quartet. Bridge was at one time or other a member, as violist, of the Grimson and the Motto quartets. A vast number of songs were produced by him, but it is as a composer of chamber music for strings that his reputation stands. In this category there are four quartets for pianoforte and strings or for strings alone and a sextet; a phantasy trio; a quartet in E minor, which was crowned by an honourable mention at Bologna in 1906. His sonnet, *Blow out, you bugles*, has been sung ubiquitously. Among the other works of real importance are his orchestral compositions, *Isabella* (1907); *Dance Rhapsody* (1900); a suite, *The Sea* (1912); *A Dance Poem* (1914); a suite for stringed orchestra and *A Lament* for the same; a tone-poem, *Summer*. As a conductor Bridge also established his reputation. In 1910–11 he conducted at the Savoy theatre for Marie Brema, and was at Covent Garden with Beecham in 1913.

BRIDGE, SIR FREDERICK (1844–), English organist, composer and conductor, was born at Oldbury, Worcs., Dec. 5 1844. Educated at first at the Cathedral school, Rochester, where his father was a vicar-choral, he became a chorister there in 1850 and 15 years later assistant organist. In 1865 he became organist to Trinity church, Windsor, in 1869 to Manchester cathedral, and in 1875 he was appointed permanent deputy organist to Westminster Abbey. In 1882 Bridge succeeded Turle as organist and master of the choristers at Westminster Abbey, a post he retained until 1918, when he retired with the title of emeritus organist. In 1890 he was appointed Gresham professor of music; in 1896 conductor of the Royal Choral Society; in 1902 King Edward professor of music in London University. He was knighted in 1897, received the M.V.O. in 1902 and was promoted C.V.O. nine years later. Belonging to what has come to be regarded as the "old school," but remaining a popular figure as the organizer of important musical functions, Bridge was a voluminous composer, especially of church music. He has written about a dozen oratorios and cantatas, many successful glees and part-songs; primers on counterpoint, organ accompaniment and musical gestures. Also he published *Samuel Pepys, a Lover of Music* (1903); *A Shakespearean Birthday Book* and an autobiography, *A Westminster Pilgrim* (1919).

BRIDGES, ROBERT (1844–), English poet (*see* 4.532), was in 1913 appointed Poet Laureate. Among his later publications were *Ibant Obscuri* (1916) and an ode on the *Tercentenary Commemoration of Shakespeare* (1916); as well as an *Essay on Keats*, several addresses on poetical subjects, and occasional poems during the World War. He also edited *The Spirit of Man* (1916), an anthology in English and French. In the summer of 1920 he originated a letter, subsequently signed by many Oxford tutors, lecturers, professors and some heads of colleges, addressed to the learned world of Germany and intended as an *eirehicon*, which was published in the autumn. Its advisability was the occasion of much difference of opinion in academic and other circles.

BRIDGING, MILITARY (*see* under PONTOON, 22.69).—At the beginning of the 20th century all the armies of the civilized Powers were equipped with pontoon trains of various forms. The European continental nations all had steel boat-shaped pontoons varying in size from the large German bipartite pontoon, which had about 8 tons effective buoyancy, to the Italian high-prowed pontoon specially suited for the swift current of the rivers in that country and capable of carrying lorries when two pontoons were placed stern to stern, and the French and Belgian pontoons, which were somewhat smaller than the British. The British army adhered to the bipartite wooden boat shaped pontoon, 21 ft. over all in length, 5 ft. 3 in. beam, and 2 ft. 5 in. in depth, with a maximum effective buoyancy, when immersed to within 6 in. of the gunwale, of about $4\frac{1}{2}$ tons. The advantages of the wooden pontoon with waterproof canvas skin, as proved by the South African War, were lightness, quietness for night work, and the ease with which bullet holes could be plugged, or holes caused by shell splinters repaired. On the other hand, the steel pontoons undoubtedly stood the rough handling of active service better, and did not suffer like the wooden pontoons when they had to be stored in the open under a hot sun. They can also be more readily manufactured in large quantities in war-time, whilst the difficulty of obtaining a sufficient supply of thoroughly seasoned material greatly hampered the rapid expansion of the British bridging trains. Taking all considerations into account it seems probable that the next pontoons designed for the British army will be of galvanized steel, somewhat larger and appreciably deeper than the present pattern.

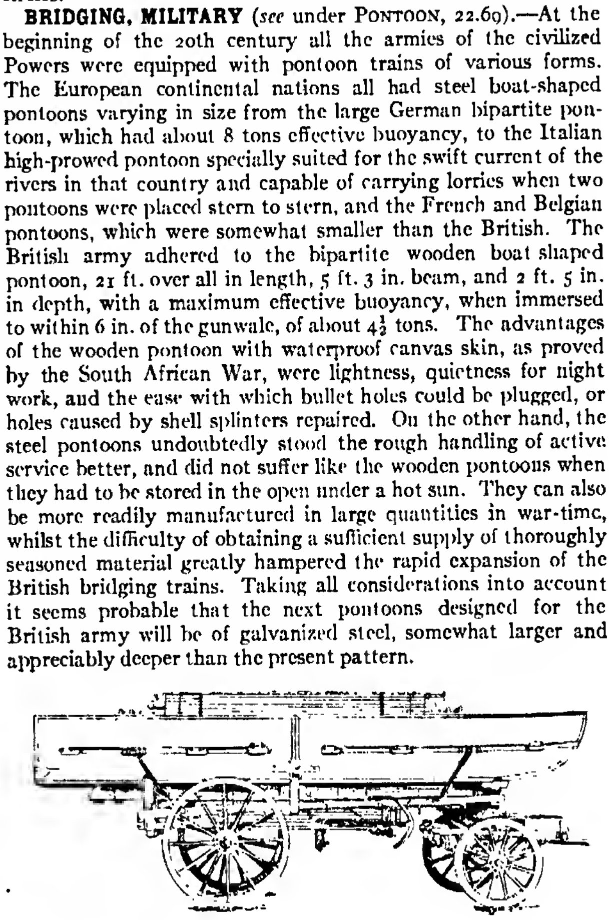

FIG. 11.

The British pontoons (as shown in fig. 11) were made in two sections, the bow section having its gunwale rising towards the bow, and the body curved and tapered forward, so as to reduce the force of the current against the bridge The stern section was rectangular in form, so that two pontoons could be coupled together stern to stern, or any number of sections could be coupled together to form rafts capable of bearing the weight of the heaviest gun carried in the field. Figure 12 shows the various uses to which the pontoon sections are put in forming light, medium, or heavy bridge. Normally when packed for travelling (as in fig. 11) and when used in the normal form of light bridge designed to take a column of infantry in fours, field guns, and horse transport, the bow and stern sections were coupled together as one pontoon, which could be lifted off its carriage and launched by sixteen men gripping the handles at each side. The wagons carried also the superstructure of timber roadbearers (or "baulks"), which fit on the saddles of the pontoons to form the bridge, "chesses" or planks forming the roadway, and "ribands" or wheel-guides which hold the ends of the "chesses"

secure and form the curb of the roadway. In addition to the pontoon wagons a bridging unit always included wagons carrying adjustable timber trestles known as "Weldon trestles." These were an important part of the equipment, being used to form the piers of the bridge in shallow water near the bank where the pontoons could not float, or to make a landing-stage when the pontoons were used as rafts on a wide river, or without the pontoons to bridge the narrow streams or dry gaps.

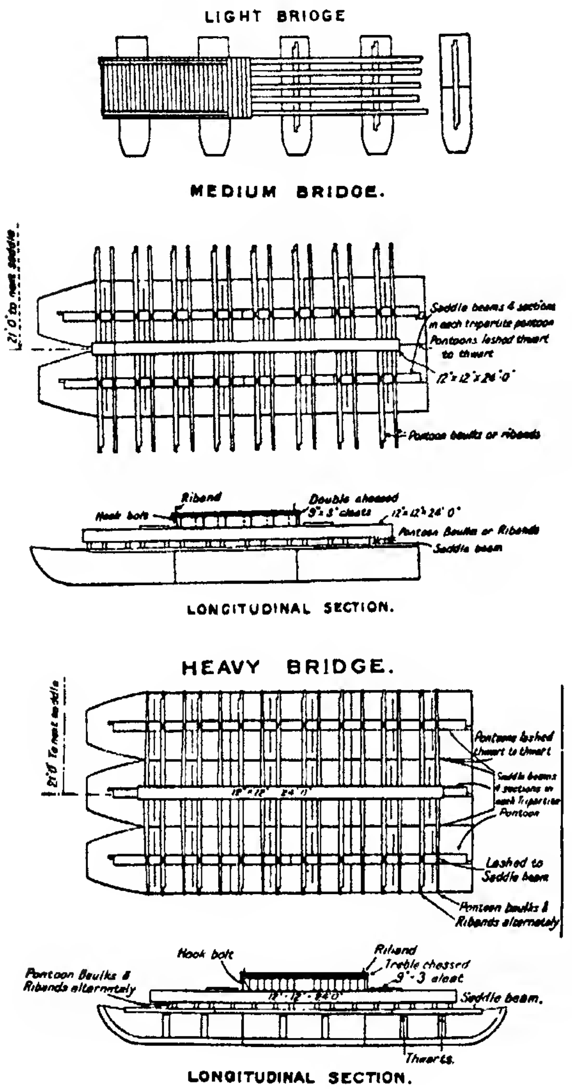

FIG. 12.

In the organization of a British division of 1910–14 were included two, and in the division of 1915 three, "Field Companies Royal Engineers," each of which, besides its other military engineering equipment, included two pontoons and one trestle wagon, the latter carrying two trestles; the three wagons among them carried also five bays of superstructure for light bridge, using five baulks to a bay.[1] This gave every division the means of crossing a river independently, the engineers being able rapidly to form three bridges up to about 75 ft. in length, or one bridge of about 200 ft.; if used to form bridge of half-pontoons capable of carrying infantry in file and pack animals, the equipment could be extended to bridge about double this width.

Bridging trains moving in rear of the army carried each 42 pontoons and 16 trestles with superstructure, as a reserve for the crossing of wide rivers, and these were later supplemented with a superstructure of heavy steel joists, so that the pontoon equipment could be used to form medium and heavy bridges to carry mechanical transport and the heaviest guns and tractors on the road. The pontoon trains were originally drawn by horses, but to save the great number of horses a pontoon train requires, and to give greater mobility, some were adapted for mechanical transport. These consisted of "four-wheel-drive" lorries, each trailing two pontoon or trestle wagons, and were able on good roads to cover much greater distances in less time than the horse-drawn bridging trains.

The "Field Squadrons Royal Engineers" attached to cavalry divisions were equipped with a lighter form of collapsible boat, and each cavalry regiment was provided with an air-raft equipment. A special cavalry bridging train equipped with small steel pontoons was provided for use in Egypt and Palestine. These forms of bridging equipment could take the lighter natures of transport accompanying a cavalry brigade, including horse artillery guns.

On the other hand, the British army when it took the field in 1914 had no reserve of heavy bridge equipment, nor any of the portable steel-girder bridges which were found so invaluable later in the war.

The British army, unlike most European armies, had no specialized bridging units. All the field units of the engineers carried out the annual course of bridging as part of their normal duty. This course was held wherever possible on the banks of a tidal river, and work was mainly concentrated on the pontoon drill which enabled the sappers to handle the material with great celerity. But the training also included practice with various forms of light improvised bridges, and the crossing of rivers by means of barrels, tarpaulin rafts, spar and timber trestles, and the construction of light suspension bridges. Little was done in the way of heavy bridging, but all units were taught the use of spars as derricks and sheers for launching girders and moving heavy loads, and a certain amount of pile-driving and heavy trestle work was done. The officers' theoretical course included the design of timber and steel girder bridges of all types, and some gained practical experience in bridging works in India and elsewhere abroad in the course of their employment in peace on the public works. Never, however, before the World War of 1914–8 had the problem to be solved been of such a varied and complex nature. The immense advance in the use of mechanical transport of all kinds, from motor-cars to steam traction engines, the greatly increased weight of artillery in the field, and finally the coming of the tank, demanded the use of heavy road bridges not far short of railway bridges in strength.

On the other hand, owing to the ease with which destruction can be carried out by means of modern explosives, advancing troops were more frequently than ever before confronted with the problem of crossing a river or canal when all existing bridges had been destroyed, approaches broken up by explosives, and the river and its environs defended by artillery and machine-gun fire. In such a case pontooning was clearly impracticable, and other means had to be devised by which the infantry could be given a footing on the opposite bank to form a bridge-head to cover regular bridging operations.

For these fighting bridges, which were practically the most important because without them no advance could be made, no standard equipment existed. Each field company improvised its own solution to the problem after reconnoitring the crossing to be forced. Usually the material could only be carted to within a mile or so of the site, and had to be carried by hand the remaining distance across shell-pitted ground, or marshland intersected by dykes. Lightness and extreme portability were thus essentials of the design. Then the material might suffer from shrapnel fire whilst *en route* or when lying hidden behind a bank or wall, and might be pierced by machine-gun bullets whilst actually

[1] The length of bridge section between two points of support technically called a "bay" is normally 15 ft.; thus a bridge supported on the two shore transoms, with piers formed of two pontoons and two trestles, would consist of five bays equal to a span of 75 ft. The width of the roadway of the bridge as normally formed is 9 ft. clear between ribands.

being placed, hence strength and impermeability were required. Lastly, the bridge had to be put together in the dark in perfect silence, exposing as few sappers as possible on the bank, so that simplicity and interchangeability of parts were essential.

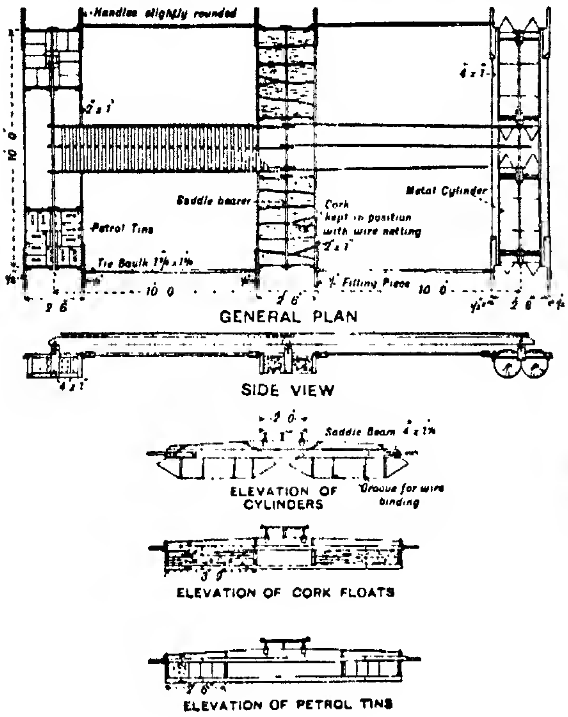

FIG. 13.

The lightest and least vulnerable pattern evolved was probably the cork-float footbridge with light wooden footboards hooked over the saddles of the float and interlocking. A pattern of this type is shown in fig. 13, which also shows the employment of captured German canister floats and of petrol tins to support these light foot-bridges. A petrol-tin raft was used by the engineers of the British 25th Div. for the crossing of the Sambre-Oise canal near Landrecies in 1918; in this case each raft consisted of two floats each of eight petrol tins laid flat and built into a wooden crate for carriage. Eighty of these rafts were carried for 3,000 yd. under fire to the canal bank, and each when launched carried across a man with full equipment. When sufficient men had been ferried across by this means to secure a foothold on the far bank the rafts were connected by light foot-boards to form a bridge 55 ft. in length.

A form of light ferry-boat which was very useful was made as shown in fig. 14 by tying the standard-size waterproof trench shelter, or bivouac sheet, measuring 13 ft. by 10 ft., over a light wooden framing made in parts for easy transport. In the little boat thus formed six men could squat, and be pulled across by a rope worked by a sapper who had swum to the far bank or paddled across in the first boat, another man on the near bank pulling the empty boat back; and considerable numbers of infantry could thus be put across even before a light footbridge could be constructed. The boats also formed a very serviceable footbridge when connected together as illustrated in fig. 3 (plate). In a case where a crossing could be effected at a canal lock or other point where the width to be spanned was not more than about 20 ft., a light trussed timber bridge was built up complete, and carried or rushed forward from under cover on wheels, and launched across the gap by the sappers, somewhat as a fire-escape is handled. Similar devices have often been used in the storming of a fortress for the crossing of the ditch. A notable example of this method was the crossing at a lock on the Sambre-Oise canal made by the British 1st Div. on Nov. 4 1918.

Another notable piece of front-line work was the construction of a *crib causeway*, built of railway sleepers bolted together and sunk in the bed of the river, to carry tanks across the river Selle in the first line of the assaulting troops (1918). This was kept just below water-level for concealment, and was built in the nights just preceding the attack under the nose of the enemy holding the opposite bank.

As soon as a foothold on the opposite bank has been gained by the infantry, and the enemy's machine-guns put out of action, the next step for the engineers is to establish the crossings more strongly so that pack-animals can be got across with ammunition and supplies; these pack-bridges usually took the form of rough improvised trestle or pile bridges, but in some cases tarpaulins lashed round a wooden framing were used as floating supports in the same fashion as the waterproof sheets above mentioned.

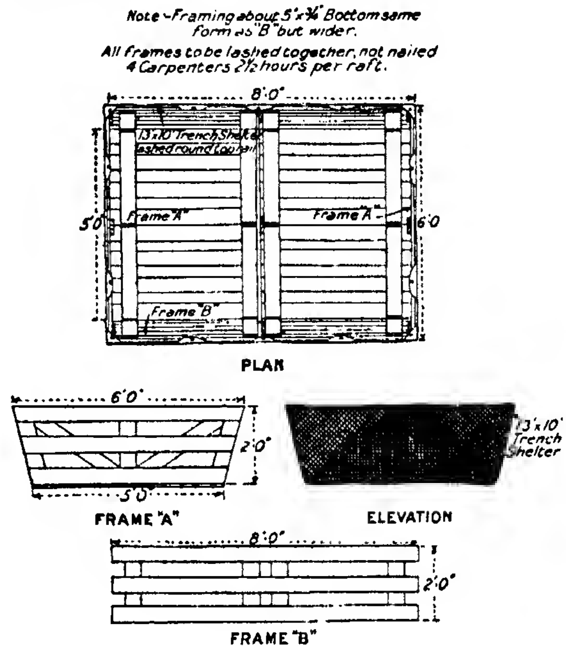

FIG. 14.

For the crossing of minor streams and dykes often met with before or after the main crossing, various devices were used to suit the varying conditions. Plank or light footbridges of the pattern shown in fig. 13 were often sufficient to carry the infantry, but where the span exceeded 10 ft. light trussed bridges of timber, strutted and tied with hoop iron or stout wire, were made up to about 15 ft. in span. Above this limit some form of intermediate support in the form of a float or trestle became necessary. For marshland, muddy ravines, or shell-pitted ground, mats of canvas and wire netting stiffened with wood battens and rolled up for convenience of carriage were found very useful to give a foot-hold. For horse traffic, corduroy mats of timber bound together with wire and picketed down in place were used, as also were the artillery "trench bridges," 12 ft. in span with timber bearers and 1½ in. flooring, made up in sections 3 ft. 6 in. wide to be laid side by side. These were a little heavy for hand carriage; but in most cases they were issued to the artillery before the advance and carried by them in their limbers to be laid down where required.

Next, it becomes necessary to bring forward the field artillery into position on the far bank. For this work the pontoon equipment is invaluable, as it enables a bridge for horse transport to be made across a river more quickly than it is possible by any other means, and the peace training of the British engineers in pontooning work justified itself in the fine work done, notably in the advance across the Aisne in Sept. 1914. The field companies of the New Army were likewise instructed in and equipped for pontooning work, and the material was used to advantage on nearly every waterway on the entire front in France, on the Piave, on the rivers of Palestine, and in Mesopotamia.

Figure 1 (plate) illustrates the type of bridge built with pontoon equipment across a tidal estuary in which the standard service trestle with adjustable transom is used for the bays nearest the shore; that part of the bridge which will ground on the fall of the tide is carried on barrel-piers strong enough to carry the load when grounded, and the floating portion is composed of pontoons. A "cut" is formed in the bridge by disengaging the central floating portions and allowing it to swing on the tide or stream so that vessels may pass freely along

the channel. The bridge is reformed by pulling up on the anchor cables until the cut portion regains its position in bridge. The pontoon bridge shown is the normal bridge capable of carrying columns of infantry in fours, field guns, horse transport, and light cars up to 2-ton axle loads. Where a pontoon bridge has to be built to carry heavy mechanical transport, siege artillery tractors and other heavy loads it is necessary to use more pontoons and group them in the form of rafts as shown in fig. 12, the medium bridge being designed to carry 8-ton axle loads and the heavy bridge 16-ton. The roadway from saddle to saddle of the rafts is carried by heavy steel joists on which two or three layers of chesses are laid.

As the pontoon equipment is always required to move on with the army other types of bridge are substituted for the pontoon bridges as soon as practicable, and these in the late war usually took the form of timber trestle bridges of tree trunks or any other timber found available in the locality. For heavy loads these bridges were constructed of stout squared timber as in fig. 4 (plate), and with a roadway carried on heavy steel joists were capable of carrying all traffic. Where the bottom was soft piles were used in place of trestle piers to support the spans, as a trestle is very liable to sink or tip in soft mud or on an irregular bottom and so throw the roadway out of level. Pile-driving is, however, a slow operation, and plant for this purpose had to be improvised in the field, as no satisfactory portable apparatus has yet been standardized for army purposes.

These heavy timber bridges necessarily take some time to prepare and erect and are not very suitable for extreme loads, and after some war experience it became evident that for a general advance on a large scale the army must be equipped with steel girder bridges to carry the heaviest loads, and capable of transportation in small portable sections and speedy erection on the site. Many types of these bridges were designed to suit the various spans likely to be required, and held in reserve ready for dispatch to the most convenient railhead. Bridging schools were formed to train officers and men in the use of this heavy bridging material, and, when the advance came to be carried out, the corps and army engineers were able to replace the light bridges made by the divisional field companies so rapidly that, almost as fast as the fighting troops could gain ground, the heavy artillery, mechanical transport, and all the other heavy traffic were able to follow up.

Where intermediate support could be obtained on firm ground, piers were often built up of skeleton steel cubes 3 in. by 3 in. by 3 in., each capable of supporting a weight of 40 tons and built up with timber crib work to form single, double or treble cube piers as required. A bridge consisting of a series of comparatively short steel spans could then be built on these piers. The bridge of this type illustrated in fig. 2 (plate) has two spans of 30 ft. and one of 18 ft. on piers about 15 ft. in height.

For larger spans a very useful bridge was the 60-ft. span Warren girder of which an example is shown in fig. 5 (plate). The inadequate support given by the abutments of the broken bridge is here reinforced by the use of a heavy timber trestle pier on the towpath.

For larger semi-permanent bridges on the main routes great use was made of the "Hopkins" bridge, which was a girder bridge made in two sizes capable of erection in spans to any multiple of 15 feet. The lighter type was suited to spans of 60 to 90 ft., and the heaviest design for spans over 100 feet. This was normally used for spans of about 120 ft., but in fig. 6 (plate), representing a bridge over the dry Canal du Nord, the span is 180 feet. The loading must of course be calculated according to the span adopted, 150 ft. being the limiting span at which this type will carry 35-ton tanks singly.

The special feature of the design of this bridge is that of great portability, the heaviest piece weighing only 10½ cwt., so that the whole bridge may be carried in G.S. wagons if required. Usually, however, the bridge was delivered on site by lorries, the 120-ft. span being carried in 35 lorry loads. The bridge is built up upon the near bank in extension of the centre line of site and all the parts bolted together to complete the two main girders with cross bracing. The construction of the abutments usually proceeds simultaneously with the erection of the girders.

The method of launching this bridge is shown by fig. 7 (plate), which shows a 150-ft. span being got into position at Pont de Nieppe, near Armentières. The flooring, consisting of rolled steel joists as cross girders and longitudinals, with timber decking laid crossways, is added when the bridge is in position.

Another very clever design of bridge specially adapted for the military requirement of speed in erection is the "Inglis" bridge. This bridge in its pyramid form is illustrated in fig. 8 (plate), but the rectangular form afterwards designed is better suited for mechanical transport.

The particular feature of this bridge is the absence of any bolting or riveting of joints. The steel tubes of which the girder is composed have merely to be fitted into the special junction boxes carried on the ends of the transoms and stiffeners, and are held in place by pins secured by split pins. The launching of the bridge is most quickly done by constructing the bridge in skeleton parallel to the river with enough counter-weight on the tail to enable it to be swung on a special trolley or carriage as shown in fig. 9 (plate).

The bridge, when in place, is then lowered from its carriage and decked over, and lastly the tail is dropped to form an approach as in fig. 10 (plate) in which a tank is shown crossing the bridge. This bridge can carry a tank over a gap of 105 feet. Where a wider river than this has to be dealt with the bridge is carried on special heavy pontoons (fig. 15), or four bays of the bridge may be used on three of these pontoons as a raft, which is then warped across the river. The projecting bay forms the landing stage for the tank (fig. 16).

FIG. 15.—Inglis Rectangular Tubular Bridge Mk II. combined with the heavy pontoon.

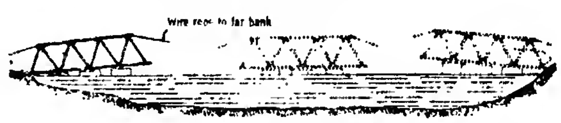

FIG. 16.—A 35-ton Tank being ferried across a river on a raft.

The construction of bridges to carry mechanical transport always involves work on approaches, sometimes of considerable length, to carry this traffic on and off the bridge to the main road, and the officer selecting the site has to take carefully into account the time which will be entailed in this construction, as well as the best span or combination of spans to use for the bridge itself. For instance, on a high level site it may sometimes be advantageous to build several smaller spans supported on timber trestles or steel-cube piers to reach the main span so as to save the delay of filling a high embankment approach. Usually the time for constructing a permanent macadam approach road to the bridge would be too great, and the common form of approach to a bridge for heavy traffic was a road of beech slabbing cut in the forests to a thickness of 2 in., about 1 ft. in width and 10 ft. in length. These slabs were best laid for a single roadway in herring-bone fashion, so as to make a road of about 15 ft. in width, the slabs being spiked to longitudinal sleepers and secured by a heavy timber curb along both sides of the road. It is important that the immediate approach to the bridge should be laid out in true alignment and level with the bridge decking, which also should be as even as possible, so that stresses due to impact are reduced to a minimum, and traffic is able to reach the bridge, and move clear of it without special effort.

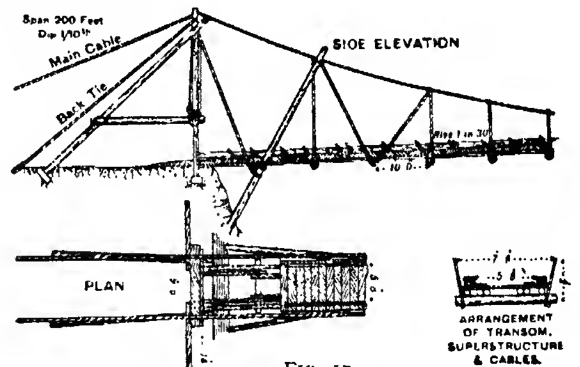

FIG. 17.

In mountainous country where pack transport has to be chiefly used, and in theatres of war where still more primitive conditions of transport exist, the field suspension bridge (fig. 17) is the most common form of bridge for any considerable span. Suspension bridges have been built in the field to carry lorries, but usually they are only required for pack or even foot traffic. The best materials to use for the cables are chain or steel wire ropes; but telegraph wires are frequently used, and hemp ropes, thongs of hide, or ropes of creeper or grass, have been employed.

Aerial ropeways, too, have been of great value in mountainous countries for the supply of ammunition, stores and water, to save transport up a long steep incline, or as a temporary means of com-

munication across a deep gorge or wide river. Many forms of floating bridges have also been constructed from local boats or barges where the pontoon equipment has not been available.

In uncivilized countries the chief problems for the bridge-builder are to devise the best use to which to put the scanty supply of materials available, and to adapt the local resources of the country to advantage, knowing that the transport difficulties render it impossible to obtain all he would desire. But, great as is the task of bridge-building for an army in undeveloped countries, greater still is the work of reconstruction during an advance in a highly developed theatre of war such as France. There the accumulation of means of attack and defence on a grand scale is made possible by the fulness of the communications, yet at the same time each of these many lines of communication is sensitive at every river-crossing. Almost without exception these bridges are destroyed by the enemy on his retirement, and an army cannot safely push on its advance without its full equipment of battle means and without clear routes for its supply transport. Hence it is no exaggeration to say that in the final campaign of 1918 in France the power of the British army to advance depended on the speed with which the Royal Engineers could construct bridge-crossings and roads.

During the period Aug.–Nov. 1918 no less than 539 heavy bridges were erected on this front alone, of which 326 were standard steel bridges and 213 of heavy timber or salved material, not taking into account the innumerable light improvised crossings and footbridges by which the leading infantry were enabled to attack, and the pontoon and light trestle bridges for field artillery and horse transport.

For such a task executive energy, organization and technical skill are equally, and each in the highest degree, necessary. And to these qualities of the military bridge-builder must be added, for the work in the forward zone, that of personal devotion under fire. It is significant that of the Victoria Crosses awarded to officers and men of the Royal Engineers in the World War more than half were won by acts of conspicuous gallantry in the construction and demolition of bridges. (E. N. S.)

BRIEUX, EUGÈNE (1858–), French dramatist (*see* 4.563*), published four plays after 1910: *La Foi* (1912); *La Femme Seule* (1913); *Le Bourgeois aux champs* (1914) and *Les Américains chez nous* (1920). He also wrote some accounts of travel, *Voyages aux Indes et à Indo-Chine* (1910) and *Au Japon par Java, la Chine, la Corée* (1914), as well as a couple of pamphlets addressed to soldiers, one before and one during the World War, during which he devoted himself with particular ardour and activity to the care of those blinded by wounds.

BRIGGS, CHARLES AUGUSTUS (1841–1913), American theologian (*see* 4.566), died in New York June 8 1913. His last published works were *Church Unity* (1909); *The Fundamental Faith* (1913) and, posthumously, *Theological Symbolics* (1914).

BRIGHT, JAMES FRANCK (1832–1920), English historian, was born in London May 29 1832. He was the son of Richard Bright, the physician who first diagnosed "Bright's disease" in 1827, and his mother was Eliza Follett, sister of Sir William Follett, who was solicitor-general and attorney-general in Peel's administration (1834–44). He was educated at Rugby under Dr. Arnold and at University College, Oxford, where he graduated with first-class honours in 1854. In 1856 he was ordained deacon and joined the staff of Marlborough College, and was the first public schoolmaster to organize a modern side. For this purpose he wrote the necessary school-books himself, including his well-known *History of England*. After his wife's death in 1871 he left Marlborough and went to Oxford as a modern history tutor and lecturer at University, Balliol and New Colleges and in 1874 was elected to a fellowship at University and in 1878 to an honorary fellowship at Balliol. In 1881 he became master of University College, and threw himself with vigour into university and City life, becoming treasurer of the Radcliffe infirmary, and founder of the first technical school in Oxford, for which he presented a site. His latter years were spent at Ditchingham, Norfolk, where he died Oct. 23 1920. He also published *Lives of Maria Theresa and Joseph II.* (1897).

BRINKLEY, FRANK (1841–1912), British author, was born in 1841. Having entered the British army, he went to Japan in 1867 in command of a battery of artillery. In 1871 he became principal instructor at the Marine College, Tokyo, under the Japanese Government, and henceforth devoted himself to things Japanese. He left the army, married a Japanese lady, and in 1881 founded the *Japan Mail*, of which he was proprietor and editor till his death. He was also correspondent for the London *Times* in Japan. He published *Japan* (1901); *Japan and China* (1903), as well as a Japanese-English dictionary, and was the author of the article JAPAN in the earlier volumes of this encyclopaedia. He held a unique position among foreign residents in Japan, alike as a profound student of its history and art, and as a powerful factor in international politics. He died at Tokyo October 28 1912.

BRISSON, EUGÈNE HENRI (1835–1912), French statesman (*see* 4.574), was again elected president of the Chamber in 1912, and died at his official residence April 14 1912.

BRITISH COLUMBIA (*see* 4.598).—This Canadian province is traversed from S. to N. by four principal ranges of mountains—the Rocky and Selkirk ranges on the east, and the Coast and Island ranges on the west. The Rocky Mountain range preserves its continuity, but the Selkirks are broken up into the Purcell, the Selkirk, the Gold and the Cariboo mountains. Between these ranges and the Rockies lies a valley of remarkable length and regularity, extending from the international boundary line along the western base of the Rockies northwards for 700 miles. West of these ranges extend the remains of a vast plateau or tableland with an average elevation of 3,000 ft. above sea-level, which has been so worn away and eroded by watercourses that in many parts it presents the appearance of a succession of mountains. In others it spreads out into wide plains and rolling ground dotted with low hills, which constitute fine areas of farming and pasture lands. This interior plateau is bounded on the W. by the Coast Range and on the N. by a cross-range which gradually merges into the Arctic slope.

The area of British Columbia according to the census report of 1911 was 353,416 sq. m. of land, 2,439 sq. m. of water, a total of 355,855 sq. m., and in 1919 was estimated at 395,610 sq. m.

Population.—The pop. of British Columbia increased from 36 247 (less than 10,000 of whom were whites) in 1871 to 392,480 in 1911. The estimated pop. in 1920 was about 650,000. The Chinese pop. was 19,568 in 1911. Japanese immigration took place chiefly after the restriction of Chinese immigration in 1906: in the census of 1911 Japanese numbered 8,587. It is, however, limited by agreement between the Governments of Canada and Japan to 400 per year. After 1906 Hindus, mainly Sikhs, attracted by the high wages paid to other Orientals, came in large numbers and objection to their immigration was quite as strong as that to Chinese and Japanese. The situation was a delicate one from the fact that these people were British subjects and many of them had served in the British army as soldiers. Their further influx was prevented by diplomatic arrangement. The number of Hindus in the census of 1911 was recorded as 2,292. The Indian pop. was returned as 24,744. Of these all but 1,334 were professing Christians. Although about 750,000 ac. have been set apart and occupied as Indian reservations, not more than 2% of the land has been cultivated. The only Indians of British Columbia who devote themselves to agriculture to any extent are several tribes in Yale and Okanagan districts. The Indians are entirely self-supporting: those of the northern interior sell furs to the various trading companies; those on the coast and southern interior are employed in fishing, in the salmon canneries, and in hop-picking. To some extent they are employed in the lumber woods and in various other capacities. Their education is almost exclusively in the hands of several religious denominations, Methodist, Presbyterian, Anglican and Roman Catholic, whose respective spheres of influence are recognized by the Department of Indian Affairs. The Indians of British Columbia have always been peaceably disposed, largely in consequence of the satisfactory manner in which the Hudson's Bay Co. dealt with them for many years. Several of the tribes on Vancouver I. and mainland coasts and one or two in the interior were at one time regarded as a dangerous element, but they are now quiet and peaceable. The Indians are divided into many tribes under local names, but fall naturally on linguistic grounds into a few large groups. They are made up of the following stocks: Haidan, Tsimshian, Wakashan, Dêne (or Athapaskan), Kootenaian and Salishan. More than 2,000 belong to nomadic tribes whose affiliations are probably Athapaskan. There was for some years a considerable decrease of Indian population on account of the ravages of disease, but it would

** These figures indicate the volume and page number of the previous article.*

appear that it is again on the increase. By origins, the chief elements of the pop. of British Columbia in 1911 were: English 133,186; Scotch 74,493; Irish 40,642; Welsh, etc., 4,362; German 11,880; Chinese 19,568; Indian 24,744; Japanese 8,587; Hindu 2,292; Scandinavian 15,968.

Vancouver, by far the largest city in the province, had in 1919 a pop. of 115,000. Victoria, 84 m. from Vancouver, is the capital of British Columbia, and rests on the most southerly point of the peninsula into which Vancouver I. tapers to the Straits of Juan de Fuca. While it possesses some important industries and is the headquarters of others, it is essentially a residential and social centre, to which the fact that it is the capital city adds much. The Legislative buildings, which form the most striking feature of the city upon entering the harbour, contain fine collections of natural history, mineral, agricultural and horticultural specimens. The pop. in 1919 was 39,500. Three m. from Victoria is the fine harbour of Esquimalt, with a naval dockyard. On Saanich mountain, near the city, is the Dominion Observatory. New Westminster, known also as the "Royal City," 12 m. from Vancouver and connected with it by an electric railway, had in 1919 a pop. of 19,000. It is the centre of the rich farming section of the Westminster district, and from its situation on the Fraser river is naturally associated with the salmon-canning industry. It is also largely interested in the lumber business. Nanaimo, popularly known as "The Black Diamond City," is the headquarters of the oldest colliery in the province. In the neighbouring country fruit-growing is carried on extensively, and diversified farming is increasing at a rapid rate. It has a fine harbour and very picturesque surroundings, and is the centre of the herring industry. The pop. in 1919 was 7,800. Prince Rupert is a western terminus of the Canadian National railways. Other towns are Ladysmith, Vernon, Nelson, Armstrong, Kelowna, Enderby, Kamloops, Fernie, Rossland, Revelstoke, Trail, Cranbrook, Kaslo, Salmon Arm, and the two Albernis.

Government.—The Government of British Columbia consists of a lieutenant-governor appointed by the governor-general in Council, an Executive Council of 11 members chosen from the Legislative Assembly, and a Legislative Assembly of 47 members, elected every four years. Every adult British subject who has resided six months in the province is entitled to vote. The province is represented in the Dominion Parliament by 13 members of the House of Commons and 6 senators. Municipal government has been introduced, though a large area is still unorganized.

Education.—The school system of British Columbia is free and non-sectarian. In each district where 20 children between the ages of 6 and 16 can be brought together the Government builds a schoolhouse, makes a grant for incidental expenses, and pays a teacher. In cities having charge of their own schools liberal grants are made by the Government. Attendance at school is compulsory from 7 to 14 years of age. In 1919 933 schools were attended by 72,006 pupils. There were 45 high-schools in 1919 with 5,806 pupils, and the Government maintains two normal schools, one at Victoria and one at Vancouver, for the training of teachers. The university of British Columbia, founded in 1908, is supported by the province, and has magnificent grounds at Point Grey, near Vancouver. It had about 900 students in the session 1918–9.

Finance.—The revenue and expenditure of the province were respectively $10,479,259 and $15,970,877 in 1913–4; $6,291,693 and $10,422,206 in 1915–6; (estimated) $9,868,325 and $10,800,805 in 1917–8; and $12,609,960 and $13,313,303 in 1919–20. The liabilities of the province were $52,288,067 and assets $59,642,124 in 1919.

Agriculture.—The area of farming land in British Columbia probably does not exceed 10,000,000 ac. and it is distributed in widely separated valleys. Hence agriculture cannot be regarded as a basic industry of the province, although it has made wonderful progress. Owing to the natural conditions small mixed farming is predominant, including fruit-growing, grain-growing, stock-raising, poultry-raising and the growing of roots and vegetables, to which may be added the raising of sugar beets, tobacco and hops. Many tracts rendered fertile by irrigation have been shown to be unusually well adapted to the cultivation of both fruits and cereals, though a large acreage is suitable merely for grazing.

Fruit-growing in the interior is largely restricted to apples which find an extensive market in the Middle West, eastern Canada, and Great Britain. Apples, grapes, apricots, peaches, tomatoes and melons grow to perfection in the southern interior of the province. Small fruits such as strawberries, raspberries, cherries, loganberries, prunes, etc., produce excellently in all parts of the province, but the cultivation of these is largely confined to Vancouver I. and the N. side of the Fraser river on the lower mainland. The principal fruit-growing districts are Vancouver I., portions of Westminster district, Okanagan valleys, and land along the Arrow and Kootenay lakes. Tobacco is grown successfully in the Kelowna district and in Okanagan, which also produces onions. Hops are grown in the lower Fraser valley. Wheat was formerly grown somewhat extensively in parts of the interior but most wheat lands have given place to fruit-growing and mixed farming, and wheat is now grown for poultry food. Oats is the staple grain crop although barley and other grains are also grown. The rich pastures, the prolific forage crops and pure water are natural conditions which have brought both dairying and live stock into prominence. The raising of hogs is profitable in certain parts and there is a large demand for all pork products. Draft horses are bred extensively and there are many herds of choice cattle especially in the lower mainland and on Vancouver Island. Poultry-raising has attained large proportions, the demand for all kinds of poultry being far in excess of the supply. The yields of the principal field crops in 1920 were: wheat 874,300 bus.; oats 1,663,000 bus.; barley 364,100 bus.; potatoes 2,933,700 bus.; roots 3,220,000 bus.; hay 254,000 tons.

Lumbering.—The stand of timber in British Columbia is estimated to be 400,000,000,000 feet. The value of the manufactured timber is about $30,000,000 annually and it is estimated that the forests are growing faster than they are being cut, so that if properly conserved and developed the timber supply of British Columbia should be inexhaustible. Throughout the coast region, and to a lesser degree in the wet belt of the interior, there are great stands of Douglas fir, hemlock, red and yellow cedar, spruce, large and commercial pines. The Douglas fir, however, is not found farther N. than the northern end of Vancouver Island. The amount of hard woods such as oak, maple and alder is inconsiderable and commercially negligible. Douglas firs, cedars and spruce 8 to 10 ft. in diameter are not unusual in the coast region, while there are individual specimens of Douglas fir 300 ft. high with a girth of 50 to 55 ft. A stand as high as 300,000 ft. to the acre exists in places on Vancouver I. and the coast. Douglas fir, also commercially known as "Oregon pine," is the largest commercial factor. The red or giant cedar is probably the most useful of the trees, nearly every portion of the tree being available for some use, principally shingles, fence posts, telegraph poles and interior finishing. The western white spruce is also very valuable and is employed for various purposes such as box-making, furniture and pulp wood. Saw-mills are located at all the important points of the settled province. There is a constant demand for British Columbia timber in the prairie provinces and quantities are exported abroad. The number of lumber firms reporting to the Dominion Bureau of Industries in 1918 was 201. The quantity of lumber cut was 1,157,636,000 ft. at a market value of $28,351,207; of this 714,018,000 ft. was of Douglas fir. The total capital invested in the industry was stated as $42,408,448 and the average number of employees 13,268 to whom $31,621,118 was paid in wages.

The manufacture of pulp and paper has developed on the coast of British Columbia and is one of the largest and most profitable industries. Pulp is largely produced from white spruce, although hemlock, Douglas fir and other coniferous trees can be used with success. The total production of pulp in 1918 was 173,161 tons valued at $4,062,724. The principal production was newsprint and wrapping papers. The value of the newsprint was over $7,500,000 and of the total production $9,264,705.

Sport.—British Columbia is rich in big game, fur-bearing animals and game birds. The principal districts which are resorted to by sportsmen are Cassiar, where moose, caribou and mountain sheep are plentiful; the interior of Vancouver I. is famed for its wapiti, bear and cougar; the Bridge river and Chilcotin districts where the bighorn, mountain goat, grizzly and black bear, mule-deer and, in parts, caribou, are plentiful; the Similkameen district near the International Boundary; E. Kootenay, where E. of the Columbia river there are moose, wapiti, bighorn sheep, mountain goat, several varieties of deer and black and grizzly bears; and the Nelson district. Between Fort George and the Little Smoky river is a magnificent moose country.

The game birds are ducks and geese, both abundant, and grouse, pheasants, quail, pigeons, plover and snipe. The game fish, as distinguished from commercial varieties, are principally trout, spring salmon and steelhead, and are everywhere abundant in their respective habitat.

Fisheries.—The chief fisheries are salmon, halibut, cod, oolachan, sturgeon, herring, smelts, sardines. The varieties of salmon are Quinnat, Chinook or Tyee salmon, silver salmon or cohoe, sockeyes or blue-black salmon, dog salmon, humpback. Next in importance, at least to the angler, are the cut-throat trout, steelhead and Dolly Varden trout (Malina); all of these are exceedingly abundant. The spring salmon is the first to appear and varies from 10 to 75 lb. in weight. It is largely shipped fresh to the markets. The sockeye and cohoe are almost exclusively used for canning, and the dog salmon and humpback, which run in immense numbers, are among the most important sources of supplies for the canneries. Next to the salmon the halibut is the most important commercial fish. It is found all along the coast from Bering Strait to San Francisco, but the chief source of supply in Canadian waters is in Hecate Strait and N. of it. It finds an extensive market in the United States and eastern Canada. Herring run in enormous numbers at certain periods; the headquarters of the herring fisheries are at Nanaimo. The cod, the Cultus cod, the Alaska black cod or "skil," the red rock cod and other varieties of fish which pass under the name of cod abound all along the coast, and enter largely into the fishing industry. The oolachan, smelts, anchovy, and sardines run in enormous numbers and are caught principally for the local market.

Sturgeon, rock fish and shad are other varieties of food fish. The mackerel is unknown on the Pacific coast. A native oyster, locally known as the "Olympian," is found in considerable quantities at many places along the coast of British Columbia and the state of Washington and is edible. The eastern oyster has not been propagated, but young oysters are imported from eastern Canada and successfully cultivated. So far it has not been found practicable to propagate lobsters. The rivers are abundantly stocked with fish, principally salmon or trout, and there are also whitefish and graylings in the northern waters. The whaling industry was established about 1906 by the Pacific Whaling Co. with headquarters near Nootka and has been most successful. The once important sealing industry is now extinct. Only native Indians are permitted to take seals in Pacific waters and as the seals are again increasing in numbers the catch is correspondingly great. Dog-fish are very numerous at various points along the coast and are rich in oil.

The salmon-canning industry is still considerable, but the Fraser river has been much depleted and steps were being taken in 1920 towards conservation. The fishing industry was greatly stimulated during the war and increased in respect of many of the smaller fishes by 100 per cent. Great Britain is the largest market for British Columbia salmon. The values of the varieties caught in 1919 were: salmon, $17,537,164; halibut, $4,617,484; herring, $1,109,870; pilchards, $371,871; cod, $368,838; flounders, etc., $130,940; black cod, $116,580; soles, $90,848. British Columbia contributed $25,301,607 in 1919, almost half of the entire fisheries production of Canada. There were then 74 salmon canneries and one other cannery in operation. There were 9 whale and fish oil factories and 20 fish-curing establishments, representing a capital in all fisheries of $16,358,505. The principal canning operations are carried on in the Fraser river, Skeena river, Rivers Inlet, Naas river, on the coast of Vancouver I. and in a few outlying districts.

Mining.—Mining in British Columbia originated with the placer deposits of the Fraser river and its far-off tributaries in the Cariboo district, from which it is estimated that some $55,000,000 or $60,000,000 of gold has been extracted. The undeveloped coal-fields of British Columbia have been estimated to cover 1,351 sq. m., of which 834 are in Vancouver and Graham I. (Queen Charlotte Is.), and 517 on the mainland. Their resources are stated at 3,110 million tons on the islands and 37,115 million tons on the mainland, of which 61 million tons are anthracite, 39,674 million tons bituminous coal and 490 million tons lignite. There are large deposits, as yet undeveloped, of magnetite and haematite iron. New interest attaches to the Queen Charlotte Is. on account of the extensive deposits of oil shale extending along the W. coast of Graham Island.

The mineral production in 1919 amounted to $33,296,313, made up of gold, $3,437,145; silver, $3,592,673; lead, $1,526,855; copper, $7,939,896; zinc, $3,540,429; coal, $11,337,705; coke, $637,966; miscellaneous products, $1,283,644.

Manufactures.—Lumber in all its forms is manufactured for home consumption and export in over 200 saw-mills. The Canadian Pacific railway owns and controls large smelting works at Anvox and at Trail. The coking of coal, manufacture of pulp and paper, salmon canning, sugar refining, and the manufacture of cement are other industries. There were in 1918 1,786 factories with $244,697,000 capital, giving employment to 48,779 persons who received $51,051,000 in wages and salaries. The value of materials used was $103,936,000 and of goods produced $207,678,000.

Shipbuilding was greatly stimulated by the World War. Owing to the shortage of shipping after its outbreak, a programme of building wooden ships was undertaken under the auspices of the Provincial Government. The Foundation Co. constructed a number of vessels for the French Government, and steel vessels for the Dominion Government were constructed at Victoria and Vancouver.

Transport.—The main line of the Canadian Pacific railway enters British Columbia through the Kicking Horse pass on its way to Vancouver. Another line of the same railway, entering the province by means of the Crow's Nest pass, serves the Kootenay country and joins the main line, by several water connexions, at Revelstoke. The Canadian National traverses the Yellowhead pass and proceeds through the northern part of the province to Prince Rupert, near the Alaskan boundary. The Canadian National railways also run through the Yellowhead pass, turning S. to Kamloops, parallel to the Canadian Pacific, on the opposite side of the Fraser river, to Vancouver. From Victoria, the Esquimalt and Nanaimo railways run as far N. as Comox, and there is also a Canadian National line on the island. The Pacific Great Eastern from N. Vancouver to Fort George, owned and to be operated by the Provincial Government, was under construction in 1921. Many portions of the province are tapped from the United States by branches of the Great Northern railway. The total mileage of railways in 1917 was 3,885.

The British Columbia Electric railway has radial lines extending from Vancouver to points in the Westminster district, and a suburban line from Victoria running through the Saanich district.

The Canadian Pacific railway operates a fleet of steamships which reach coastwise all points northward from Victoria and Vancouver to Prince Rupert and several ports in Alaska (including also ports on the coasts of Vancouver I. and the Queen Charlotte Is.) and S. to Seattle. There is also direct steamship connexion with San Francisco. The Canadian National, with a terminus at Prince Rupert, makes regular connexions by fine twin-screw steamers with Vancouver and Victoria. The coastwise trade, especially in the summer, is enormous. The Canadian Pacific has also a splendid fleet of steamships plying to and from Japan and China, on the outward trip touching at the Philippine Is., and traffic arrangements with lines of steamers to and from Australia and New Zealand. There are numerous lines of steamships on the Pacific which make Victoria and Vancouver ports of call. The opening of the Panama Canal has proved of great advantage to the province. Steamers also ply on the navigable rivers and lakes in the interior of the country.

(W. L. G.*)

BRITISH EAST AFRICA.—The East Africa Protectorate, or "British East Africa," was in July 1920 annexed to the British Crown and renamed Kenya Colony (*see* KENYA).

BRITISH EMPIRE (*see* 4.606*).—The white population of the British Empire in 1921 was (approximately) 60,693,000 (of whom about three-fourths lived in Great Britain and Ireland). Its brown or black population was (approximately) 360,670,000 (of whom British India, the Protected Indian States, Ceylon and the other Eastern colonies and dependencies contributed approximately 323,375,000, West Africa 20,151,000, East Africa 6,315,000, South Africa 5,801,000, British Central Africa 2,600,700, and the West Indies 1,490,000). The population of Tanganyika Territory (German East Africa) is estimated, in the British sphere of influence, at 3,500,000. The native population of German South-West Africa is small, owing mainly to the system of repression in force under German rule; the white inhabitants are between six and seven thousand. Forty-two per cent of the population of the German colonies in Africa were assigned under the Peace of Versailles to Great Britain, against 33% assigned to France and 25% assigned to Belgium. The total area of what was German New Guinea, along with the Bismarck Archipelago and the other islands attached to it, is about 90,000 sq. miles.

A remarkable development took place between 1910 and 1921, both in theory and in practice, in matters relating to the constitutional framework of the British Empire. It is true that at the Imperial Conference of 1911 a proposal, not thoroughly thought out, to set on foot an Imperial Council, of a somewhat nebulous character, received little support; and that, as long as Sir Wilfrid Laurier held the helm in Canada, closer coöperation among the members of the British Commonwealth of Nations was practically out of the question. But this same Conference witnessed a new departure which proved of singular good fortune for British interests. At a secret meeting of the Imperial Defence Committee Sir Edward Grey explained to the dominion prime ministers the hidden mysteries of European and world politics. Mr. Fisher was at the time the Labour Prime Minister of the Commonwealth of Australia, and the feelings of confidence and goodwill aroused by this spontaneous act on the part of the British Government bore abundant fruit when, after a brief interval, he returned to power in the autumn of 1914.

In other ways the proceedings of the 1911 Conference were of importance. Although the proposal of a permanent council or committee, to give continuity to the work of the Imperial Conferences, had come to nothing, mainly owing to the objections raised by Canada, still the establishment of a separate "Dominions Department" of the Colonial Office in London and the issue by it of annual reports were distinct steps in this direction. In any case, in going through the proceedings of the 1911 Conference, one notes a closer grip of existing facts than had been shown at previous conferences. Thus a satisfactory solution was arrived at of the problem of naturalization within the Empire, a solution which was afterwards embodied in imperial legislation. Each dominion must continue to retain the power of regulating its own system of naturalization; but five years' residence in any portion of the Empire qualifies an applicant for the grant of imperial nationality, the decision of the question resting with that portion of the self-governing Empire in which such applicant has resided during the twelve months immediately preceding his application. A discussion of the subject of emigration brought out the great increase which had taken place in the most recent years in the number of British emigrants to the dominions, compared with the number of such emigrants to the United States.

***These figures indicate the volume and page number of the previous article.**

The Conference, further, revealed the weakness of the existing system of political intercommunication. It was shown that the Declaration of London, which involved important questions of maritime law of vital interest to communities separated by thousands of miles of sea from Great Britain, had been approved without any consultation with or even notice given to the dominions. The excuse was that the dominions had not been parties to the Hague Conference; and that the Declaration of London had been the outcome of the proceedings of that body; but the British Government adopted a very apologetic tone and readily endorsed a resolution that, in future, the dominions should be given the opportunity of considering the matter before the signing of any convention which might affect their interests by the British delegates at the Hague Conference; and this same general rule should, as far as possible, hold good in the negotiation of other international agreements.

The anomalous character of the British Empire was well illustrated by the adoption of a resolution which was, indeed, the logical sequel of the action of Lord Salisbury in 1897 in connexion with the grant of a fiscal preference by Canada to British goods; but was none the less of a centrifugal character. It was agreed that in cases in which a British commercial treaty with a foreign Power bound the dominions, negotiations should be opened with the object of securing liberty to any of them to withdraw from the operation of such treaty, without impairing its validity with regard to the rest of the Empire. In some cases foreign Powers were unwilling to agree to such a proceeding; so that the only alternative was the denunciation by Great Britain of a treaty which otherwise it might be in her interest to retain.

Apart, however, from details, the Imperial Conference of 1911 did important work in cementing the intangible links connecting the different parts of the British Commonwealth. In the words of General Botha, it called into life "that friendship which must lead to coöperation, and better coöperation than we have had in the past."

Towards the end of 1911 Sir Wilfrid Laurier's long period of rule in Canada came to a close, the Liberal leader suffering defeat at the general election which took place over the question of trade reciprocity with the United States. In Ontario, whatever may have been the case elsewhere, the contest was fought as one connected with the maintenance of the British connexion; and the triumph of the Conservatives was hailed as a manifestation of imperial loyalty. The new Prime Minister, Sir Robert Borden, had for some years consistently maintained the view that, whilst a more generous contribution by Canada to the needs of the imperial navy was necessary, such contribution must involve a real partnership in the decision of those questions of foreign policy on which might depend the issues of peace or war. For the time being he was satisfied with the undertaking of the British Government that a Canadian representative would always be welcome at meetings of the Imperial Defence Committee, but it was obvious that this could not be the final solution of the problem. Sir Robert's attempt to give substantial help to the British navy by the gift of three battleships failed, it is true, through the action of the Canadian Senate in rejecting the measure; but the political claims which went along with the proposed gift were soon to find a partial fulfilment, the tremendous efforts put forth by the dominions in the World War forbidding, in any case, a simple return to the practice of the past.

On the purely naval and military side of the question, indeed, the results of the war might seem to vindicate the past policy. Dominion statesmen pointed with pride to the action of the little Australian navy, which, at the outbreak of war, promptly gave its services to the capture of the German colonies in the Pacific, whilst it was forthwith placed under the British Admiralty. The question of separate navies was for a long time a bone of contention between British naval experts and dominion public men, but it seems now impossible to contest the principle, though as late as 1918 the British Admiralty continued to advocate a single navy, under a single naval authority. In military matters the development of an imperial general staff and improvement in military education had gone on, under the scheme initiated by Lord Haldane in 1909. Congenial ground was afforded for military reforms by the system of compulsory military training prevailing in Australia and New Zealand, a system which in the former country had been introduced by the Labour party. One may admit that the successes of the dominion troops in the war were mainly due to the individual initiative and valour of the rank-and-file and yet recognize the merits of the machinery through which these worked.

The independent character of the various portions of the Empire was well illustrated by the different attitudes they took up towards conscription, the Parliaments of New Zealand and of Canada, in spite of the hostility of the province of Quebec, having adopted it, whilst the people of Australia at two referenda refused its endorsement.

From the political standpoint, however, the situation was less satisfactory. The British Empire had gone to war in 1914 without the dominions having any voice in the decision. The circumstances, indeed, with regard to the violation of Belgian neutrality were so manifest as, in this particular case, to prevent the possibility of discussion; but, in the event of trouble in the future, the *casus belli* for the whole Empire may not always be so clear. It was obvious, then, that there was a real weakness in the system, requiring a practical remedy.

No Imperial Conference was held in 1915, owing to the exigencies of the war; and when it met in 1917, and again in 1918, it was accompanied by a new organ of government, of extreme significance. The Imperial War Cabinet was not, indeed, a Cabinet in the strict use of the word; because it had no direct executive authority, and because a majority at its sittings could not bind a dissentient minority; but, for practical purposes, it fulfilled the functions of a Cabinet, in concentrating upon a single objective the whole moral and material strength of the scattered Empire. It was hoped that an instrument which had proved so useful for the purposes of war might give the solution to the problem of the Empire in times of peace; such being the expectation of Mr. Lloyd George and of Sir Robert Borden. But a Cabinet of this kind requires a sacrifice of separate interests to the collective good such as is not often found except in times of emergency. Accordingly the meeting of Prime Ministers held in 1921, whatever may have been Lord Milner's intention when summoning it, bore at least in its initial stages little resemblance in its proceedings to a constitutional Cabinet, though in its final report it gave expression to the unanimous views of the Governments of the Empire.

At the opening meeting Mr. Lloyd George declared that, while in the past Downing Street controlled the Empire, to-day the Empire took charge of Downing Street. The main subject of discussion was the question of the renewal of the Anglo-Japanese Alliance. It was agreed by all parties that the alliance would require changes in its form, because of the changed conditions of the world, and in order that it should comply with the obligations imposed by membership in the League of Nations. But on the general question of the renewal of the treaty there was a difference of opinion. The Canadian Prime Minister, adopting the point of view of American public men and intent upon the promotion of the closest friendly relations between the British Empire and the United States, was opposed to the renewal of the treaty in any form. The Australian and New Zealand representatives, on the other hand, who had much to fear from the presence in the Pacific of an unfriendly or offended Japan, recognized in the renewal of the treaty the surest pledge for future peace. The friendship of Japan during the war had undoubtedly been of the greatest service to the British Empire; and the rôle of a Power, such as Great Britain, with over 300 million Asiatic subjects, might well be to act as a connecting link between the United States and Japan, playing to some extent the part played by France after the Anglo-French agreement of 1904 in establishing more friendly relations between Great Britain and Russia.

It fortunately proved unnecessary that the question should be decided forthwith; and in July the invitation of the United

States to the various Powers to attend a general conference later in the year on the subject of disarmament and the political questions connected therewith gave the opportunity for the whole question to be discussed from every point of view.

With regard to the question of naval defence the Conference resolved "that, while recognizing the necessity of coöperation . . . to provide such naval defence as may prove to be essential for security, and while holding that equality with the naval strength of any other Power is the minimum suggested for that purpose, this Conference is of opinion that the method and extent of such coöperation are matters for the final determination of the several Parliaments concerned, and that any recommendations thereon should be deferred until after the coming conference on disarmament."

It should further be noted that the dominion Prime Ministers attended the Cabinet Council at which the reply to the French note on Upper Silesia was considered. It had been intended to hold a special constitutional conference in 1922, but, having regard to the constitutional developments since 1917, the meeting saw no advantage in holding such a conference. They recognized, however, the necessity of continuous consultation, which could only be secured by an improvement in the communications between the different parts of the Empire.

Whether or not an Imperial Cabinet, on the model of the Imperial War Cabinet, be found to be practicable, it should be noted that a more elaborate method of solving the problem has been put forward. The "Round Table" movement took its rise from a small body of able and hard-working men who, having helped to bring about the union of South Africa, transferred their energies to the solution of the British imperial problem. A patient and detailed investigation of the whole subject was made by groups of inquirers, mainly belonging to the universities, throughout the Empire; and the results were recorded in carefully annotated volumes. The final outcome of the views of the majority—in most groups there was a dissentient minority—was the volume, *The Problem of the Commonwealth*, by Lionel Curtis, published in 1917. Though the book bound no one to the author's individual views, it is not likely ever to be superseded as a solution of the problem, from the point of view of an imperial federationist. Whilst the necessity of an Imperial Parliament and Executive was insisted upon, the necessity was also recognized of limiting, as far as was compatible with imperial safety, the functions of such Imperial Parliament and Executive. Dominion nationalism forbade that questions other than the management of foreign affairs, Imperial defence and finance in its relation with defence, along with the control of subject races, should be the province of the central authority. Thus the subject of the tariff was held to be outside its province.

Whatever its logical merits, the proposal failed to secure the support of public men and of the electors in the dominions; largely on the ground that the people of the dominions would never tolerate any form of taxation imposed by a Parliament not sitting within their own borders.

But, though imperial federation be in the existing state of public opinion an impossibility, it does not follow that a satisfactory scheme is not any nearer than it was before the war. The effects of the war seemed indeed in 1921 to be working in two directly opposite directions. On the one hand the war brought about a greater knowledge of Great Britain and its people among the many thousands of dominion soldiers who were in England when training or on leave, and had thus created bonds of mutual affection and sympathy. (The feeling embodied in the well-known warning, "No Englishman need apply," is now, we are told, in Canada a thing of the past.) Again, the visits of the Prince of Wales to the dominions in 1919–21 called forth an expression of loyalty and devotion to the monarchy, as embodying imperial unity, and to the individual Prince, as embodying in its most attractive shape at once the youth and the democratic spirit of these new nations, such as promised well for the permanence of the British connexion.

Upon the other hand, the war, with its consequences, was, as was inevitable, a forcing-house in the development of the political status of the dominions, and hastened the putting forward of claims which might otherwise have lain dormant for many more years. During the peace negotiations dominion statesmen sat at the council table as representatives of their own communities, and not as mere assessors to the British representatives, their countries being recognized, for certain purposes, as separate states. At the signing of the Peace, King George, in each case, acted on the advice of the minister representing each individual dominion separately. Lastly, the dominions became full members of the League of Nations, undertaking, individually, the many serious obligations involved by such membership. These privileges, Sir Robert Borden has explained, were not obtained without struggle; but the opposition in no case came from the British Government.

Moreover, whilst the international position of the British Empire was thus being modified, General Smuts, the protagonist of the movement to reconcile complete local autonomy with the permanence of the Empire, was explaining the measures necessary to make theory to harmonize with practice. (It should be remembered that General Smuts was at the same time denouncing secession as at once a violation of the South African Constitution and a blow aimed at the British population.) No shred of authority, General Smuts insisted, must remain with the British Parliament or the Colonial Office. When dominion matters were in question the King must act exclusively on the advice of his dominion ministers, and, accordingly, the Governor-General must be appointed on their recommendation. Whence it follows that the only link left between Great Britain and the dominions is the personal link of the Crown, and that, logically, the dominions should have separate diplomatic representation in every capital. A beginning had been made in 1921 in the latter direction by the decision to appoint a Canadian minister at Washington, though it was doubtful how far such an appointment was really demanded by Canadian public opinion.

It is obvious how difficult under the new system might become the position of a constitutional monarch who found himself called upon to act in several different ways, on the advice of separate ministers, whose policies might be wholly discordant. When General Smuts first broached his views in 1917 he laid great store on the necessity for frequent meetings of the Prime Ministers of the British Commonwealth of Nations, with the object of insuring a common and collective policy; but latterly, under the stress of local conditions in South Africa, and perhaps under the influence of a natural impatience with the situation in Europe, this side of the shield seems to have been less before his attention.

At the Imperial Conference of 1917 it was agreed that the readjustment of the constitutional relations of the component parts of the Empire should form the subject of a special imperial conference, to be summoned as soon as possible after the cessation of hostilities; and it was settled provisionally that the conference should take place in 1922; but it seemed clear by 1921 that, in the reaction following upon the efforts of the war, any immediate attempt to draw closer the bonds of union would not meet with a favourable reception. To judge from the criticisms made on Lord Jellicoe's suggestions, the dominions were not yet prepared to contribute a fixed proportionate quota to the cost of the imperial navy. Underlying, however, this attitude of caution and distrust, there was still in reserve that spirit which made the Empire one in the supreme crisis of its history, the World War.

Other difficulties, besides the constitutional problem, beset the British Empire during the decade. Of these none caused greater anxiety than the treatment accorded to British Indians in the British dominions. With regard to immigration, it had become generally recognized in 1921 that each dominion had the right to make, and to enforce, such rules as it deemed necessary for its own individual interests. No sane Englishman would venture to quarrel with the policy of a white Australia, or with the consequences it may entail. Similarly, if the Union of South Africa, with its huge black population, refuses admission to British Indians, no complaint can be made. But it is a matter

of the utmost importance, in the interests of the Empire as a whole, that such Indians as have already found a home there should receive fair and generous treatment. The recognition of a modified form of self-government in India under the system known as "dyarchy" and the extension of representative institutions have greatly stimulated the political consciousness of the peoples of India; and things are now noted and resented which a few years earlier would have been treated as matters of course. The presence of Indian representatives at the Imperial Conferences of 1917 and 1918 served to bring home to the minds of dominion statesmen the new status obtained by India in the British Commonwealth of Nations, and the need for a new spirit in dealing with its population. Rules against Indian immigration could be reconciled with Indian dignity when reciprocal measures by India were formally sanctioned, and the hardships of existing laws with regard to the introduction of the wives of those already domiciled, or with regard to facilities for temporary or occasional visits, admit of easy mitigation. More difficult is the question of the franchise. In the past the argument has been that, as Indians had no voice in public affairs at home, they could not resent being treated in a similar way in a dominion. But now that they have begun their political apprenticeship in India itself the case is different; and, at the meeting of the Prime Ministers in 1921, the Indian representatives having laid great stress on the necessity of finding a remedy for this grievance, the conference, "in the interests of the solidarity of the British Commonwealth," recognized the desirability of granting citizenship to Indians lawfully domiciled in a dominion. It is significant, however, that the representatives of South Africa were unable to accept this resolution.

Nor is it in the dominions alone that this difficulty has been encountered. The Highlands of British East Africa (Kenya Colony) have developed into a white man's land, and Kenya is probably on its way to full responsible government. But Indians have for generations resorted to the shores of East Africa, and Indians have held that British East Africa's destiny lay in becoming a field for Indian immigration, under the British flag. The complete failure of such expectations, and the treatment accorded to British Indians in Kenya Colony by the British settlers, have doubtless been a contributory cause in promoting feelings of distrust and suspicion in India.

Under the Peace of Versailles a new form of colonial possession came into being. It seemed impossible, both in the interests of the natives and for military reasons, to restore to Germany the colonies that had been taken during the war. At the same time it did not appear seemly that a war, fought for moral ends, should be followed by a mere division of the spoil. The "mandatory" system was, therefore, evolved; the aim of which is to enforce the lesson that the possession of colonies, inhabited by savage or semi-civilized peoples, entails moral obligations toward such peoples. Accordingly their tutelage is entrusted to advanced nations who, by reason of their resources, their experience, or geographical position, can best undertake this responsibility, and who thus become mandatories on behalf of the League of Nations. The character of the mandate is differentiated according to the stage of development of the people, the geographical situation of the territory, its economic conditions, and other similar circumstances.

There are three kinds of mandates. Under the first (class A) the mandatory power stands in the position of administrative adviser and assistant until such time as the dependent community may be able to stand alone; its existence as an independent nation being provisionally recognized, subject to the execution by the mandatory of its trust.

In the case of the second form of mandate (class B) the population, as in German East Africa (assigned mainly to Great Britain), was still at the stage in which the mandatory must be exclusively responsible for the administration of the country; under conditions, however, which would guarantee freedom of conscience and religion (subject to the maintenance of public order and morals); the prohibition of abuses, such as the slave trade, traffic in arms or in liquor; and would prevent the establishment of fortifications or military and naval bases, and the military training of the natives for other than police purposes and actual defence. In territories under this form of mandate equal opportunities must be given for the trade and commerce of all nations belonging to the League of Nations.

Lastly (class C) there were territories, such as German South-West Africa and certain of the islands in the Pacific south of the Equator (assigned to the Union of South Africa and to Australia and New Zealand), which, owing to the sparseness of their population, their small size, or their remoteness from the centres of civilization, or their geographical contiguity to the territory of the mandatory Power, could be administered most conveniently under the laws of the mandatory as integral portions of its territory; but subject to the safeguards above mentioned in the interests of the indigenous population.

The recognition of this last class was, in great measure, due to the exigencies of the British dominions. The Union of South Africa, Australia and New Zealand were all countries having a protective tariff. Had their new possessions come under the provision applying to class B, they must either have set on foot different tariff arrangements in their possessions or else have incurred the obligation to throw open their commerce to all members of the League.

That the League of Nations intended to take very seriously its work under the mandatory system was shown by the amendments proposed by the sub-committee of the executive committee which dealt with the British draft of the mandate for Tanganyika. Amongst other alterations of a stringent character it was proposed that, on the coming into force of the mandate, "all lands not already alienated by regular title, whether occupied or unoccupied," should be declared "native lands," and that no native lands should be alienable, a provision which would apparently render impossible any kind of European colonization or development. The further proposal that any person in the territory should be able, through the medium of the mandatory Power, to bring complaints to the League with regard to the non-observance of the terms of the mandate might, conceivably, lend itself to abuse, in the event of such complaints being manufactured or encouraged for political purposes.

With regard to trade relations, there was no movement during 1910–21 in the direction of an imperial Zollverein. In Canada the party that in opposition had denounced protection had found insuperable difficulties in the way of changing the policy of their predecessors and contented themselves with maintaining the British preference. But the effect of reciprocity with the United States, had it come into force, must have been to diminish the advantage to British trade of such preference. In these years, whilst the policy of preference for British goods gained in favour throughout the dominions, it was seldom advocated unless it could be accompanied by a general raising of the scale of the general tariff. In Great Britain the Unionist leaders had found themselves faced with the difficulty of proposing duties upon primary articles of food; and the revised platform merely demanded a preferential treatment of goods produced in the Empire which were already subject to duties, a modest proposal which was carried into effect by the budget of 1919.

At the 1911 Conference Sir W. Laurier, tired of general discussions in which neither party was able to convince the other, made the practical proposal that a peripatetic Royal Commission should be set on foot, to take stock of the existing resources of the Empire, and to consider how trade might be increased between its component parts. This commission did much useful work in the years before the war; and the appointment of new trade commissions in the different dominions and colonies had the effect of stimulating trade with Great Britain. Unfortunately, in the special circumstances which were the aftermath of the war, there were more formidable obstacles in the way of the expansion of British trade than ignorance or indifference on the part of possible customers.

In another direction the war has had regrettable results. Nothing can help so much to promote imperial unity as a cheap postage system, both for letters and for newspapers, and cheap

facilities for travel. But the taxation necessitated by the cost of the war, and the increase in prices generally, gave a rude set-back in these directions. Conquests of the air may eventually help to solve the problems of time and space—the Prime Minister at the Conference of 1921 decided upon an extension of wireless telegraphy and on the retention of existing material useful for the development of imperial air communications, but in 1921 the condition of things prevailing had been made less favourable to habits of intercourse between the members of the scattered Empire than it was at the beginning of 1914.

As regards the Crown colonies, the period, until the changes brought about by the war dealt with above, was one concerned with the development of the existing possessions rather than with the acquisition of new ones. Great attention was paid to the solution of the problems connected with the natives, with, on the whole, satisfactory results; *e.g.* the recognition by cotton experts that cotton-growing in the Empire can be more successfully carried on under a system of cultivation by small native proprietors than under the system of large plantations owned by Europeans, with its attendant moral dangers, has gone some way to remove the standing crux of colonial administration—how to combine the due development of the material resources of these countries with the necessary safeguarding of the moral interests of the native populations. Similarly, the treatment of the land question has shown more and more respect for native customs and ideas. The amalgamation of Northern and Southern Nigeria in 1914 enabled the development of the largest British Crown colony or protectorate to be carried on with greater speed and efficiency. In Northern Nigeria, as in the Federated Malay States, a system is at work which, when conditions are favourable, gives admirable results. The native chiefs govern their subjects without the existence of direct communication between the British officials and the people. The difficulty in the way of the employment of this system more generally is that it requires both strong and upright native rulers and British residents of no little tact as well as ability. Whatever be the system of government, it is clear that the interests of a numerous native population must not be abandoned to the will of a small minority of educated and Europeanized natives, who are wholly akin to their countrymen in aims and ideals, any more than they should be the victims of the needs of the few European settlers. The establishment in Nigeria, side by side with an extended executive council, of a new council, including amongst its members the leading official and unofficial representatives both of the European and of the native community, enables the Government to keep in touch with such public opinion as can find expression. A council of this kind may play a useful part, although it has no direct executive or legislative powers. During the war the striking loyalty of the Mohammedan states in Northern Nigeria and the attitude of the natives throughout the British colonies bore witness to the soundness of the principles upon which the British native policy has been built. There are, no doubt, serious difficulties in the way. The effects in the more civilized communities of a superficial and ill-assimilated education tend to increase indiscipline and vanity amongst the young; whilst the gradual weakening of the tribal system, and of the authority belonging to the chiefs, is fraught with danger. But the experience of British East Africa has shown that, in a country where the disintegrating forces are exceptionally strong, something may be done by skilful administration to revive the tribal authority and to resuscitate the native tribunals. Everywhere it has been made clear that no form of compulsory labour on behalf of private employers can be tolerated. The question of taxation, with the view of developing the natives' inclination to work, has given rise to difficulties. Attention may be called to the system prevailing in Papua, under the Australian Commonwealth Government, where the proceeds of such taxation are strictly earmarked for purposes connected with the interests of the aborigines.

A marked feature of the period has been the extension of railways which followed upon the financial success of the so-called Uganda railway. In East Africa there has been established a network of railways, steamers and roads, extending into the heart of the Uganda protectorate, and tapping a vast area of country; whilst in West Africa the progress has been no less noticeable.

In the Far East the addition, in the beginning of 1914, of Johor to the number of the Federated Malay States was an event of importance, the undeveloped resources of the country being great. In no quarter of the world has the British system of government met with more success than in the Malay Peninsula. The wonderful wealth of the country has, no doubt, made things easier—nowhere else could a first-rate railway system have been built entirely out of revenue; and the establishment of the plantation rubber industry upon a large scale, before its introduction into other countries, enabled the pioneers to reap the benefits of high prices. Nor was the British Government unmindful of the interests of the natives, special legislation being passed to prevent them from yielding to their natural inclination to alienate their ancestral holdings to European capitalists. The spontaneous gift of the battleship "Malaya" to the British navy by the Federated Malay States in 1912 attested the popularity of the British rule; and even more striking were the expressions of loyalty from the Asiatic population at the outbreak of war, followed by a voluntary annual contribution towards its expenses which had the warm support of the unofficial members of the Council. An economic reaction inevitably occurred after the fictitious prosperity caused by the high prices that prevailed during the war, but such depression was in no way connected with the system of government.

In the West Indies the years 1910–21 saw few changes of importance. Criticism of existing political conditions had come more to the surface, and proposals were more often heard for the establishment of a federal system of government. In Jamaica the attempt is being made to interest the unofficial members of the Legislative Council more closely in the work of the Government. With regard to federation, the difficulties in its way, in the case of islands separated from each other by hundreds of miles of sea and possessing different forms of government and different ideals and prejudices, remain as great as ever; but the work of the imperial department of agriculture for the West Indies has tended to promote economic development generally; and the agreement, setting on foot a system of reciprocal trade preference, made between Canada and the West Indies in 1917 should be of benefit to the latter.

Parliamentary papers, the Annual Reports from the Crown Colonies and Dominions, Hansards, together with A. B. Keith, *Imperial Unity and the Dominions* (1916), are the best authorities for the last 11 years of the British Empire. With regard to the future form of its constitution R. Jebb, *The Britannic Question* (1913), L. Curtis, *The Problem of the Commonwealth* (1917), and H. Duncan Hall, *The British Commonwealth of Nations* (1920) represent different points of view. (H. E. E.)

BROADBENT, SIR WILLIAM HENRY, 1st Bart. (1835–1907), English physician, was born at Lindley, Yorks., Jan. 23 1835, the son of a woollen manufacturer. Educated at Huddersfield, he afterwards studied medicine at Owens College and the Royal School of Medicine, Manchester, and at Paris. From 1859 to 1896 he was physician to St. Mary's hospital, London, and from 1860 to 1879 physician to the London Fever hospital. In 1893 he was created a baronet, and in 1898 became physician extraordinary to Queen Victoria, an office in which he was continued by King Edward VII. Broadbent was an authority on heart affections, and also carried out much research on tuberculosis. His chief works are *The Pulse* (1890), and *The Heart* (1897). He died in London July 10 1907, and was succeeded in the baronetcy by his son, now Sir John Broadbent, Bart. (b. 1865), also a distinguished physician.

BROADHURST, HENRY (1840–1911), English Labour leader and Liberal politician, was born at Littlemore, near Oxford, April 13 1840, the son of a stonemason. He was educated at the village school, and at the age of 13 was apprenticed to his father's trade. He worked at it for nearly twenty years, going to London finally in 1865, where he was employed in the erecting of the House of Commons. In 1872 he was elected chairman of the masons' committee during a strike, and from

that time was prominent as a trade union official. In 1875 he was elected secretary of the parliamentary committee of the trade union congress. He entered Parliament in 1880 as Liberal member for Stoke-on-Trent. In 1885 he was elected for the Bordesley division of Birmingham, and in Feb. 1886 was appointed under-secretary to the Home Office, going out with the Gladstone Government later in the year. He belonged to the older school of trade unionism and was opposed to such demands as an 8-hour day fixed by law. His moderate policy was defeated at the trade union congress of 1890, and he then resigned his secretaryship. Both in 1892 and 1893 he was unsuccessful in his parliamentary candidatures. In 1892 he was appointed a member of the royal commission on Labour, and in 1894 he was elected Liberal member for Leicester, which seat he held until 1906, when he retired on account of ill health. He died at Cromer Oct. 11 1911. He published the story of his life in 1901, and a book on *Leasehold Enfranchisement* in conjunction with Lord Loreburn in 1885.

BROCK, SIR THOMAS (1847–). English sculptor (*see* 4.623), was in 1911 created K.C.B.

BROCKDORFF-RANTZAU, COUNT ULRICH VON (1869–). German diplomatist, was born May 29 1869 at Schleswig. After having held various diplomatic positions at St. Petersburg, Vienna and Budapest he was appointed German minister at Copenhagen, a post which he held from 1912 to 1918. He was very active in the Danish capital during the World War in collecting news and keeping in touch with the various international agencies which were interested in paving the way for peace or endeavouring to undermine the war spirit of the Western Powers. On Dec. 20 1918 he was appointed Secretary of State for Foreign Affairs and in March 1919 went to Versailles as chief of the German delegation for the peace negotiations. He resigned on June 20 in consequence of his unwillingness to advise the German Government to accept the terms of the Treaty of Versailles.

BROOKE, SIR CHARLES JOHNSON (1829–1917), 2nd Raja of Sarawak (*see* 24.208), died at Cirencester May 15 1917. He was succeeded by his eldest son, Charles Vyner Brooke (b. 1874).

BROOKE, RUPERT (1887–1915), English poet, was born at Rugby Aug. 3 1887, and educated at Rugby and King's College, Cambridge, where he afterwards won a fellowship. In 1911 he issued his first volume of *Poems*. In 1913 he undertook a journey through America and on to Samoa, sending home vivid letters, which recall those of R. L. Stevenson, to a London evening paper; they were published after his death in volume form as *Letters from America* (1916) with a prefatory appreciation by Henry James. These two books and a second and posthumous volume of poetry *1914 and other Poems*, with an essay on *John Webster and the Elizabethan Drama* (1916), make up his literary output; but its quality and high promise render the greater the loss to English literature by his premature death on active service. He had joined the Naval Brigade very early in the World War, took part in the ill-fated effort to relieve Antwerp, spent the winter in an English camp and went out to Gallipoli in the spring, but on the way there fell ill of blood-poisoning and died at sea in a French hospital ship April 23 1915. He was buried on the island of Lemnos. His *Collected Poems*, with a prefatory memoir by Edward Marsh, were published in 1918.

BROOKE, STOPFORD AUGUSTUS (1832–1916), English divine and man of letters (*see* 4.645), died at Ewhurst, Sur., March 18 1916.

See L. P. Jacks, *Life and Letters of Stopford Brooke* (1917).

BROOKFIELD, CHARLES HALLAM ELTON (1857–1913), English actor and playwright, was born in London May 19 1857, and educated at Westminster and Trinity College, Cambridge. He studied law for a time at the Inner Temple, though he was never called to the bar, and he was for several years on the staff of the *Saturday Review*. In 1879 he took to the stage, appearing first in *Still Waters Run Deep* and becoming a member of the Bancrofts' company at the Haymarket theatre, London, from 1880 to 1885. Later he played there with Herbert Tree in *Jim the Penman*, *The Red Lamp* and other melodramas, as well as in Oscar Wilde's *An Ideal Husband*. But it was rather as a wit and a writer that his reputation was gained, his stories and *mots* becoming famous. He wrote alone, or in collaboration, a number of lively plays, of which the best known was *Dear Old Charlie*, and he published his *Random Reminiscences* (1902). He also collaborated with his wife, Frances Mary Brookfield, in an account of his parents *Mrs. Brookfield and her Circle* (1905). Frances M. Brookfield was also the author of *The Cambridge Apostles* (1906) and of some notable novels, especially *My Lord of Essex* (1907) and *A Friar Observant* (1909). In 1911 Brookfield was appointed joint-examiner (censor) of plays under the Lord Chamberlain—an appointment which had an element of humour in view of the character of some of his own plays. He died in London Oct. 20 1913.

BROUGH, FANNY WHITESIDE (1854–1914), English actress, who came of a well-known family of actors, was born in Paris July 8 1854. She first appeared on the stage at Manchester in 1869 in a pantomime written by her uncle, William Brough. In 1870 she appeared in London with Mrs. John Wood at the St. James's theatre. She played in *Money* with the Bancrofts in 1872, in *The Wife's Secret* and *The Ironmaster* with the Kendals in 1888, and in *The Man from Blankley's* with Charles Hawtrey in 1901 and again in the United States in 1903. She died in London Nov. 30 1914.

BROUGHTON, RHODA (1840–1920), English novelist, was born in N. Wales Nov. 29 1840, the daughter of a clergyman, who was squire as well as rector of Broughton, Staffs. She produced her first novel, *Cometh up as a Flower*, in 1867, following it at brief intervals by *Not Wisely but too Well* and *Red as a Rose is She*. In the English county society, in which she had been brought up, such novels were then regarded as too daring experiments, to be kept as far as possible out of the hands of the young. But this *succès de scandale* was short-lived and, as mid-Victorianism began to fade, Miss Broughton's reputation as a shocker of convention soon gave place to a more sober recognition of her merit as a story-teller. "I began life as Zola," she said of herself, "I finish it as Miss Yonge." In the interval she had spent 20 years in Oxford, where she was a distinguished social figure, and the last 30 years at Richmond as a semi-invalid, and she had published some 20 novels, the latest, *A Fool in her Folly*, appearing after her death, with a prefatory appreciation by Marie Belloc-Lowndes. She died at Headington near Oxford, June 5 1920.

BROWN, FRANCIS (1849–1916), American Semitic scholar (*see* 4.658), died in New York Oct. 15 1916. He had been president of Union Theological Seminary, New York, since 1908. In 1911 he was tried for heresy before the Presbyterian General Board on the ground that he had published statements "contrary to cherished Presbyterian and evangelical doctrines," but was exonerated.

BROWN, JOHN GEORGE (1831–1913), American painter (*see* 4.661), died in New York City Feb. 8 1913.

BROWN, PETER HUME (1850–1918), Scottish historian, was born in Haddingtonshire Dec. 17 1850, and educated at Edinburgh University, where he afterwards became professor of ancient history. In 1908 he was appointed Historiographer Royal for Scotland, and from 1913 to 1914 Ford lecturer at Oxford. Besides his various histories, he is the author of a *Life of John Knox* (1895) and is mentioned as an authority in the bibliography of John Knox (*see* 15.882). He died at Edinburgh Nov. 30 1918; his unfinished *Life of Goethe* was completed by Lord Haldane and published in 1920.

BROWNE, SIR BENJAMIN CHAPMAN (1839–1917), British engineer, was born at Stout's Hill, Glos., Aug. 26 1839 and was apprenticed to the Elswick works near Newcastle-on-Tyne. He became an expert on harbour work and carried out harbour works at Tynemouth, Falmouth and in the Isle of Wight. In 1870 he took over the locomotive works of R. & W. Hawthorn at Forth Banks, in 1886 combined these with those of Andrew Leslie & Co., and until 1916 was chairman of

the combination. He was knighted in 1887. He died at Westacre, Newcastle-on-Tyne, March 1 1917.

BROWNING, JOHN M. (1854–), American inventor, was born at Ogden, Utah, in 1854, of Mormon parentage. His father was a gunsmith. The son, from childhood, displayed remarkable talent for invention. In 1879 he secured his first patent for a breech-loading single-shot rifle. He made 600 of these guns in his Ogden shop before selling the patent to the Remington Company. He designed many types of sporting firearms such as the Remington autoloading shotguns and rifles; the Winchester repeating shotguns, single-shot and repeating rifles; the Stevens rifles; and the Colt automatic pistols. From all these he drew large royalties. In 1890 a machine-gun of his design, but known as the Colt, was adopted by the U.S. army. He always avoided publicity and in no case required that his invention bear his name. In one establishment alone was his name used, the Fabrique Nationale at Liége, Belgium, which fell into the hands of the Germans at the beginning of the World War, in 1914. Browning had shortly before been made a chevalier de l'Ordre de Léopold and decorated by King Albert, on the occasion of the completion of the millionth Browning automatic pistol at Liége. He later developed two types of machine-gun which were adopted by the United States in 1918 for use in the World War. One of these guns on test fired 30,000 rounds before breakage developed. In lieu of royalties, which would have amounted to some $10,000,000, he accepted from the U.S. Government a lump sum of $1,500,000.

BRUCE, SIR DAVID (1855–), British bacteriologist, was born at Melbourne May 29 1855. He was educated at Stirling high school and Edinburgh University, where he took his degree of M.B. in 1881. He entered the R.A.M.C. in 1883, and from 1884 to 1889 served in Malta and Egypt. His stay in Malta was marked by his researches into the origin of Malta fever, and in 1887 he discovered the micro-organism of this disease, propounding the theory that it was spread by the use of goats' milk (*see* 17.514). In 1889 he became assistant professor of pathology at Netley, and in 1894 went to South Africa, where he remained until 1901, serving throughout the South African War. In 1902 he became a member of the Army Advisory Board, a post which he retained until 1910. For many years Bruce conducted researches into the origin of sleeping-sickness, and in 1894 he discovered the micro-organism not only of that disease but also of nagana (tsetse fly disease), and the method of their dissemination. In 1903 he went to Uganda as director of the Royal Society's commission for the investigation of sleeping-sickness, and in 1904 proceeded to Malta to carry on further investigations into Malta fever, returning to Uganda in 1908. In every case a great advance in the study of tropical medicine was the result. From 1911 to 1914 he was in Nyasaland, investigating the possible connexion between human and cattle diseases, and in 1914 became commandant of the Royal Army Medical College, holding the post till 1918. Bruce, who was knighted in 1908, was created K.C.B. in 1918 and retired in 1919. He published many papers on tropical diseases.

BRUCE, SIR GAINSFORD (1834–1912), English judge, was born in 1834. He graduated at Glasgow University and was called to the bar in 1859. He joined the northern and afterwards the north-eastern circuit, and during 1869–1882 reported Admiralty and ecclesiastical cases for the *Law Reports*. His strength lay in Admiralty law, and he made several contributions to its literature, notably an edition of Williams and Bruce's *Admiralty Practice*, and the 4th edition of *Maude and Pollock on Shipping*. He was recorder of Bradford during 1877–92, and successively solicitor-general (1879) and attorney-general (1886) to the county palatine of Durham. A Conservative in politics, he represented Holborn in Parliament from 1888 till he was raised to the bench in 1898. He was made a privy councillor on his retirement in 1904. He died at Bromley, Kent, Feb. 24 1912.

BRUGES, Belgium (*see* 4.678).—Pop. 53,595 in 1914. In 1914, 685 vessels of 316,000 tons entered the port, and just prior to the World War the improvement of transport between the town and Zeebrugge promised to restore its former prosperity. The Hôtel de Louis de Gruthuuse (who was given the title of Count of Winchester by Edward IV.) was converted into a museum of antiquities about 1890.

Up to Oct. 10 1914, Bruges was the headquarters of the British force that was first sent to Belgium after the outbreak of the World War. The town remained some 20 m. behind the German front at Dixmude and was at first of little military importance, but with the growth of submarine warfare and the abandonment of Ostend as a naval base, it became important as a place for the assembling of parts of submarines brought overland from Germany. Capt. Fryatt, of the steam packet "Brussels," was shot in the cavalry barracks of the rue Longue on July 27 1916. The town remained in the hands of the Germans until Oct. 19 1918.

BRUNNER, HENRY (1840–1915), German historian (*see* 4.685), published in 1909 *Geschichte der englischen Rechtsquellen im Grundriss*. In 1913 he issued a sixth edition of *Grundzüge der deutschen Rechtsgeschichte*. He died in 1915.

BRUNNER, SIR JOHN TOMLINSON, 1st Bart. (1842–1919), British chemist, was born at Everton near Liverpool Feb. 8 1842, the son of a schoolmaster of Swiss nationality. Educated in his father's school he entered a Liverpool merchant's office in 1857, and in 1873 established, with the distinguished chemist Ludwig Mond (*see* 18.693), the alkali works at Northwich which became the largest in the world. He was a member of several royal commissions, represented Northwich in Parliament during 1885–6 and again from 1887 to 1909, was created a baronet in 1895 and a privy councillor in 1906. His public benefactions, especially to Northwich and Runcorn, were numerous, and he also gave largely to Liverpool University. He died at Chertsey July 1 1919.

BRUNTON, SIR THOMAS LAUDER, Bart. (1844–1916), British physician, was born at Hiltonshill, Roxburgh, March 14 1844. He was educated at Edinburgh, where he graduated M.B. in 1866 and M.D. in 1868, also studying for short periods at Leipzig, Berlin, Vienna and Paris. In 1870 he was appointed assistant physician to St. Bartholomew's hospital, with which he was connected for the rest of his life, both as physician and lecturer. One of his most noteworthy discoveries was the introduction of nitrate of amyl for the relief of angina pectoris (1867). In 1886 he was a member of the commission which investigated the Pasteur discoveries, and in 1889 went to Hyderabad on the invitation of the Nizam to conduct experiments on the results of the administration of chloroform. He was knighted in 1900 and created a baronet in 1908. Lauder Brunton published various valuable works, including *A Text-Book of Pharmacology, Materia Medica and Therapeutics* (1892); *Lectures on the Action of Medicines* (1897) and *Therapeutics of the Circulation* (1908). He died in London Sept. 16 1916.

BRUSSELS, Belgium (*see* 4.692).—The pop. of the city proper in 1920 was 156,024, showing a decrease since 1910 of 39,645, due to the expropriation and demolition of houses for public improvements. The total pop. of Greater Brussels (comprising ten suburbs and including the recently annexed suburb of Laeken) was 831,396 on Jan. 1 1920. The most populous suburbs at the same date were Schaerbeek 108,590, Ixelles 91,056, Molenbeek, 77,708, St. Gilles 60,716, Laeken 43,729, Forest 32,926.

The various areas composing the city having certain interests in common, notably the maintenance of police and charitable services, a *Conférence des bourgmestres*, on which 15 communes were represented, was instituted in 1909, but subsequently the unification of areas was resisted by the greater number of the larger communes. A law of April 2 1921, however, initiated by the burgomaster, Adolphe Max, decreed the annexation to Brussels proper of the communes of Laeken, Haeren, and Neder Overheembeek, as well as part of Molenbeek, and a small part of Schaerbeek, in order to facilitate the construction of the proposed new outer port which the authorities wished to bring entirely within area of the city proper. As a result, the area of the city proper has more than tripled; it covers 3,286 hectares 94 ares instead of 1,071 hectares 95 ares, and includes an additional pop. of about 54,000.

During 1910–21 Brussels underwent considerable transformation. The old harbour basins were filled in in 1910; the Isabelle quarter of the city, situated between the rue Royale and the Place Royale,

as well as the Putterie quarter near the university, were demolished in order to make room for a new central station, which project, however, seemed in 1920 unlikely to materialize, the Nord-Midi junction being abandoned. Numerous banks were established in the upper town—in the rue Royale and Place Royale. In the Schaerbeek area, new arterial roads were made and the Parc Josaphat was endowed with a fine sports ground. The palace of the Count of Flanders became the Banque de Bruxelles, and, in Nov. 1918, the city acquired the palace of the Duc d'Arenburg, and gave it again its old name of Palais d'Egmont.

The harbour works—planned in 1896 for making Brussels an inland seaport, including the widening of the canal and the construction of three large basins, the largest of which, the Vergote basin, has 20,000 metres of quayage—were completed in 1908. These being found inadequate, the construction of a vast outer port in the plain between Laeken and Vilrode was begun. As an outcome of this undertaking, Laeken was brought within the city area.

The German occupation of the capital during the World War extended from Aug. 1914 to Nov. 1918. General Sixt von Armin's troops entered on Aug. 20, and on Sept. 2 Field-Marshal von der Goltz was appointed governor-general of Belgium, but was succeeded by General von Bissing in 1915. Numerous social relief movements were instituted outside of German intervention; among them the *Comité National de Secours* had its headquarters at Brussels, and with the aid of Mr. Hoover's American committee organized the feeding of the Belgian population. On the suppression of Allied newspapers, a patriotic journal, *La Libre Belgique*, was secretly printed in Brussels and widely circulated during the war, the Germans being unable to discover the press from which it issued. Among the many infamous executions, that of Philippe Baucq and of Nurse Edith Cavell stand out. A revolt of German soldiers against their officers broke out on Nov. 10 1918, and a violent conflict occurred in the Place Roger opposite the Gare du Nord. The Belgian army reoccupied Brussels on Nov. 18 1918, and the King and Queen reëntered the city in state on Nov. 22.

BRUSSILOV, ALEXEI (1856–), Russian general, was born in 1856. His military career began in the Caucasus. His courage and capacities brought him to notice in the war with Turkey in 1877–8. The greater part of his military life was passed at the cavalry school for officers in St. Petersburg, of which he became director in 1900. Well acquainted with cavalry technique, of great erudition, he was very useful in this capacity. In 1905 General Brussilov commanded the second guard cavalry division, in 1909 an army corps, and somewhat later he was assistant to the commander-in-chief of the Warsaw military district. At the beginning of the World War he was nominated commander of the Russian VIII. Army, which acted with brilliant success in Galicia in 1914 and 1915. General Brussilov's reputation grew steadily, and in the winter of 1915–6 he was called to the command of the armies of the south-western front. During the summer of this year he conducted the great offensive in Galicia, which resulted in the capture of over 450,000 prisoners, with enormous booty and trophies, and the relief of the Italian army by the withdrawal of considerable enemy forces thence to meet the crisis of Lutsk. In May 1917 after the revolution he was appointed to the supreme command, but he did not hold the appointment long. Later, he accepted the Bolshevik régime, and was often, though erroneously, reported to be in supreme command of the Bolshevik armies during the wars of 1919–20.

BRYAN, WILLIAM JENNINGS (1860–), American political leader (*see* 4.697), announced that he was not a candidate for the Democratic presidential nomination in 1912, but he attended the Democratic convention, and it was largely owing to his personal influence and his large popular following that the nomination went to Woodrow Wilson. In 1913 he was appointed by President Wilson Secretary of State, and from the start devoted much attention to the negotiation of peace treaties with foreign countries. He declared that America should wage no war while he was Secretary. Soon after entering office he went to California and urged, unsuccessfully, that the state Legislature and the governor delay action on the proposed Webb anti-alien land ownership bill, so displeasing to the Japanese Government. In 1914 he supported the repeal of the Panama Canal tolls bill, which excluded American coastwise shipping from the payment of fees. After the outbreak of the World War he was deeply interested in attempts to restore peace. His attitude toward foreign war loans was clearly expressed in an announcement from the Department of State (Aug. 15 1914), that "There is no reason why loans should not be made to the governments of neutral nations, but in the judgment of this Government loans by American bankers to any foreign nation which is at war is inconsistent with the true spirit of neutrality." When, however, in Dec. of the same year, Senator Hitchcock introduced a bill to lay an embargo on the shipment of arms, the Secretary informed the British ambassador that it had not been introduced "at the suggestion of the administration"; and later, in 1915, in a letter "to the German Americans" he declared that it would have been in violation of the laws of neutrality to change international rules during war by forbidding the exportation of arms. After the sinking of the "Lusitania," in 1915, he signed the first strong note of protest to Germany. Upon the receipt of the German reply, and while the second note was being prepared, Dr. Dumba, the ambassador of Austria-Hungary, called at the Department of State and asked Secretary Bryan why the United States dealt more harshly with Germany than with Great Britain. The Secretary replied that Great Britain had only interfered with the commerce of the United States while Germany had drowned its citizens. This plain statement was ignorantly or wantonly misinterpreted by some German official, and the report was widely spread that Mr. Bryan had said that the note was for "home consumption," and not to be taken too seriously. There was, however, absolutely no truth in this report, even Dr. Dumba denying it in a dispatch to his Government. When the President wrote his second "Lusitania" note, Secretary Bryan resigned, June 8 1915, saying in his letter of resignation: "You have prepared for transmission to the German Government a note in which I cannot join without violating what I deem to be an obligation to my country."

During his term of office he had negotiated 30 treaties with foreign nations, requiring the submission of disputes to impartial inquiry and a delay of a full year for arbitration before going to war. Such a treaty had not been concluded with Germany, but was under consideration when interrupted by the World War. As Secretary he was often criticised because of numerous paid engagements on the lecture platform, undertaken, he said, to supplement his inadequate salary; but it was never shown that he was less attentive to the demands of his office than any predecessor. He continued, after his resignation, to work in the interests of peace; opposed the Anglo-French war loan; attacked the Navy League and the National Security League; and tried to resist the growing demand for preparedness in America. In 1916 he was defeated in Nebraska as candidate for delegate-at-large to the Democratic National Convention. He went, however, as a reporter and gave full support for the renomination and later the reëlection of President Wilson. From the announcement by Germany of the resumption of submarine warfare to the actual declaration of war, he favoured any measure that would keep America out of war no matter how largely it involved the surrender of American rights on the sea. But when war was declared he asked to be enrolled as a private, though then 57 years of age; urged loyal support of the President's war measures; and in his own paper, *The Commoner*, strongly condemned obstruction of the selective draft as well as abuse of liberty of speech. He supported the League of Nations but thought that the Monroe Doctrine should be specifically recognized. He desired a constitutional amendment changing the two-thirds vote required in the Senate for making a treaty, so that the country could get out of war as easily as it got in. In 1920 he attended as a reporter for his paper both the Republican and the Democratic National Conventions and worked in vain for a dry plank in their platforms. The same year he was tendered the presidential nomination of the Prohibition party but declined. He was disappointed with the nomination of James M. Cox as Democratic candidate, but

declared that he would not leave the party. For the most important "progressive" measures adopted by the United States in recent years, the popular election of senators, an income tax, the requirement of publication of ownership and circulation by newspapers, the creation of a Department of Labor, national prohibition and woman suffrage, Bryan laboured earnestly, and their adoption was due in part at least to his popular persistent appeal.

BRYANT, SOPHIE (1850–), British educationist, was born in Dublin Feb. 15 1850, the daughter of the Rev. W. A. Willock. She was educated privately, but later gained a scholarship to Bedford College, London, where she graduated with honours in mathematics and moral science (1881). At the age of 19 she married Dr. William Hicks Bryant, of Plymouth, but on his death a year later resumed her work, and in 1884 took the degree of D.Sc. in moral science, being the first woman to take that degree. In 1875 she became mathematical mistress at the North London Collegiate school for girls, and in 1895 succeeded Miss Buss as its headmistress. Dr. Bryant served on the royal commission on secondary education (1894), and was a member of various educational committees. She retired from her post at the North London Collegiate school in 1918.

She published, besides many articles on scientific and educational subjects, *Educational Ends* (1887); *The Teaching of Morality in the Family and the School* (1897) and *How to Read the Bible in the Twentieth Century* (1918); besides *Celtic Ireland* (1889), and *The Genius of the Gael* (1913).

BRYCE, JAMES BRYCE, 1ST VISCOUNT (1838–), British jurist, historian, politician and diplomatist (*see* 4.699), remained in the United States as British ambassador till 1913, a period of six years. The appointment, criticised at the time as withdrawing from the regular diplomatic corps one of its most coveted posts, proved a great success. The United States had been in the habit of sending, as minister or ambassador to the Court of St. James's, one of its leading citizens—a statesman, a man of letters, or a lawyer—whose name and reputation were already well known in Great Britain. For the first time Great Britain responded in kind. Mr. Bryce, already favourably regarded in America as the author of a classical work on the American Commonwealth, made himself thoroughly at home in the country; and, after the fashion of American ministers or ambassadors in England, he took up with eagerness and success the rôle of public orator on matters outside party politics, so far as his diplomatic duties permitted. These duties he performed to the satisfaction of his own Government and the Government to which he was accredited. The difficulty between America and Newfoundland about fisheries was referred to the Hague Tribunal for final settlement. Most of the questions with which he had to deal related to the relations between the United States and Canada, and in this connexion he paid several visits to Canada to confer with the governor-general and his ministers. He was criticised, both in England and in Canada, for forwarding, in 1911, in the course of his duties as ambassador, an arrangement for reciprocity between the two North American states; but the general election, which substituted Sir R. Borden as Prime Minister of Canada for Sir W. Laurier, put an end to the negotiations. At the close of his embassy he told the Canadians that probably three-fourths of the business of the British embassy at Washington was Canadian, and of the 11 or 12 treaties he had signed nine had been treaties relating to the affairs of Canada. "By those nine treaties," he said, "we have, I hope, dealt with all the questions that are likely to arise between the United States and Canada—questions relating to boundary; questions relating to the disposal and the use of boundary waters; questions relating to the fisheries in the international waters where the two countries adjoin one another; questions relating to the interests which we have in sealing in the Behring Sea, and many other matters." He could boast that he left the relations between the United States and Canada on an excellent footing.

For his services he was created a viscount in 1913, and in 1914 his old university, Oxford, gave him an honorary degree. Along with other English scholars, who had ties of close association with German learning and German savants, he was extremely reluctant in the last days of July 1914 to contemplate the possibility of war with Germany; but the violation of Belgian neutrality and the outrages committed in Belgium by German troops brought him speedily into line with national feeling. He was appointed chairman of a strong committee to consider the evidence of such outrages not only in Belgium but in France; and his report convinced the most incredulous of the reality of the charges. He welcomed warmly the entrance of the Americans into the war in the spring of 1917. He also presided, as an eminent constitutional lawyer, over a committee set up in that year to consider the reconstruction of the House of Lords, and spent much labour in a task which all parties were disposed to shirk. During these latter years he was largely engaged on the composition of a valuable book, published in two substantial volumes, in 1921, on *Modern Democracies*, a comparative study of a certain number of popular governments in their actual working. For this monumental work he had been gathering material for several years before the war. Besides visiting Switzerland and other parts of Europe, he availed himself of his experiences in the United States and in Canada, and journeyed to Spanish America, Australia and New Zealand. Lord Bryce married, in 1880, Elizabeth Marion, daughter of Thomas Ashton, of Hyde, and sister of the 1st Lord Ashton of Hyde. He was appointed O.M. in 1907 and G.C.V.O. in 1918.

BUCCLEUCH, WILLIAM HENRY WALTER MONTAGU-DOUGLAS-SCOTT, 6TH DUKE OF (1831–1914), British politician (*see* 4.712), died at Montagu House, Whitehall, Nov. 5 1914. He married in 1859 Lady Louisa Hamilton, daughter of the 1st Duke of Abercorn, and one of the seven sisters depicted by Disraeli in *Lothair*. She was an intimate friend of the royal family, and was mistress of the robes to Queen Victoria and Queen Alexandra. She died at Dalkeith March 17 1912.

BUCHAN, ALEXANDER (1829–1907), British meteorologist, was born at Kinneswood, Kinross, April 11 1829. He was educated at the Free Church normal school and the university of Edinburgh. From 1848 to 1860 he worked as a teacher, but in 1860 was appointed secretary to the Scottish Meteorological Society, and in 1869 published his first series of monthly charts showing the mean distribution of atmospheric pressure over the globe, which remained for many years a landmark in the progress of meteorology. In 1878 he became curator of the library of the Royal Society of Edinburgh, and in 1887 a member of the meteorological council of the Royal Society. He published a *Handy Book of Meteorology* (1867); *Introductory Textbook of Meteorology* (1871); besides a report on *The Weather and Health of London* (with Sir Arthur Mitchell), and edited sections on *Oceanic Circulation* (1895) and the volume on *Atmospheric Circulation* (1889) in the voyage of H.M.S. "Challenger." He received the Makdougall-Brisbane prize (1876) and the Gunning Victoria Jubilee prize (1893) of the Royal Society of Edinburgh, besides the Symons medal of the Royal Meteorological Society, and was elected a fellow of the Royal Society in 1898. He died at Edinburgh May 13 1907.

BUCHAN, JOHN (1875–), British author, was born at Perth Aug. 26 1875, the son of the Rev. John Buchan. He was educated at Glasgow University and Brasenose College, Oxford, where he won the Stanhope historical essay prize (1897) and the Newdigate prize for poetry (1898), and graduating first class in *literae humaniores* (1899). In 1901 he became private secretary to Lord Milner, then High Commissioner for South Africa, and remained with him till 1903. In 1906 he joined the Edinburgh publishing firm of Thomas Nelson & Sons. Even as an undergraduate he had "commenced author" with *Sir Quixote* (1895), and he followed this with other tales and novels. His African experiences suggested *The African Colony* (1903), *A Lodge in the Wilderness* (1906), and *Prester John* (1910). During the World War he served with the headquarters staff of the British army in France (1916–7), attaining the rank of colonel, and later was Director of Information under the Prime Minister (1917–8), and his *History of*

the War (Nelson) was an admirable piece of work. He wrote too some excellent tales of adventure, notably *The Thirty-Nine Steps* (1915) and *Greenmantle* (1916). Later works include *The South African Forces in France* (1920), and a biography of *Francis and Riversdale Grenfell* (1920).

BUCKLE, GEORGE EARLE (1854–), English editor and man of letters, was born at Tiverton-on-Avon, Som., June 10 1854, eldest son of Canon George Buckle of Wells. He was educated at Winchester and New College, Oxford, being a scholar of his college, and graduated first class both in *literae humaniores* (1876) and in modern history (1877). He won the Newdigate prize poem in 1875. In 1877 he was elected to a fellowship at All Souls College, which he held until 1885. In 1880 he joined the staff of *The Times;* four years later, at the age of thirty, he succeeded Thomas Chenery as its editor. This position he occupied for nearly thirty years, retiring in Aug. 1912. When Mr. Monypenny, the biographer originally entrusted with the official *Life* of Disraeli, died in 1912 leaving his task unfinished, Mr. Buckle took over the work of completing it; under his authorship vol. 3 was published in 1914, vol. 4 in 1916, and the concluding vols. 5 and 6 in 1920.

BUCKMASTER, STANLEY OWEN BUCKMASTER, 1ST BARON (1861–), English lawyer and politician, was born at Wandsworth Jan. 9 1861. He was educated at Christ Church, Oxford, and in 1884 was called to the bar, becoming a K.C. in 1902. He entered politics as a Liberal, and in 1906 was elected M.P. for Cambridge. In 1910 he lost his seat, but in 1911 was elected for the Keighley division of Yorks., and the same year became counsel to Oxford University. In 1913 he was made solicitor-general and knighted. He was from Sept. 1914 to May 1915 director of the Press Bureau. In the latter year he was Lord Chancellor, being raised to the peerage, but was displaced on the fall of the Asquith Government in 1916.

BUCKNER, SIMON BOLIVAR (1823–1914), American soldier and political leader (*see* 4.732), died in Munfordville, Ky., Jan. 8 1914. He was the last surviving major-general of the Confederacy and the then oldest living graduate of West Point.

BUCKNILL, SIR THOMAS TOWNSEND (1845–1915), English judge, was born at Exminster April 18 1845, the son of Sir John Charles Bucknill (1817–1897), a famous mental specialist. He was educated at Westminster school, and afterwards at Geneva. He was called to the bar in 1868, became a Q.C. in 1885, and a bencher of the Inner Temple in 1891. From 1885 to 1899 he was recorder of Exeter. He sat as Conservative member for Mid-Surrey from 1892 to 1899, in which year he was raised to the bench and knighted. He died at Epsom Oct. 4 1915.

BUDAPEST (*see* 4.734).—In 1910 the civil pop. of Budapest was 863,735, showing an increase of 20·55% in the decade. To this must be added a garrison of 16,636 men, making a total pop. of 880,371. Of the total pop. 756,070 were Magyars, 78,882 Germans, 20,359 Slovaks and the small remainder was composed of Poles, Ruthenians, Serbs, Croatians, Rumanians and others. According to religion there were 526,175 Roman Catholics, 9,428 Greek Catholics, 6,962 Greek Orthodox, 86,990 were Protestants of the Helvetic and 43,562 of the Augsburg Confessions, 203,687 were Jews and the remainder belonged to various other creeds. During the World War the extraordinary increase in the population of Budapest diminished, the census Jan. 1 1921 showing a pop. of 1,184,616.

In the years immediately preceding the war there were over 6,000 students at the university, and from 4,000 to 5,000 at the Polytechnic Institute. A new faculty of political economy was founded at the university in 1919, and the Geological and Meteorological Institutes are also of recent foundation.

The new Tisher rampart in Romanesque-Gothic transition style, with a bronze statue of St. Stephen, rises round the Matthias church. At the N. extremity of the fortress is the Gothic building of the National Archives, unfinished in 1921.

The development of Budapest came to a standstill during the war, and the lack of housing accommodation caused great distress among the increased population. The city suffered severely during the Bolshevist ascendancy, and many robberies were committed by the Rumanian troops who occupied it in disregard of the decisions of the other Allied Powers (*see* HUNGARY). Fortunately, the English, American and Italian missions prevented the sacking of the museums and art galleries.

See Eugen Cholnoky, "The Geographical Position of Budapest," *Bulletin of the Hungarian Geographical Society*, 1914–20, abridged.

BUDGE, SIR ERNEST ALFRED WALLIS (1857–), English archaeologist, was born in Cornwall July 27 1857 and educated at Christ's College, Cambridge, where he became Assyrian scholar and Tyrwhitt Hebrew scholar. In 1885 he became keeper of the Egyptian and Assyrian antiquities in the British Museum, and he conducted excavations at Assuan, at Gebel Barkal on the island of Meroe (the site of the capital of ancient Ethiopia), at Nineveh and Der in Mesopotamia (1888–9) and in the Sudan, when the ancient monuments on the banks of the Nile were threatened with inundation by the raising of the Assuan dam. His long list of publications includes *The Gods of Egypt* (1903); *The Egyptian Sudan* (1907); *The Nile* (1910; 12th ed. 1912); *Literature of the Ancient Egyptians* (1914); *By Nile and Tigris* (1920), and very many others. He was knighted in 1920.

BUENOS AIRES (*see* 4.752) continued to be in 1921 the largest city in Latin America, the largest city in the world south of the equator and the fourth city in the two Americas, being exceeded only by New York, Chicago and Philadelphia in the order named. In total shipping, Buenos Aires ranks as the second port in the two Americas, coming directly after New York. The pop. in 1920 was 1,676,041, an increase of 486,379 or 38 %, since 1909, when Buenos Aires had 1,189,662 inhabitants, and an increase since 1914 of 184,062, or 12 %. It will be seen that the relative growth for the period 1914–20 was not so great as previously. This is partly accounted for by the fact that between 1914 and 1918 there was a balance against Argentina in migration of 213,000 people; however, this movement turned the other way in 1919, and in 1920 the balance resulted in favour of Argentina by 39,800. A large proportion of immigrants remain in Buenos Aires, in spite of the efforts of the Argentine Government to distribute them. In 1919, only 6,675 building permits were granted, as against 19,538 in 1910.

The celebration of the Argentine Centenary in 1910 in Buenos Aires drew many visitors not only from all Argentina, but also from abroad. In 1913 new diagonal avenues were begun, the plan being to change the rectangular pattern which had been followed since the colonial period by cutting diagonal avenues through the city on the model of Washington and Paris. The two chief new ones were to radiate from the corners of the central Plaza de Mayo, formerly the chief central square of the city. In 1921 only about five blocks of each of these avenues had been completed, the World War putting a stop to the extensive expenditures upon the project, which involved the widening of alternate streets coming from the river and the demolition of many of the older parts of the city. The parkway lying between the city proper and the Rio de la Plata was greatly improved during the 10 years 1910–20, much land was reclaimed from the river, and a new post-office and custom-house were erected on this parkway, adding greatly to its beauty. The centenary gifts of various nations to Argentina now adorn important parts of Buenos Aires. Among them may be especially mentioned the handsome clock tower erected by the British colony at a cost of £50,000, which stands opposite the new railway station opened in 1916 (the largest railway station in South America), the statue of George Washington in Palermo Park erected by the U.S. colony, and other statues from the French, Syrian and other foreign communities. The statue erected by the Spanish colony in Palermo Park is particularly beautiful.

The Congress building was finished in 1912 and the park in front of it, the Plaza del Congreso, covering three city blocks, was opened for the centenary celebrations in 1910, over $500,000 having been spent.

Buenos Aires transacts approximately 80 % of the entire foreign trade of the republic. It continues to be preëminently the banking, as well as the industrial, centre of the country. The first branch of a U.S. national bank ever established abroad was opened in Buenos Aires Nov. 10 1914, by the National City Bank of New York. Since then two other U.S. banking institutions have opened branches there. The number of U.S. business houses in Buenos Aires increased from 10 in 1910 to 80 in 1920, while the British and French firms and those representing other Allied countries also became more numerous. The war was very injurious to German

enterprises in Buenos Aires, many of them practically going out of business.

Other improvements in the decade 1910–20 were the erection of a number of thoroughly modern hotels and of a greatly improved immigration station; the opening of 80 new parks and plazas; the construction of several new school buildings; the extension and enlargement of the medical faculty of the university of Buenos Aires; and the erection of the large building which houses its faculty of commerce. Improvements in sanitation and sewerage have also been effected and a new subway was installed in 1912 by a German firm. Several large modern office buildings have been put up since 1916, chiefly with English capital, and new department stores, almost wholly operated with English capital. (C. L. C.)

BUFFALO (*see* 4.754).—The population in 1920 was 506,775, an increase of 83,060 or 19.6% for the decade, as compared with 71,328 and 20.2% for the preceding decade. The death-rate of Buffalo in 1920 was 12.08, the average from 1900 to 1920, 15.18. In 1914 a new commission charter was adopted which did away with the bicameral city council and mayor formerly in existence. The first commission government took office Jan. 1 1916.

The citizens choose by direct non-partisan nomination and election a mayor and four councilmen. These constitute the sole legislative body and are also the chief executive heads. The mayor is *ex officio* the head of the departments of fire, police and health, which comprise the Department of Public Safety. The four other departments are Finance and Accounts, Public Works, Parks and Public Buildings, and Public Affairs. A councilman is appointed as head of each of these departments. The principal subordinate officials are nominated by the mayor and appointed by the council. The mayor has a vote in the council, but no veto power. All ordinances and appropriations for purposes outside ordinary city expenses may be referred to vote of the people on petition of 5% of the citizens who voted at the last regular election for mayor.

The schools are under a board of education appointed by the mayor and council, but subject mainly to state laws. The city court, consisting of a chief judge and seven associate judges, is also under state law. A technical and four other high schools were built between 1902 and 1920. The sum of $8,000,000 was appropriated for new grammar schools in 1919. The university of Buffalo was given an endowment fund of $5,200,000, raised by popular subscription, in 1920. In 1909 it acquired a site of 106 ac. in the northern part of the city, to which 44 ac. were added in 1919. Canisius College (Jesuit) also, in 1920, raised by popular subscription an endowment fund of $1,000,000. D'Youville College for women (Roman Catholic) was opened in 1908. Among important new structures may be mentioned: Marine Trust Co., Erie County Savings Bank, New York Telephone, Electric, Iroquois and Y.M.C.A. buildings. The new city hospital was under process of development in 1921. The city also maintained the J. N. Adam memorial hospital for tuberculous patients at Perrysburg, N.Y.

The new Erie canal, rebuilt by the state as a barge canal at a cost of $150,000,000, was opened for traffic in 1919. It provides water transportation to the seaboard for barges up to 2,000 tons' capacity and drawing not more than 12 ft. of water, adding greatly to the city's commercial facilities. The city completed in 1915 a new pumping station and tunnel 6,500 ft. long, by which water is brought from Lake Erie. The capacity of the plant is 150,000,000 gal. each 24 hours.

The city's greatest growth in recent years has been in manufactures. It has very diversified industries, producing 58% of all the different lines of goods recognized by the United States Census Bureau. Among the chief manufactures are: iron and steel products, meat products, soap, cars, flour, lumber, linseed oil, clothing, automobiles, etc.

The grain elevators in Buffalo harbour had in 1920 a capacity of 28,500,000 bushels. The receipts of grain by lake boat in 1920 were 108,825,000 bushels. Receipts of flour approximate 5,000,000 bar. yearly. More than 20,000 carloads of live stock are handled yearly in the stock-yards at East Buffalo. Other important articles of commerce are: iron ore, in which Buffalo stands second in receipts among the lake ports; coal, flax-seed, manufactured iron and steel and lumber.

Buffalo furnished over 10,000 volunteers and selected service men to the U.S. army in the World War. The greater number of these served in the 77th and 78th divisions and had an active part in the Argonne and other battles. In addition, the 74th Infantry, N.G.S.N.Y., became the 108th Infantry in the United States service; the Third Field Artillery, N.G.S.N.Y., became the 106th Field Artillery; Troop I, N.G.S.N.Y., became the 102nd Trench Mortar Battery, and Base Hospital No. 23 was recruited in Buffalo. The 108th regiment, forming a part of the 27th division, participated in the breaking of the Hindenburg line near Le Cateau, France, Sept. 29–Oct. 1 1918. The 106th Field Artillery and 102nd Trench Mortar Battery were in the battle of the Argonne. Nearly 4,000 Buffalo men served in the navy and about 1,000 in the U.S. marine corps. There were also over 600 Buffalo men who volunteered for the Polish army. The Buffalo men who died in the war numbered 966.

Recent important books on the history of the city are *History of Buffalo* (1911) by J. N. Larned, and *An Old Frontier of France* (1917) by F. H. Severance. (M. M. W.)

BULGARIA (*see* 4.772). *Political History 1908–12.*—The condition of Macedonia and Thrace, which since the Treaty of Berlin in 1878 had been a constant source of anxiety and difficulties for Bulgaria, became even worse under the régime of the Young Turks. The Serbs, whose hopes of reunion with their own kin and of an outlet on the Adriatic had been destroyed by the annexation of Bosnia and the Herzegovina by Austria-Hungary in 1908, began to seek expansion in Macedonia towards the Aegean. Rival bands of Serbs, Greeks, Bulgars, Wallachs, Albanians and Turks now carried on the propaganda of their respective nationalities in Macedonia by force of arms, and the life of the peasant became unbearable. The perpetual menace of war with Turkey and, latterly, the strained relations with Greece and Serbia, entailed on Bulgaria a military expenditure which in 1909 was proportionately higher than that of any other European state. Bulgaria was obliged, moreover, to support thousands of destitute refugees who had escaped over her frontier from Turkish territory; current consular reports stated that the Bulgarian population of Macedonia had diminished to a quarter of what it had been 15 years earlier. There was again a fear that the Young Turks meant to exterminate the Bulgars of Thrace and Macedonia altogether, and the Macedonians living in Sofia, many of whom were men of ability and influence, were continually urging the Government to take energetic steps with regard to Macedonia.

The Balkan Alliance.—In March 1911, the Malinov Cabinet fell and Gueshov, head of the Nationalist party, became president of the council. Balkan statesmen were slow to realize that it was to their common interest to put an end to the troubles in Macedonia, and that this could be done only by joint action. In the winter of 1910–1, negotiations in this direction were begun at Athens between Bulgaria and Greece, the first negotiations taking the form of private conversations between J. D. Bourchier, principal *Times* correspondent in the Balkans, and Venizelos. Eventually, Venizelos entrusted Bourchier with the transmission to King George of a definite proposal which was known only to King George, Venizelos and Bourchier; the greatest secrecy was observed throughout, even after the matter had been put on a diplomatic footing. In June 1911, the Grand Sobranye empowered the Government to make secret treaties without submitting them to the Sobranye. In May 1912, a treaty of defensive alliance between Bulgaria and Greece was signed, but this treaty was kept entirely secret for the next two months. Meanwhile, negotiations had also taken place between Bulgaria and Serbia, and in Oct. 1911, the Serbian premier, Milovanovitch, and Gueshov came to a general agreement as to terms of an alliance. The negotiations with Serbia proved difficult throughout. The Bulgars were in favour of autonomy for Macedonia; the Serbs, in favour of dividing the country into three zones, an uncontested Serbian zone, an uncontested Bulgarian zone and a contested zone, the fate of which should be left to the arbitration of the Tsar of Russia. After much discussion in which both sides showed an uncompromising spirit, a treaty of friendship and alliance, with a secret annex, was signed in Sofia on March 13 1912. By this treaty Serbia recognized "the right of Bulgaria to the territory E. of the Rhodope Mountains and the river Struma"; while Bulgaria recognized "a similar right of Serbia to the territory N. and W. of the Shar Mountains"; if autonomy for the rest of Macedonia was found to be impossible, the two states bound themselves to accept an agreed line running southwestwards from Golem Mountain to Ochrida Lake, should the Tsar of Russia pronounce in favour of this line. Russia was kept informed of the negotiations; the Tsar's Government, while it welcomed the *rapprochement* between the three Orthodox states, discouraged active measures, but events in Turkey tended to force the hands of the allies. In June 1912, the Young Turk Government fell; a serious Albanian rising led to the concession of a measure of autonomy to the Albanians; there was a bomb outrage at Kochen, followed by a massacre of Bulgars by Turks; Bulgaria considered herself menaced by proposed Turkish military manoeuvres near Adrianople. The Great Powers, which had by the autumn become aware of the Balkan alliance, made efforts to prevent the outbreak of war, which culminated in a proposal from Austria-Hungary that the Powers should guarantee

the autonomy of Macedonia. Unfortunately, the offer came many years too late. On Sept. 30, the Balkan allies ordered the mobilization of their armies, and on Oct. 8 Montenegro, with which country no formal agreement had been made, declared war on Turkey. On Oct. 13, the allied Balkan Powers sent a virtual ultimatum to the Porte; on Oct. 17, Turkey declared war on Serbia and Bulgaria, and on Oct. 18 Greece declared war on Turkey.

First Balkan War 1912–3.—The war with Turkey was popular throughout the country, for the people of Bulgaria, though they are often represented as self-centred and materialistic, had felt the sorrows of their kinsfolk in Macedonia as their own, and were prepared for any sacrifices in order to set them free. The campaign in Thrace brought out once more the admirable qualities of the Bulgarian soldier, his power of endurance, his courage and his obedience to discipline, but the success of the campaign was in reality less complete and satisfactory than it appeared to be in press accounts. The Bulgars, it is true, forced the Turkish army back in disorder, after severe fighting near Kirk-Kilisse and Lule-Burgas, to the strong defensive position of the Chatalja lines; but, owing to lack of heavy artillery, they failed to capture Adrianople and proved unable to force the Chatalja lines and so to advance on Constantinople. For all its supplies, the army was dependent on ox transport; nearly every cart and draught animal in Bulgaria had been requisitioned. The rough tracks by which supplies had to travel had been rendered almost impassable by rains, and it was fully ten days' trek from the railhead at Yambol to Lule-Burgas; there was heavy mortality among the draught animals. The enforced pauses, whilst the army was waiting for supplies to come up, twice gave the Turks time to withdraw and finally permitted them to reorganize their forces at Chatalja. The campaign had revealed great shortcomings in the medical and supply services, and the Bulgars suffered only a degree less cruelly than the Turks themselves from shortage of food and absence of sanitary and medical care. The assaults on Chatalja, which cost the Bulgars some 10,000 casualties, were undertaken contrary to the advice of Fichev, chief of staff, and were inspired by Ferdinand, whose ambition it was to take Constantinople regardless of the cost. Fichev, who had realized that the troops were too much exhausted after the five weeks' fighting in Thrace to follow up their success to complete victory, was compelled by the King to ask for sick leave and was succeeded by Nerezov.

On Dec. 4 an armistice between Turkey, Bulgaria and Serbia was signed. At this moment the position was everywhere favourable to the allies. The Greeks, who did not sign the armistice, had occupied most of southern Macedonia and held Salonika. The Serbs, after heavy fighting at Kumanovo and Prilep, had taken Monastir, and the Turkish army had retreated into Albania. The Turkish fortresses of Scutari, Yanina and Adrianople still held out, but their garrisons were suffering from shortage of supplies. The signatories of the armistice met in London to arrange terms of peace. The Bulgarian demands, which included the *vilayet* of Adrianople and the port of Rodosto on the Sea of Marmora, seemed likely to be accepted by the Turks, but a *coup d'état* in Constantinople brought the Young Turk party back to power, and as the Young Turks seemed as determined to hold Adrianople as the Bulgars were to obtain it, the conference was broken up. On Feb. 3 1913, hostilities again began. Yanina surrendered early in March, the Serbs and Bulgars entered Adrianople almost simultaneously on March 25, and Scutari fell a month later. After the surrender of Adrianople, the Turks sought the mediation of the Powers, and after another conference in London, the delegates were, on May 30 1913, induced to sign a treaty, the terms of which had been drafted by the Powers. Turkey surrendered to the allies all her possessions in Europe up to a line drawn from Enos on the Aegean to Midia on the Black Sea, Midia being about 63 m. from Constantinople. Albania was granted independence. The Bulgarian casualties in the war were officially given as 93,000 while the Serbian and Greek official figures of their respective casualties were given as 31,000 and 29,000.

Rupture of Balkan Alliance.—The discussions at the conferences in London had shown that considerable friction existed between the allies. Apart from the antagonism of national character and the mutual distrust and dislike, which events in Macedonia during the last few years had accentuated, the difficulties which now presented themselves arose from the interpretation of the treaties of alliance. The military successes of the allies had been unexpectedly complete, and had thus created a situation which had not been foreseen in the treaties of alliance. The Serbs claimed that as new conditions had arisen, the treaties should be revised as a whole, and the arbitration of the Tsar should be sought for all matters in dispute. The Bulgars characteristically held out for the letter of the agreement as regards territorial arrangements, and they were, moreover, unwilling to submit even the contested zone to the arbitration of the Tsar, as they doubted his impartiality. By Article 2 of the secret annex to the treaty between Bulgaria and Serbia (March 13 1912), it had been agreed that "all territorial gains acquired by combined action . . . shall constitute the common property (*condominium*) of the two allies," and the lines of partition, to be effected within a period of three months after restoration of peace, were then laid down. Serbia, however, as a result of her victories in Macedonia, held much of the territory which had been assigned by the treaty to Bulgaria; whereas Bulgaria held Adrianople and all Thrace, a situation which had not been provided for in the treaty. Moreover, Greece occupied Salonika (where a Bulgarian detachment had been left for political reasons) and many districts of southern Macedonia in which Bulgars formed a majority of the population. It was impossible for Bulgaria to give up her claim to Macedonia, where the bulk of the inhabitants were of Bulgarian nationality, as it had been for their sake that she had made immense sacrifices; on the other hand, since Serbia was now cut off from the Adriatic by the creation of an Albanian state, Serbia was naturally anxious to have access to Salonika, without having to pass through Bulgarian territory before reaching the Greek frontier. Controversy also arose as to the fulfilment of the terms of the military convention of June 1912, in which it had been agreed that Bulgaria and Serbia should each, "if no other special arrangement be made," send at least 100,000 men to the Vardar theatre of war. Serbia asserted that Bulgaria had sent only 32,000 men to the Vardar theatre, whereas Serbia had voluntarily sent 50,000 men to Adrianople to help the Bulgars, and she claimed that, without the Serbian heavy artillery, that fortress could not have been taken. It must, however, be remembered that the Thracian campaign had proved the longest, the most difficult and the most costly of the allied operations, and that the taking of Adrianople was essential to the allied cause as a whole. The Serbs, again, attributed the prolongation of the campaign to the *intransigeance* of the Bulgarian delegates in London. It was evident that there was never mutual confidence between the allies, and that personal contact between the respective armies had often given rise to friction rather than good-will. Bulgarian suspicion of Serbian designs was intensified by an official circular written by Pashich in the autumn of 1912, in which he spoke of Prilep and Ochrida as belonging to Old Serbia, although both these places were within the zone allotted to Bulgaria. In Jan. and March 1913, meetings took place between Prince Alexander of Serbia and Prince Nicholas of Greece, and Bulgaria had reason to suspect that some agreement was made as to combined action against herself. The occupation by Serbia and Greece of regions of Macedonia which had not been actually allocated by treaty to either Power seemed to Bulgaria to be assuming a permanent character. The murder of King George of Greece in March 1913 meant the removal of a factor which made for peace and moderation, whereas in Bulgaria, the military party, with whom King Ferdinand was in full sympathy, had, by the early spring, gained ascendancy over the policy of the country. In April a Cabinet council was held at Adrianople when, according to Gen. Savov, it was decided to retain in Thrace only such armed forces as were absolutely necessary for defence, and to transfer the rest of the army as quickly as possible against the Greeks and Serbs in Macedonia. There were good reasons for haste, for the military authorities, with the King at their head, were now convinced that war was inevitable, and, moreover, they were aware that the troops were becoming increasingly anxious to return to their homes. The concentration of troops on the Macedonian frontier was gradually effected during June. The Serbs, on their part, had not failed to make corresponding preparations on the other side of the frontier. On June 1 Gueshov and Pashich, both of them men of moderate and prudent views, met in the hope of coming to an agreement; on the same day a treaty was signed at Salonika between Serbia and Greece. During the month of June the Tsar of Russia put all possible pressure on Serbia and Bulgaria, both directly and through his diplomatic representatives, Hartwig at Belgrade and Nekludov at Sofia, to prevent the outbreak of hostilities, but Ferdinand's replies to the Tsar's proffered mediation showed an increasing arrogance. On May 30 Gueshov, finding that his policy of caution and moderation was not supported by the King, resigned: his place was taken by Danev, a politician who stood well with the military party and who had shown marked intractability as delegate to the London conference. On June 19 a speech by Tisza in the Hungarian Parliament indicated that Austria-Hungary considered that the Balkan states should be free to choose their own method of settling their differences.

Second Balkan War.—On June 29 the Bulgarian Fourth Army, acting on orders signed by Gen. Savov, made the treacherous attack on their Serb and Greek allies which alienated from Bulgaria the sympathy and respect of Europe, and proved the first step towards her downfall. The manner of the attack was unjustifiable, but it must be remembered that the attack was not unexpected, and that it probably forestalled a declaration of war on Bulgaria by Serbia and Greece. The treaty of June 1 between Serbia and Greece, the concreted entrenchments at Ovche Polye, the secret orders given by the Serbian commander-in-chief, Gen. Putnik, ten days before the attack and King Peter's proclamation, issued to the troops on July 1, must count as evidence that the Serbs were fully alive to the situation. On July 1 Savov forbade further hostilities; he himself was recalled a few days later. It has been officially stated that the reports of the ministerial council contain no minute ordering the opening of hostilities against the Greeks and Serbs June 29 1913, and Danev denied in the press that his Government had ever contemplated such orders. A judicial inquiry into the causes of the second Balkan War was opened in Sofia, but was never concluded. Savov asserted that the King himself, as commander-in-chief,

gave the order to attack. The war which was so rashly and unjustifiably started by the Bulgars ended in disaster for them. They were driven back on their own frontier by the Serbs and Greeks and on July 10 the Rumanians, who had given previous warning of their intentions, crossed the Danube and advanced unopposed on Sofia. A few days later the Turks retook Adrianople and invaded Bulgaria. Danev resigned and a Stambulovist Cabinet was formed, with Radoslavov as prime minister. Bulgaria was thus closed in by four enemies at once and had no choice but to submit unconditionally to the Rumanian terms. On July 30 an armistice was signed at Bucharest. The failure of Bulgarian arms in the second Balkan War was due to several causes. The *moral* of the troops had suffered owing to the prolongation of the campaign in Thrace and discontent had been rife; the troops were exhausted by their forced march in hot weather from Thrace to Macedonia immediately before hostilities, while many had no inclination to fight against their late allies and brother Slavs. The war was the work of politicians rather than of soldiers. Ferdinand and his *entourage* had underestimated the strength of the Serbian and Greek forces, and they had imagined that if once both these armies could be driven out of territory which had been assigned to Bulgaria by Article 2 of the secret annex to the Serbo-Bulgarian Treaty of 1912, the Powers would acquiesce in a Bulgarian occupation of that part of Macedonia, and also of Salonika. The civil population of southern Macedonia suffered cruelly during the second Balkan War; atrocities were committed both by Greeks and Bulgars.

Treaty of Bucharest.—This treaty, which was signed on Aug. 10 1913 after a fortnight's conference, deprived Bulgaria of almost all her territorial gains of the first Balkan War and also of any immediate prospect of the reunion into one state of all Bulgarian-speaking people. Rumania acquired from Bulgaria that portion of the Dobruja which had been Bulgarian since 1878, from Tutrakan on the Danube to Balchik on the Black Sea. The inhabitants of this region were almost exclusively Bulgarian and it comprised some of the best cereal-growing land which had been held by the Bulgars. Serbia and Greece divided Macedonia between them, with the exception of the mountainous region of the Perin and Despoto Dagh. Bulgaria thus retained one outlet on the Aegean, in the shallow-water port of Dede Aghach; her so-called harbour at Porto Lagos consisted only of a short length of quay and a score of buildings. Turkey regained Adrianople and most of Thrace. The Balkan Wars of 1912 and 1913 thus resulted in an increase of territory for Serbia and Montenegro by four-fifths and for Bulgaria by one-fifth, while Greece almost doubled her territory. Serbia and Montenegro increased their respective populations by three-sevenths, Bulgaria by one-twentieth and Greece by two-thirds. The total casualties of the two wars were in inverse ratio to the gains of the three states concerned, viz.:—Bulgaria, 150,000; Serbia, 79,500, and Greece, 50,000. The terms of the Treaty of Bucharest—King Charles of Rumania himself said of it: "It is not a treaty, it is only a truce and it cannot last"—were punitive rather than pacific in tendency, and the attempts of Russia, and possibly of Austria-Hungary also, to secure some modifications for Bulgaria were unsuccessful.

Radoslavov Government, 1913–4.—On July 5 1913 the Radoslavov Cabinet, at the critical moment when they assumed office, addressed a letter to the King, which was probably inspired by him, expressing their opinion that "the salvation of our State can only be found in a policy of intimate friendship with Austria-Hungary. That policy should be adopted at once and without hesitation, because every hour is fateful. We invite you to act immediately in order to save Bulgaria from further misfortunes and the dynasty from further responsibility." This letter was signed by Radoslavov, N. Ghenadiev and D. Tonchev. In the personnel of the Cabinet the King found ready tools for the pursuance of his policy; several of the ministers, including Radoslavov and Ghenadiev, had been prosecuted for corruption, peculation and illegal practices during their previous tenure of office, and Radoslavov himself had been condemned to a term of imprisonment and loss of civil rights. The elections of Dec. 1913 gave the Opposition a majority of 14 seats in the Sobranye, although the Government had resorted to the usual methods of controlling the elections. Owing to the impossibility of forming a new Cabinet, the Sobranye was dissolved. The suffrage was now extended to the territory which had been ceded to Bulgaria by Turkey by the Treaty of Bucharest. This measure was held by some to be unconstitutional, but the efforts of the Government to conciliate the new Moslem voters and the 150,000 refugees who had been settled in this region resulted in a Government majority of ten in the new Sobranye. The Turkish deputies, many of whom were members of the Committee of Union and Progress, thus held a casting vote in the Sobranye, and, through them, the Sublime Porte was able to exercise a direct influence on the Bulgarian Government. It became imperative to raise a foreign loan in order to meet the obligations of the country and for certain necessary constructive work. Appeal was made to France, England and Russia successively, but assistance was refused or else only offered on conditions which it did not suit the Bulgarian Government to accept. These conditions, however, can hardly have been more unfavourable than those eventually accepted from the German Disconto Gesellschaft which provided the loan of 500 million francs. By the terms of the loan the syndicate secured the control of the state coal mines, of the projected railway which was to connect central Bulgaria with Porto Lagos, and of that terminal port itself. These terms met with angry opposition throughout the country, for it was realized that Bulgaria was handing over some of her chief economic assets to Germany. The syndicate further sought to obtain the control of the export of tobacco, but, owing to strong expression of public opinion, the Government was obliged to refuse this demand. The consent of the Sobranye to the conditions of the loan was only obtained after violent protests from the Opposition, the uproar preventing the actual reading of the bill (June 1914).

Political Parties and Public Life.—The old broad distinctions of Russophil and Russophobe which had marked the two main political camps in the time of Stambulov, gave place later to an increasing number of subdivisions of parties, between whose respective programmes there was not always much apparent difference. Public life in Bulgaria has hitherto left a good deal to be desired; elections have not been free and ministers have not always been above reproach as regards incorruptibility, patriotism and efficiency, and they have looked on themselves as personal *employés* of the King rather than as servants of the nation. The King, who was always well informed as to the private affairs of his *entourage* and who knew their weak points, preferred ministers over whom he had a hold of this description. The Sobranye often showed itself amenable to the manipulation of ministers or of the King. In practice, a change of government meant a change in the holders of most government appointments. The King's control of the army was absolute; according to the constitution he was commander-in-chief, and the power of promotion and dismissal was in his hands. Each officer was made to feel that the success of his career depended on royal favour. There can be no doubt that Ferdinand used his undoubted talents and power in such a way as to debase rather than to elevate the moral standard of his country. The real life of Bulgaria, however, is not to be found in the bureaucracy, but among the peasants who form about 80% of the population. The peasants have no reason to like politics or politicians and they prefer to hold aloof as much as possible from both. It must be remembered that, in spite of corruption in high places, the standard of life among the peasants compares favourably as regards industry, morality and freedom from crime with that of any other European people.

Period of Neutrality (Aug. 1914–Oct. 15 1915).—At the outbreak of the World War in 1914 the great majority of Bulgars wished to preserve neutrality; from force of circumstances, however, Bulgaria was already more than half way towards the Central Powers. The policy of the Radoslavov Cabinet, the German loan, the establishment of friendly relations with Turkey, resentment against Russia for her non-intervention in Aug. 1913, together with the deep sense of humiliation and disappointment created by the Treaty of Bucharest, all combined to indicate the direction in which Bulgarian sympathy was likely to be drawn. Moreover, Macedonia, the fate of which had been the dominant factor in the policy of Bulgaria during the whole of her existence and the cause of her sacrifices in the two Balkan Wars, was now in the hands of Serbia and Greece. The Bulgarians naturally asked themselves which group of Powers would be able to help them to realize their national ideal and their material ambitions. It seemed to them unlikely that the Powers which were ranged on the side of Serbia would be willing to deprive their ally of the fruits of her victory in 1913 and to restore Macedonia to Bulgaria. The victory of the Entente might mean Russia at Constantinople, the union of the Serb peoples in one important state and the permanent loss of Macedonia. To the King, who held the direction of the policy of the country absolutely in his hands, the victory of the Entente might mean the loss of his throne and the end of his dynasty. From an early date it was clear that Turkey would join the Central Powers, while the attitude of Rumania and Greece was uncertain. Owing to her geographical position Bulgaria would evidently be unable to preserve her "benevolent neutrality" for an indefinite time. Should she abandon it, it would be to join the winning side, and there were many in Bulgaria, including the King himself, who believed that Germany was invincible.

It is not yet known at what precise moment Ferdinand secretly promised his support to the Central Powers, but the Agrarian leader, Stamboliiski, as early as Aug. 1914 accused the Government of having bound itself to the Central Powers, and there are certainly indications that the decision had been taken in the early part of 1915. The Opposition press at the outbreak of war appeared to be decidedly pro-Entente, though non-interventionist in tendency. Gueshov and Stamboliiski constantly pressed for an agreement among the Balkan states themselves.

During the year in which Bulgaria maintained her neutrality, the rival groups of Powers made considerable efforts to secure her coöperation. It may be that Ferdinand had from an early date committed himself to a line of policy, but among Bulgars it is thought that, had the Entente encouraged the Opposition, who represented the great majority of the people; had the mentality of the people been better understood; had the Entente been definite in the proposals which from time to time were put before Bulgaria; had these proposals been made at propitious and not always at unpropitious moments; had the Entente been skilful and vigorous in its propaganda, it might well have been that the people would have imposed their will on the rulers whom they hated and despised. But the Entente policy pursued no certain course: the Entente Governments were slow to recognize the importance of Bulgarian coöperation; they were unwilling to pay the price which was asked for that coöperation; they did not realize the importance of the personal element in dealing with the Bulgars and with the King. The best propaganda for the Entente was the declaration that they were fighting for the cause of small nations and for the principle of nationality, since to the Bulgar this declaration meant protection for the Bulgarian state and reunion with the Bulgars of Macedonia and Thrace.

The most propitious moment to secure the support of Bulgaria would have been at the time of the Russian successes in the Carpathians in 1915, as the old feeling for Russia had never died out among the peasants. The chances of winning Bulgaria for the Entente lessened after the failure to pass the Dardanelles in March. German propaganda was skilfully handled; war news came chiefly through German sources; Tarnowski, the Austro-Hungarian minister at Sofia, either from personality or from force of circumstances, apparently controlled the situation there. The Entente proposals were hedged about with conditions; at the end of May 1915, they offered the Enos-Midia line and the uncontested zone in Macedonia, provided that, at the end of the war, Bosnia and the Herzegovina had been united to Serbia. Early in June, Austria-Hungary promised to Bulgaria, as the price of her neutrality, all Serbian Macedonia as well as the territory claimed by Bulgaria and now occupied by Rumania and Greece. On June 15 Bulgaria replied to the Entente note, asking for more specific guarantees. During July personal pressure was brought to bear at Sofia by special missions—a British mission composed of Mr. O'Beirne, Sir Valentine Chirol and Mr. G. Fitzmaurice; a French mission, and, on behalf of Germany, by Prince Hohenlohe—while active negotiations continued with Turkish delegates. On Aug. 3 the Entente answered the Bulgarian note of June 15; the Entente offered to Bulgaria, if she declared war on Turkey, the occupation of half the non-contested zone at once, the fate of the rest of this zone and of the contested zone to be decided at the peace; the immediate occupation of Seres and the promise of Kavalla, if Bulgaria would renounce all claims to Salonika, Kastoria and Vodena; and the promise of the Enos-Midia line. As these terms involved the retrocession of certain territories and places then occupied by Serbia and Greece, the allied representatives in Belgrade and Athens had the ungrateful task of trying to persuade Serbia and Greece to give up what they had won by force of arms, as the price of Bulgaria's coöperation. Greece, inspired by Germany, refused absolutely to consider any cession of territory and Serbia, where the military party was at the time dominant, was equally *intransigeant*.

On Aug. 19 Gen. Fichev, Minister of War, who was thought to be averse to further military adventures, resigned, and was succeeded by Gen. Jekov, who had lately been acting as negotiator with the Turks. The Opposition, becoming increasingly anxious, in vain demanded that the Sobranye should meet. On Aug. 23 Italy declared war on Austria-Hungary, and on Aug. 25 Venizelos returned to power. The moment had now come when the Central Powers desired the entry of Bulgaria into the war, and the Duke of Mecklenburg, who as special personal representative of the Kaiser and from his ability and personality was known to have a strong influence on the King, was sent from Germany to make the final arrangements. On Sept. 6 a military convention and treaty between Bulgaria and the Central Powers was signed at Pless. By this convention Germany and Austria-Hungary each agreed to send six infantry divisions within a space of 30 days, and Bulgaria four infantry divisions within 35 days, against the Serbs; F.-M. von Mackensen was to be commander-in-chief of the combined force. Turkey was, if so desired, to send troops to Dede Aghach to prevent an enemy landing. Germany agreed to advance 200 million francs to Bulgaria for military expenses, and to provide as much military material as she could spare. On Sept. 10 the existence of the treaty was admitted by Radoslavov, who stated that Bulgaria was "coming in on the side of the victors." On Sept. 12 the Opposition issued a manifesto, signed by many notable Bulgars, protesting against the policy of the Government and urging all citizens to unite to prevent the fatal step; the manifesto was, however, suppressed and the Opposition then demanded an audience of the King. On Sept. 15 the Entente made a final effort to induce Bulgaria to declare war on Turkey; Macedonia was promised unconditionally and the allied troops would occupy Macedonia for the time being, if Bulgaria so desired, as a guarantee that it would eventually be handed over to Bulgaria. On Sept. 17, at 11 P.M., the King received the Opposition leaders in audience. Malinov warned the King that if Bulgaria remained neutral, she might become the battlefield between the Germans invading Serbia and the Allies who would land at Salonika; and that, if she joined the Central Powers, she would be fighting against three Balkan peoples and four Great Powers and that it would mean the end of her national existence. Stamboliiski—it was the first time a representative of the Agrarians had entered the palace—put the views of his party before the King with characteristic vigour and *brusquerie*. The Agrarians, he said, desired to preserve neutrality; they demanded the convocation of the Sobranye and the formation of a national Government. He rejected all appeal to sentiment, whether on behalf of Russia or of Germany, and he warned the King that the people were still suffering from the terrible effects of the *débâcle* of 1913 and that they had lost all confidence in their rulers, including the King himself. He told the King that after the Treaty of Bucharest, it was only the leaders of the Agrarians who prevented a general movement against the authors of the *pogrom*, among whom the King held the chief place, and that, should the King repeat the criminal act of plunging his country into war, the leaders would not check the revolt against him but would themselves head it. Tsanov, the Radical leader, spoke with equal emphasis and sincerity. An account of the audience was published, but its circulation was forbidden, and Stamboliiski was condemned to imprisonment for life on a charge of *lèse-majesté*. On Sept. 22 the terms of the Turco-Bulgarian agreement were published; the Bulgarian frontier was to follow the Tunja valley as far as the suburbs of Adrianople, including the railway station, and then to follow the left bank of the Maritsa southwards at a distance of about 2 km., thus safeguarding Bulgarian railway communication between Sofia and Dede Aghach.

Mobilization was decreed on Sept. 22, the Greek army being mobilized immediately afterwards. On Oct. 4, Savinski, Russian minister at Sofia, informed the Bulgarian Government that he had been instructed to leave the country if within 24 hours Bulgaria did not break with the enemies of the Slav cause and forthwith send away the military officers of hostile belligerent states. On Oct. 5 the Bulgarian Government replied that the mobilization was a measure of internal importance only, that the landing of Allied troops at Salonika did not tend to

reassure Bulgaria as to the friendly intentions of the Entente, and that it was impossible to send away the German officers, as, with the exception of officially accredited military attachés, there were no such officers serving with the Bulgarian army. It is still maintained by the Bulgars that no German officers arrived till after the departure of the Entente ministers. On the receipt of this note the ministers representing the Entente Powers asked for their passports and left Sofia for Dede Aghach. On Oct. 12 Bulgaria declared war on Serbia; on Oct. 15 Great Britain declared war on Bulgaria, while France and Italy declared war on her on Oct. 16 and Oct. 17 respectively.

The World War 1915–6.—The King's proclamation to his people showed the same duplicity as had marked all his diplomatic dealings with the Entente. After enlarging on his efforts to maintain neutrality, he said: "Both groups of belligerent Powers acknowledge the great wrong inflicted on us by the partitioning of Macedonia, and both belligerent parties are agreed that the greater part of Macedonia should belong to Bulgaria. Only our treacherous neighbour, Serbia, has remained obdurate to the counsels of her friends and allies. Serbia not only refused to listen to their advice, but, inspired by envy and cupidity, even attacked our territory, and our brave troops have been obliged to fight in defence of their own land. . . . Our Allies the Serbs were then (in 1913) the chief cause of our losing Macedonia. . . . The European War is drawing to a close. The victorious armies of the Central Empires are in Serbia and are rapidly advancing." Mobilization, as eye-witnesses have stated, was not effected with the willingness which marked the mobilization of 1912—there were even attempts at mutiny in some centres—though the presence in Sofia of the Macedonian divisions to whom Serbian acts of oppression in Macedonia were a burning personal wrong and not merely a pretext for war, served to stimulate public enthusiasm. When once the country was actually at war, the Opposition became silent, partly from *force majeure* and partly from patriotic motives; all Bulgars realized that the fate of their country was at stake. Malinov, to whom the King made overtures, declined to take office in the Radoslavov Cabinet, and Stamboliiski, who was perhaps the only man in the country who could have led a revolution, was already in prison. Public meetings were forbidden and a strict censorship of the press established. The Bulgarian campaign in Serbia was, in spite of gallant opposition by the Serbs, completely successful. By the end of the year the Serbian army had retreated through Albania to the Adriatic and the Entente troops had retired within the Greek frontier, which the Bulgars did not then attempt to cross, although they themselves were confident that they could have taken Salonika. But on the one hand the attitude of Greece was still uncertain, and on the other it was to the interest of Germany that Entente troops should remain at Salonika and thus reduce the numbers available for the western front. In June 1916 the Bulgarian army occupied Seres, Drama, and Kavalla. The Sobranye had met in Dec. 1915, but, in spite of the apparently complete success of the campaign, the Radoslavov Government narrowly escaped defeat in the budget debates in July 1916. Several of the Agrarian deputies who were deemed compromised by their earlier negotiations with an agent of the Entente were imprisoned, and the Government secured the return of their own supporters in their place. On Aug. 27 1916 Rumania declared war on Austria-Hungary and, in spite of the efforts of Malinov and others to induce the Government to remain neutral, Bulgaria declared war on Rumania on Sept. 1. This war was, however, more popular than the campaign against Serbia, for the resentment caused by the action of Rumania in July 1913 was specially bitter. The Bulgarian troops were, nevertheless, unwilling to cross the Danube, as they considered that their work was finished when once the Dobruja was again in their possession; some mutinies even took place. Though the Bulgarian forces here were commanded by Gen. Tochev, F.-M. von Mackensen actually directed the operations, and, almost immediately, friction developed between the allies, resulting in Tochev's supersession. The harvest of 1916 was not a good one; the whole population was rationed for meat, bread, sugar, rice, soap and salt, and considerable discontent arose when it was found that large quantities of produce, especially of wheat and eggs, were going to Germany. German officials took over the technical control of the railways, especially the Macedonian, Dobruja and Trans-Balkan lines, which were worked with great efficiency; the railway employés remained Bulgarian. The Germans did not otherwise interfere with the civil administration of the country, while, on the military side, they restricted their active intervention to the broader issues in the conduct of the campaign. In addition to the larger formations which Germany contributed to the Bulgarian fronts in accordance with the military convention, many German technical units reinforced the Bulgarian army and were allotted to the more important sections of the front: these included machine-gun, artillery, air force, wireless and railway construction units, and hospital staffs. These units were highly efficient, and, on the whole, the two personnels worked amicably together. In Nov., Monastir was taken by the allies.

1917.—In March news of the revolution in Russia roused once more the instinctive sympathy of the Bulgars for Russia. No stenographic reports of the debates in the Sobranye have been published, but it is known that the Opposition pressed their view that Bulgaria, having gained Macedonia and the Dobruja, should now retire from the war. A war credit of 350 million levas was, however, voted in March. It was by no means certain that Bulgaria's allies would allow her to retain all her gains: neither Germany nor Austria-Hungary was willing that Bulgaria should remain in northern Dobruja, and Turkey opened negotiations for the return of that portion of the Maritsa valley which had been ceded to Bulgaria by the Turco-Bulgarian agreement of 1915. During the summer secret negotiations were carried on in Switzerland between agents of the Entente and Bulgarian agents, but though Ferdinand may have been aware of the negotiations, the Bulgarian representatives lacked the authority and personality necessary for bringing matters to a definite issue. In Oct. the Kaiser visited Sofia and attempted, by the bestowal of decorations, to restore cordial relations with Bulgaria, but it was a matter of common knowledge that the personal relations between the Kaiser and the King were anything but friendly.

1918.—The winter of 1917–8 brought a further shortage of supplies and increased discontent and suffering. The Bulgarian soldier had been accustomed to campaigns which, though they entailed severe fighting and hardships, had only lasted a short time: in the Serbo-Bulgarian War of 1885 fighting had lasted a fortnight; in the first Balkan War, some six months; and in the second Balkan War, a nominal 40 days. The Bulgarian women had as a matter of course replaced the men in all agricultural work, but the Bulgarian soldiers, most of them peasant proprietors, were anxious to be at home for the harvest, and their restlessness showed itself in an increased number of desertions. Trench warfare was, moreover, peculiarly uncongenial to troops who were accustomed to open warfare. In Jan., Germany ceased to pay the annual subsidy of 50 million francs, which she had given Bulgaria since she entered the war, and after March she sent her no further supplies of munitions and equipment. The publication of President Wilson's Fourteen Points (Jan.) had great influence on feeling in Bulgaria. Relations had never been broken off with the United States, and attempts were made to induce the President to promise Macedonia to Bulgaria. Articles in praise of the United States were allowed to appear in the press, and the Bulgars, on their part, professed to be ready to desist from the offensive which was then projected, and to make a separate peace. In May, Rumania signed the Treaty of Bucharest, by which the Dobruja was ceded to the Central Powers in *condominium*, Bulgaria regaining what Rumania had taken from her in 1913. In June the Radoslavov Cabinet, which was despised and detested throughout the country, fell and the King selected Malinov to form a new ministry. The change of Government did not mean a definite change of policy, and Malinov was reproached later for not insisting at once on a separate

peace, as he fully realized that all was not going well. At home, the new Cabinet endeavoured to improve the food conditions and to put an end to the corruption and inefficiency in the public service which had prevailed under Radoslavov. After the Austro-Hungarian defeat in Albania in July, when it became necessary to extend the Bulgarian front still further, the Bulgars pressed Germany to send the help which from the first had been promised to them. Of the six German divisions guaranteed by the military convention, only three had actually materialized and when at last German troops, in response to further urgent appeals, began to arrive in Bulgaria, the Bulgarian line had already been broken, Serbs were at the frontier and Allied troops were actually invading Bulgaria. On Sept. 25 Malinov asked for an armistice and delegates left at once for Salonika accompanied by the diplomatic representative of the United States. On Sept. 30 the Armistice was signed, the Bulgars accepting the Allied terms unconditionally. Stamboliiski, who with other Agrarian deputies had been in prison since 1915, was released on Sept. 25 and went immediately to the front where there was great unrest among the troops. At one moment it seemed probable that a revolution would take place and a republic be proclaimed, and there was serious fighting outside Sofia in which many lives were lost, the German troops being employed to restore order. On Oct. 4 the King was informed by his ministers that he had better abdicate; that same night he left Sofia by train, having nominated his son Boris as his successor. His departure was received with absolute indifference by the people; there were no demonstrations either of regret or joy. Radoslavov fled the country immediately afterwards. On Nov. 28 Malinov resigned, as a protest against the installation of Rumanian officials in the southern Dobruja contrary to the terms of the Armistice. Todorov, who had been Gueshov's second in command, succeeded in forming a coalition Cabinet.

Treaty of Neuilly.—On Nov. 27 1919 the Treaty of Peace between the Allied and Associated Powers and Bulgaria was signed at Neuilly-sur-Seine, Stamboliiski signing on behalf of his country. The territorial provisions (Arts. 27–35) included the cession to Rumania of the southern Dobruja; the cession to Serbia of the Bulgarian towns of Tsaribrod and Strumitsa and the renunciation (Art. 48) "in favour of the Principal Allied and Associated Powers of all rights and title over the territories in Thrace which belonged to the Bulgarian Monarchy, and which being situated outside the new frontiers of Bulgaria . . . have not at present been assigned to any State." The Powers undertook "to ensure the economic outlets of Bulgaria to the Aegean Sea."

At the conference of San Remo in April 1920, a small portion of Eastern Thrace was assigned to Turkey and the remainder of Thrace to Greece. Bulgaria was not represented at the conference, though some 400,000 Bulgarians were concerned in the decisions as to Thrace; the Bulgarian delegate who had been sent from Sofia in the hope that the Allies would allow him to put the Bulgarian case before them was prevented by the French authorities from crossing the Italian frontier until the session had practically concluded.

The reparation (Arts. 121–146) payable to the Allies was fixed at two and a quarter milliards of francs (gold) or £90,000,000 sterling, to be paid in half-yearly instalments within 37 years; the cost of the armies of occupation and of various commissions was also to be borne by Bulgaria. The Reparation Commission, which began work in March 1921, could at their discretion reduce or postpone particular payments and could assume full control and management of the taxes and sources of revenue.

The military clauses (Arts. 64–104) provided for the disarmament of Bulgaria. The total numbers armed with rifles, including military forces, gendarmes, frontier and forest guards and police, were limited to a maximum of 33,000 men. The troops were to be recruited on a voluntary basis and to be exclusively employed for maintenance of order and frontier guard duties. All officers were to be regulars, serving for 20 consecutive years; other ranks were to serve for 12 years. Only one military training school and one State controlled munition factory were allowed. The manufacture of tanks, armoured cars, poison gas and aeroplanes, the export and import of arms, instruction in the use of arms in schools, clubs or organizations, arrangements for mobilization, new fortifications—were all prohibited. Only four torpedo boats and six motor boats were permitted, all without torpedoes and all manned by civilian crews. No artillery of calibre greater than 4·1 inches was authorized. All surplus war material had to be destroyed or surrendered within three months of the signing of peace.

Recruiting for the forces as constituted by the treaty proved very unsatisfactory, as but few Bulgars of a good stamp could be induced to leave their homes for a long period of service.

In Aug. 1919, elections were held which resulted in the following distribution of seats:—Agrarians, 86; Communists, 47; Social Democrats, 28; Nationalists, 19; Danevists, 8; Radicals, 8; Radoslavists, 3. The Agrarians had been weakened by the secession of Draghiev and his followers in 1915, and even with the support of Gueshov and the Nationalists, were in a minority in the Sobranye. Stamboliiski became prime minister. In Feb. 1920, the Sobranye was dissolved; new elections gave the Agrarians a majority of two, and in April, Stamboliiski became premier of a Cabinet composed of his own supporters. In the course of the year 1920 Bulgaria was admitted into the League of Nations.

Finance and Trade.—The following table shows the effect of the wars on finance and trade[1]:—

Year	Revenue	Expenditure	Imports	Exports
1913	£5,765,344	£4,732,832[2]	£7,571,921	£3,733,190
1914	£10,279,800	£10,270,504	£9,659,612	£6,177,000
1918	£19,244,000[3]	£19,176,560[3]		
1921	£84,628,800[3]	£95,759,232[3]		

The budget estimates for 1921–2—the financial year begins in April—thus showed a deficit of over £11,000,000. The consolidated and non-consolidated debts, including the war indemnity, amounted to £909,434,547, and, further, there was liability for military pensions, which would, for the next few years, amount to 7 or 8 million pounds annually. The outlook, according to the Finance Minister, was not very satisfactory. The debt per head of the population was £240 (as against £6 in 1912), and taxation had, in his opinion, reached the highest possible limit, viz. 500–540 levas per head. The townspeople had suffered much more than the peasants both during and after the war; according to the director of statistics, the annual bread budget for a family of five was 17 times higher in 1920 than in 1900; the meat budget was 28 times higher; and clothing showed a very large increase in price. During the World War, the savings banks had, owing to high prices for agricultural produce, shown a steady increase of deposits, but in 1919, withdrawals exceeded deposits by £800,000; and in 1920, by about £300,000. In 1920, although Bulgaria comprised 25% more land fit for cultivation than in 1911, cultivation had decreased by 20% as compared with 1911, and her production of cereals was smaller than in 1911. On the other hand, owing to the greatly increased selling price of tobacco—it had risen from 1 to 2·50 francs per kilo before the World War to 36 francs per kilo in 1919—the area cultivated in tobacco was more than double in 1920 what it had been in 1911; also the 1920 potato crop was double what it was in 1911. The attar of rose industry, which in Europe is almost peculiar to Bulgaria, naturally suffered during the wars, and only 15,000 ac. are now under rose cultivation; it is estimated that, although the demand for rose essence is now increasing, several years must pass before the industry is fully reëstablished and equipped with modern machinery.

Bulgaria's international trade had always been primarily with Austria-Hungary and Germany owing partly to the fact that the Danube has hitherto constituted her chief means of communication and partly to the fact that these countries made a more careful study of Bulgarian markets than seemed worth the while of more distant countries. For the first six months of 1920–1, imports, which reached £68,000,000, nearly doubled exports in value. After the treaty, Bulgaria's unfavourable rate of exchange tended to direct her commerce yet more towards Central Europe.

Communications.—Better means of communication and capital are needed to develop the natural resources of the country—forests, mines and water power. Railway construction practically ceased with the outbreak of the first Balkan War in 1912, but the Trans-Balkan Trnovo-Stara Zagora line was completed since that date,

[1] All conversions are made at the pre-war rate of 25 levas to the £; in 1915, 32–35 levas went to the £; in April 1921, about 345–350.
[2] Excluding war expenditure. [3] Budget estimates.

and proved of great importance during the World War for the transport of war material from the Central Powers to Turkey. In 1912, Bulgaria owned about 1,200 m. of normal gauge railway; in 1920 about 1,600 m., including some 250 m. of 2 ft. gauge which had been laid for military purposes. The following are among the railways projected and partly constructed:—

1. Rakovska-Mastanli, part of the line planned in 1913 to connect central Bulgaria with Porto Lagos on the Aegean. Length, about 60 m; gauge 30 in.

2. Sarambe-Lyana-Nevrokop, passing through the pine forests of the Upper Myesta. Length, about 110 m.; gauge, 30 in.

3. Mezdra-Vratsa-Vidin, begun in 1906 and now in operation as far as Alexandrovo, 25 m. from Vidin.

Some 500 m. of link lines and some short lengths of railway for the exploitation of forests are also projected, but work is held up for lack of funds. A law of 1921 sanctioned the construction of railways not only by local bodies but by individuals, and special privileges were offered in the hope of attracting private enterprise. In 1921, Bulgaria owned some 9,900 m. of telegraph line, and some 2 700 m. of telephone line. There were four fixed radio telegraphic stations: Sofia (Telefunken 10 kilowatts) Varna (Marconi). Shumen and Kyustendil, Kyustendil being not yet completed; according to the terms of the treaty, these stations may only be used for commercial purposes.

Social Conditions.—The programme of the Agrarian Government under the leadership of Stamboliiski was framed primarily in the interests of the peasants in contradistinction to those of the *bourgeoisie.* Some of the measures already in operation or contemplated in 1921 evoked much hostile criticism on the part of the Opposition, but though they involved some radical changes there seemed no probability of an outbreak of Bolshevism in Bulgaria. Stamboliiski had no wish to change the constitution, and King Boris had won the respect and affection of the people. The peasants were too much attached to their own homes and to their own way of life to desire great changes, provided they were spared further wars and were given a fair chance of peace and prosperity.

The Bulgars have always put a high value on education, and statistics show a steady increase in the number of those able to read and write; in 1910, Bulgaria ranked first in this respect among Balkan peoples, having 33·7% of literates, and in 1919–20, only 17% of the children of school age had failed to attend school: but the type of education so far provided had led to the overstocking of the clerical professions and to the neglect of technical occupations. The educational programme of the Agrarian Government aimed at giving a more practical bent to instruction generally and at affording equal opportunities to all classes of the community. The total period of compulsory education was to be extended from four to seven years; a large number of additional primary schools had already been opened and many *pro-gymnasia* were to be established, as well as professional schools, where a training could be obtained in agriculture, industries and practical science. Great results, both material and moral, were expected from the law of May 1920 which imposed a period of forced labour on all members of the community. This law, as originally drafted, provided for one year's service for all males on completion of their 20th year and six months for females on completion of their 16th year, the time being devoted half to theoretical training and half to manual labour on works of public utility. Bulgaria's neighbours, however, suspected that a military organization of the country might be effected by means of this compulsory service and, in deference to the Council of Ambassadors, the law had not been fully put in force in the spring of 1921. All classes of the community now give ten days' service annually to the State, and the results of the reconstruction work undertaken—bridge building, road making, repairs to buildings, forestry, etc.—seem satisfactory. Much, of course, depends on the technical supervision provided and on the practical organization of the work. School children, numbering 600,000, and students devoted in March–April 1921 a week to manual labour—cleansing buildings and streets, preparing gardens, planting trees, etc.

Other legislative measures taken include up to May 1921 expropriation of Crown and Church lands as well as of private properties of over 300 *décares* (say 75 ac.), the expropriated land being allotted to landless peasants; the commandeering of private houses for public purposes or for the accommodation of necessitous families; and proceedings by court-martial under Article 4 of the Law for Prosecution of War Criminals, against persons accused of being parties to the entry of Bulgaria into the World War and of contravention of laws during the war. The prosecutions resulted in long terms of imprisonment and heavy fines, and were naturally regarded by those affected who belonged to the *bourgeois* class, as vindictive and arbitrary acts of oppression. The Sobranye assented in March 1921 to the prosecution of Radoslavov and his Cabinet for violation of the constitution, notably by raising a loan in Germany with the object of directing the policy of Bulgaria towards the Central Powers and by declaring war on Serbia in 1916 without the consent of the Sobranye.

BULLARD, ROBERT LEE (1861–), American soldier, was born at Youngsboro, Ala., Jan. 15 1861. He graduated from West Point in 1885 and was appointed first lieutenant in 1891. He served in various capacities in the Spanish-American War, and in the Philippines from 1902 to 1904. He was made lieutenant-colonel in 1906. In 1907 he was special investigator for the U.S. provisional Government in Cuba, and the following year was superintendent of public instruction there. In 1911 he was promoted colonel, and in 1917 brigadier-general. He commanded the Second Brigade of the 1st Division of the A.E.F. in France in 1917 and was made major-general N.A. From the middle of Dec. 1917 to the middle of July following he commanded the 1st Division and from Oct. 1918 to the following July the Second Army. In Nov. 1918 he was appointed major-general in the regular army.

BULLEN, ARTHUR HENRY (1857–1920), British man of letters, was born in London Feb. 9 1857 and educated at the City of London school and Balliol College, Oxford. He was the son of George Bullen, sometime keeper of the Printed Books at the British Museum. In earlier life he was a schoolmaster, but subsequently devoted himself to literary work. He became known as an authority on Elizabethan literature, and particularly for his discoveries of long-lost lyrics in the Bodleian and Christ Church libraries at Oxford, and his rediscovery of Campion in 1889 after nearly 300 years of neglect (*see* 5.138). For several years he was a partner in the publishing house of Lawrence & Bullen, and after its dissolution founded the Shakespeare Head press at Stratford-on-Avon in 1904, which he conducted until his death, but which was afterwards sold to B. H. Blackwell of Oxford. He died at Stratford-on-Avon Feb. 29 1920.

BULLEN, FRANK THOMAS (1857–1915), British novelist, was born in London April 5 1857 and was educated for a few years only at a dame school and Westbourne school, Paddington. When he was nine years old his school life came to an end, and he was employed as an errand boy for a time. In 1869 he went to sea, serving before the mast, and travelled to all parts of the world in various capacities including that of chief mate. In 1883 he gave up this seafaring life and became a clerk in the Meteorological Office until 1889. His reputation was made over the publication of *The Cruise of the "Cachelot"* (1906); and he also wrote, amongst other books, *Idylls of the Sea* (1899); *Sea Wrack* (1903); *The Call of the Deep* (1907) and *A Compleat Sea Cook* (1912), besides many articles and essays. He died at Madeira March 1 1915.

BÜLOW, BERNHARD HEINRICH KARL MARTIN, PRINCE VON (*see* 4.793).—Prince Bülow, after his resignation of the German chancellorship in 1909, lived principally at the villa in Rome which he had purchased with a view to his retirement.

Part of the summer he usually spent at Flottbeck near Hamburg or on the island of Norderney. A large fortune left him by a cousin, a Hamburg merchant, enabled him to live in elegant leisure and to make his house in Rome a centre of literary and political society. He employed his leisure in writing for the centenary celebrations of the Wars of Liberation, a remarkable book on Imperial Germany, extolling its achievements and defending the main lines of his own foreign policy (Engl. translation, M. Lavenz, 1914). In a revised edition (Engl. translation 1916) he omitted or altered many passages which seemed compromising in the light of the World War, *e.g.* his exposition of his policy of lulling Great Britain into a sense of security, while the great German navy was being constructed. He was understood to be in deep disfavour with William II., who never forgave him his attitude and action with regard to the *Daily Telegraph* interview in 1908.

On the outbreak of war Bülow found opportunity to identify himself publicly with the German cause, and, from his own point of view, he doubtless felt what, after Germany's collapse, was made a ground of bitter reproach to him, that no one had been more actively identified than he with the main lines of the German policy which led up to the war.

He was once more to be employed in the service of his country, this time on a desperate enterprise. Italy, which had declared her neutrality at the outbreak of the war, did not eventually confine herself to the declaration that the *casus foederis* had not arisen for her as a member of the Triple Alliance. She had already intimated (July 5 1914) through diplomatic channels that she considered the action of Austria-Hungary against Serbia to be aggressive and provocative. On Dec. 9 1914 Baron Sonnino addressed a note to the Austro-Hungarian Minister for Foreign Affairs, Count Berchtold, calling attention to Art. VII. of the treaty by which Italy participated in the Triple Alliance, with particular reference to the words in that clause according to which the Austro-Hungarian Government was bound, in the event of its disturbing the *status quo* in the Balkans even by a temporary occupation of Serbian territory, to come to an agreement with Italy and to arrange for compensations. By this note the questions of the Trentino and Trieste were formally opened. Austria-Hungary manifested great reluctance to enter upon the question of compensations, but Berlin was more alert and more anxiously concerned. Prince Bülow was, therefore, entrusted with the temporary charge of the German embassy in Rome, the actual ambassador, Herr von Flotow, going on sick-leave (Dec. 19 1914). He at once plunged into active negotiations, and began by expressing his entire sympathy on principle with the Italian demand for compensations. He had, however, to fight the intransigeance of the Hungarian prime minister, Tisza, and Tisza's nominee, who was Berchtold's successor, Baron Burian. Bülow was from the first for the complete cession of the Trentino to Italy, but Austria-Hungary was willing to cede only part of it. Sonnino, for his part, pointed out that Italian feeling would not be satisfied even with the whole of the Trentino, but would also, in accordance with the irredentist programme, demand Trieste. Bülow continued to urge that all he could mediate for was the Trentino but that Austria would fight to keep Trieste. Early in April 1915 Italy put forward in the course of the negotiations, which were secret, her demands for the Trentino, Trieste, the Cuzolari Is., off the Dalmatian coast, the recognition by Austria-Hungary of Italian sovereignty over Vallona, etc. The negotiations dragged on till the middle of May, when Bülow made a grave but characteristic tactical mistake. He is understood to have induced the Italian ex-premier Giolitti to come to Rome from Turin in the hope that Giolitti's following in the Chamber would be powerful enough to prevent a rupture and to bring about the acceptance of the Austro-Hungarian terms. An equally characteristic propaganda was believed to have been instituted by Bülow, in conjunction with the Austro-Hungarian ambassador Macchio, among the partisans of Giolitti behind the back of the Italian Government. The prime minister, Salandra, suddenly resigned. There was a great outburst of popular indignation, fanned by the impassioned eloquence of d'Annunzio and finding expression in demonstrations in front of the Quirinal (the royal palace) and on the Capitol, the municipal centre of Rome. After a great majority in the Italian Parliament had on May 20 expressed confidence in Salandra, general mobilization was ordered on May 22, and the formal declaration of war against Austria-Hungary followed on May 23 1915. On May 24 Bülow left Rome.

During the war he lived in Berlin, and although since the peace he has again resided in Rome for part of every year, he spends many months in Germany. His name was mentioned in a ministerial crisis of 1921 as a possible chancellor, but he was entirely inacceptable to the vast majority of the German people and of the Reichstag. (G. S.)

BÜLOW, KARL VON (1846–1921), German field-marshal, was born in Berlin March 24 1846 and joined the 2nd Guards regiment of infantry in 1864. He gained distinction at Königgrätz in the war of 1866, served through the Franco-Prussian War of 1870, winning the Iron Cross (2nd class), and, after holding various staff appointments, became colonel of the 4th Guards regiment in 1894. Three years later he was promoted major-general and was transferred to the War Office. In 1900 he was promoted lieutenant-general and in 1901 was general commanding the Guards division. In 1912 he attained the rank of *generaloberst* and was entrusted with the III. Army Inspection. He was thus marked out for high command, and on the outbreak of the World War he was placed in charge of the II. Army, which invaded Belgium. He occupied Liége (Aug. 7) and advanced to the Marne. He commanded the I. and VII. Armies during the retreat and at the battles of the Aisne, thus incurring responsibility in the eyes of the public for the failure to take Paris. In Jan. 1915 he was promoted field-marshal and in June 1916 was, by his own wish, placed on the retired list. He died in Berlin Aug. 31 1921.

BUNTING, SIR PERCY WILLIAM (1836–1911), British journalist, was born at Manchester Feb. 1 1836 and was educated at Owen's College, Manchester, and Pembroke College, Cambridge. In 1859 he was classed as 21st wrangler, and three years later was called to the bar at Lincoln's Inn. In 1882 he became editor of the *Contemporary Review*, and henceforth devoted himself to journalism, becoming also editor of the *Methodist Times* from 1902 to 1907 in succession to Hugh Price Hughes In 1908 he was knighted. Throughout his life he was an active supporter of Wesleyan Methodism, being the grandson of Jabez Bunting, a distinguished Wesleyan divine (*see* 4.802). He died in London July 22 1911.

BURBIDGE, SIR RICHARD, 1st Bart. (1847–1917), English merchant, was born in Wiltshire March 2 1847. He was educated at Devizes and Melksham and at the age of 13 was apprenticed to a provision merchant in Oxford St., London, afterwards starting in business as a provision merchant at the age of 19. Fourteen years later he became general superintendent of the Army and Navy Auxiliary Stores. In 1882 he was appointed general manager of Whiteley's, Westbourne Grove, and in 1891 entered the service of Harrods, Brompton Road, of which he was afterwards managing director. By 1916 he had increased its profits from £16,000 to over £200,000, and it had become one of the largest of the London stores. He had also done a good deal to ensure shorter working hours for shop assistants. Mr. Burbidge was the "private citizen" who anonymously presented about £30,000 to the fund for acquiring the Crystal Palace for the public in 1913. During the World War he was responsible for the building and fitting up of two hospitals in Belgium and was a member of many Government committees, including the advisory committee of the Ministry of Munitions and the committee of inquiry into the Royal Aircraft workings, of which he was chairman. He was created a baronet in 1916. He died in London May 31 1917, being succeeded as second baronet by his son R. Woodman Burbidge (b. 1872), who in 1921 became chairman of Harrods.

See Mrs. Stuart Menzies, *Modern Men of Mark* (1920).

and proved of great importance during the World War for the transport of war material from the Central Powers to Turkey. In 1912, Bulgaria owned about 1,200 m. of normal gauge railway; in 1920 about 1,600 m., including some 250 m. of 2 ft. gauge which had been laid for military purposes. The following are among the railways projected and partly constructed:—

1. Rakovska-Mastanli, part of the line planned in 1913 to connect central Bulgaria with Porto Lagos on the Aegean. Length, about 60 m.; gauge 30 in.

2. Sarambe-Lyana-Nevrokop, passing through the pine forests of the Upper Myesta. Length, about 110 m.; gauge, 30 in.

3. Mezdra-Vratsa-Vidin, begun in 1906 and now in operation as far as Alexandrovo, 25 m. from Vidin.

Some 500 m. of link lines and some short lengths of railway for the exploitation of forests are also projected, but work is held up for lack of funds. A law of 1921 sanctioned the construction of railways not only by local bodies but by individuals, and special privileges were offered in the hope of attracting private enterprise. In 1921, Bulgaria owned some 9,900 m. of telegraph line, and some 2 700 m. of telephone line. There were four fixed radio telegraphic stations: Sofia (Telefunken 10 kilowatts) Varna (Marconi). Shumen and Kyustendil, Kyustendil being not yet completed; according to the terms of the treaty, these stations may only be used for commercial purposes.

Social Conditions.—The programme of the Agrarian Government under the leadership of Stamboliiski was framed primarily in the interests of the peasants in contradistinction to those of the *bourgeoisie*. Some of the measures already in operation or contemplated in 1921 evoked much hostile criticism on the part of the Opposition, but though they involved some radical changes there seemed no probability of an outbreak of Bolshevism in Bulgaria. Stamboliiski had no wish to change the constitution, and King Boris had won the respect and affection of the people. The peasants were too much attached to their own homes and to their own way of life to desire great changes, provided they were spared further wars and were given a fair chance of peace and prosperity.

The Bulgars have always put a high value on education, and statistics show a steady increase in the number of those able to read and write; in 1910, Bulgaria ranked first in this respect among Balkan peoples, having 33·7 % of literates, and in 1919–20, only 17 % of the children of school age had failed to attend school: but the type of education so far provided had led to the overstocking of the clerical professions and to the neglect of technical occupations. The educational programme of the Agrarian Government aimed at giving a more practical bent to instruction generally and at affording equal opportunities to all classes of the community. The total period of compulsory education was to be extended from four to seven years; a large number of additional primary schools had already been opened and many *pro-gymnasia* were to be established, as well as professional schools, where a training could be obtained in agriculture, industries and practical science. Great results, both material and moral, were expected from the law of May 1920 which imposed a period of forced labour on all members of the community. This law, as originally drafted, provided for one year's service for all males on completion of their 20th year and six months for females on completion of their 16th year, the time being devoted half to theoretical training and half to manual labour on works of public utility. Bulgaria's neighbours, however, suspected that a military organization of the country might be effected by means of this compulsory service and, in deference to the Council of Ambassadors, the law had not been fully put in force in the spring of 1921. All classes of the community now give ten days' service annually to the State, and the results of the reconstruction work undertaken—bridge building, road making, repairs to buildings, forestry, etc.—seem satisfactory. Much, of course, depends on the technical supervision provided and on the practical organization of the work. School children, numbering 600,000, and students devoted in March–April 1921 a week to manual labour—cleansing buildings and streets, preparing gardens, planting trees, etc.

Other legislative measures taken include up to May 1921 expropriation of Crown and Church lands as well as of private properties of over 300 *décares* (say 75 ac.), the expropriated land being allotted to landless peasants; the commandeering of private houses for public purposes or for the accommodation of necessitous families; and proceedings by court-martial under Article 4 of the Law for Prosecution of War Criminals, against persons accused of being parties to the entry of Bulgaria into the World War and of contravention of laws during the war. The prosecutions resulted in long terms of imprisonment and heavy fines, and were naturally regarded by those affected who belonged to the *bourgeois* class, as vindictive and arbitrary acts of oppression. The Sobranye assented in March 1921 to the prosecution of Radoslavov and his Cabinet for violation of the constitution, notably by raising a loan in Germany with the object of directing the policy of Bulgaria towards the Central Powers and by declaring war on Serbia in 1916 without the consent of the Sobranye.

BULLARD, ROBERT LEE (1861–), American soldier, was born at Youngsboro, Ala., Jan. 15 1861. He graduated from West Point in 1885 and was appointed first lieutenant in 1892. He served in various capacities in the Spanish-American War, and in the Philippines from 1902 to 1904. He was made lieutenant-colonel in 1906. In 1907 he was special investigator for the U.S. provisional Government in Cuba, and the following year was superintendent of public instruction there. In 1911 he was promoted colonel, and in 1917 brigadier-general. He commanded the Second Brigade of the 1st Division of the A.E.F. in France in 1917 and was made major-general N.A. From the middle of Dec. 1917 to the middle of July following he commanded the 1st Division and from Oct. 1918 to the following July the Second Army. In Nov. 1918 he was appointed major-general in the regular army.

BULLEN, ARTHUR HENRY (1857–1920), British man of letters, was born in London Feb. 9 1857 and educated at the City of London school and Balliol College, Oxford. He was the son of George Bullen, sometime keeper of the Printed Books at the British Museum. In earlier life he was a schoolmaster, but subsequently devoted himself to literary work. He became known as an authority on Elizabethan literature, and particularly for his discoveries of long-lost lyrics in the Bodleian and Christ Church libraries at Oxford, and his rediscovery of Campion in 1889 after nearly 300 years of neglect (*see* 5.138). For several years he was a partner in the publishing house of Lawrence & Bullen, and after its dissolution founded the Shakespeare Head press at Stratford-on-Avon in 1904, which he conducted until his death, but which was afterwards sold to B. H. Blackwell of Oxford. He died at Stratford-on-Avon Feb. 29 1920.

BULLEN, FRANK THOMAS (1857–1915), British novelist, was born in London April 5 1857 and was educated for a few years only at a dame school and Westbourne school, Paddington. When he was nine years old his school life came to an end, and he was employed as an errand boy for a time. In 1869 he went to sea, serving before the mast, and travelled to all parts of the world in various capacities including that of chief mate. In 1883 he gave up this seafaring life and became a clerk in the Meteorological Office until 1889. His reputation was made over the publication of *The Cruise of the "Cachelot"* (1906); and he also wrote, amongst other books, *Idylls of the Sea* (1899); *Sea Wrack* (1903); *The Call of the Deep* (1907) and *A Compleat Sea Cook* (1912), besides many articles and essays. He died at Madeira March 1 1915.

BÜLOW, BERNHARD HEINRICH KARL MARTIN, PRINCE VON (*see* 4.793).—Prince Bülow, after his resignation of the German chancellorship in 1909, lived principally at the villa in Rome which he had purchased with a view to his retirement.

in 1915, an order barring unneutral envelopes and cards from the mails, and after America became a belligerent he instituted a censorship designed to suppress treasonable and seditious newspapers. The purpose was reasonable, but it was impossible to draw an ideal line and the result was a general alienation of the press. Later he introduced the "zone system," whereby postage on second-class mail was charged according to distance. In Aug. 1918 the telephone and telegraph systems were taken over temporarily by the Government and their control vested in the postmaster-general. He was an avowed advocate of permanent Government ownership of the telegraph and telephone, and in Dec. 1918 urged legislation to that end. In Nov. 1918, five days after the Armistice was signed, he took over the cables. He aroused the hostility of labour by his opposition to organization and strikes among postal employees. As early as 1913 he had urged repeal of the law allowing them to organize. He was interested in extending the parcel post, and worked for the promotion of aerial mail service.

BURNAND, SIR FRANCIS COWLEY (1836–1917), English humorist (*see* 4.848), died at Ramsgate April 21 1917.

BURNET, SIR JOHN JAMES (1859–), Scottish architect, whose father was an architect in Glasgow, was born in that city in 1859, and was educated at the Western Academy, entering the École des Beaux-Arts, Paris, in 1874. He passed three years in the studio of Pascal, whose direction and guidance had a strong influence on his future design. After his return to Glasgow Burnet's first important commission was the Royal Institute of Fine Arts, the beginning of a series of important public buildings in various places in Scotland. Amongst these are the offices for the Clyde Navigation Trust, the Glasgow Athenaeum, the Pathological Institute—an extension of the Glasgow Infirmary—and the lay-out and building for the International Exhibition at Edinburgh, in 1886. He carried out also much ecclesiastical work, notably the Barony church at Glasgow and churches at Arbroath, Brechin and Larbert. Amongst the larger business buildings designed by Burnet are the head office of the Union Bank of Scotland, and in London the important completion of the Selfridge premises, in collaboration with J. E. Graham, of Chicago. Entrusted with the addition of the new galleries at the back of the British Museum, a work which eventually took him upwards of nine years, Burnet, with a view of informing himself as to the conditions of museum design elsewhere, visited in 1895 various European galleries—Paris, Berlin, Vienna and others. In the following year he visited the United States, in order to obtain information for his designs for new laboratories for Glasgow University. He was knighted in 1914, and among his other honours were the LL.D. degree at Glasgow, and membership of the Institut de France, the Société Central des Architectes Français, and the American Institute of Architects.

BURNETT, FRANCES ELIZA HODGSON (1849–), American writer (*see* 4.853), published in 1911 *The Little Princess, a Play for Children and Grown-Up Children, in Three Acts.* Her other later writings include *My Robin* (1912); *T. Tembarom* (1913); *A Lady of Quality* (1913); *The Lost Prince* (1915); *The One I Know the Best of All* (1915); *The Little Hunchback Zia* (1916); *The Way to the House of Santa Claus* (1916), and *The White People* (1917).

BURNHAM, EDWARD LEVY LAWSON, 1ST BARON (1833–1916), English newspaper proprietor, was born in London Dec. 28 1833. His father, Joseph Moses Levy (d. 1888) who married Esther Cohen, was managing proprietor of a paper manufacturing and printing company and proprietor of the *Sunday Times*. Edward Levy, who took the added surname of Lawson in 1875 in accordance with the will of an uncle, Lionel Lawson, was educated at University College school, London. On leaving school he entered his father's business, and there received a thorough training in the printing and paper trades. In June 1855, immediately after the stamp duty on newspapers had been removed, the *Daily Telegraph and Courier* (*see* 19.559) was started by Colonel Sleigh. In September it was acquired by Mr. J. M. Levy, in liquidation of the debt due to him for paper and printing. Edward Levy, who was already dramatic critic of the *Sunday Times*, now became editor of the *Daily Telegraph*, and 30 years later its managing proprietor and sole director. It was not until 1903 that he relinquished this position to his eldest son. He took a leading place in English journalism, and was largely instrumental in getting the paper duty abolished in 1861. He was more than once president of the Institute of Journalists, and was active in his support of press charities, especially as trustee and treasurer to the Newspaper Press Fund. In 1909 he presided over the first Imperial Press conference, held in London; in 1920 his son similarly presided at the conference held in Canada. On Lord Burnham's 80th birthday he was the recipient of an address signed by the leading journalists of the British Empire, the United States and many European countries, expressing their sense of his great services to journalism. He was created a baronet in 1892 and was raised to the peerage as Baron Burnham in 1903. He married Harriette Georgiana (d. 1897), daughter of the actor Benjamin Webster (*see* 28.459). He died in London Jan. 9 1916.

His eldest son, HARRY LAWSON WEBSTER LAWSON, 1st Viscount Burnham (1862–), was born in London Dec. 18 1862, and was educated at Eton and Balliol College, Oxford. He represented W. St. Pancras in the House of Commons from 1885 to 1892, E. Gloucestershire from 1893–5, and Tower Hamlets from 1905–6, and again from 1910–6. He was also a member of the London County Council from 1889–92 and from 1897 to 1904, as well as mayor of Stepney 1908–9. He succeeded to his father's barony in 1916, and was created a viscount in 1919. In his position as editor and managing proprietor of the *Daily Telegraph* he did valuable work during the World War. In 1917 he was included in the first gazette of the new Order of Companions of Honour. He was hon. colonel of the Royal Bucks Hussars. He married in 1884 Olive, daughter of Gen. Sir Henry de Bathe, Bart., but had no son. The heir to the barony in 1921 was, therefore, his brother, Col. William Arnold Webster Lawson (b. 1864).

BURNHAM, DANIEL HUDSON (1846–1912), American architect, was born at Henderson, N.Y., Sept. 4 1846. At the age of ten he moved to Chicago, and was educated there and at Waltham, Mass. He worked as an architect in various offices in Chicago, and in 1871 formed a partnership with John W. Root. To them was entrusted the planning of the Chicago World's Fair (1893). On the death of Root this work fell wholly upon Burnham, who in 1891 formed with C. B. Atwood a partnership known as D. H. Burnham & Co. In 1894 he was elected president of the American Institute of Architects. His success with the Chicago World's Fair buildings soon led to his being called upon to design structures in many cities. Of these may be mentioned "The Rookery," the Great Northern hotel, the Masonic Temple, and the Railway Exchange, in Chicago; the "Flatiron Building," and new Wanamaker's store, in New York; the Pennsylvania railway station in Pittsburgh; Filene's store in Boston; the Union station in Washington and Selfridge's in London. He also was asked to propose plans for improving several cities, including Cleveland (1903), San Francisco (1905, after the earthquake), Chicago (1909), and Baltimore. In 1905 he was asked by the U.S. Government to design plans for cities in the Philippines, including Manila. He was made chairman of the national committee appointed for beautifying Washington, D.C. He died in Heidelberg, Germany, June 1 1912.

BURNS, JOHN (1858–), English politician (*see* 4.855), held the office of President of the Local Government Board for more than eight years, during which he underwent comparatively little hostile criticism save from his old friends of the Labour party. While resisting a policy of doles, he was zealous in forwarding substantial measures of social reform; but he did not take a prominent part in the great party disputes over the budget of 1909 and the Parliament bill. His activity and success in the administration of his department were recognized—much against his own wish—by the raising of the President's salary in 1910 from £2,000 to £5,000 a year; but his policy was thought

to be too conservative even by some members of the Unionist party, and early in 1914 he was promoted to the Presidency of the Board of Trade. He held this office only six months, as in the following Aug. he could not bring himself to accept the necessity of war. He resigned without making any public statement of his reasons, and took no further active part in Parliament. At the general election of 1918 he desired to stand again for Battersea; but the local labour men required him, as a condition of their support, to become a member of the Labour party, sign its constitution, and accept its programme and whips. He refused to comply. "I do not believe," he wrote, "in political indentured labour. A war against militarism must not end in conscript members of Parliament." Accordingly he withdrew his candidature, and continued in private life.

BURNS AND SCALDS (*see* 4.860).—During the World War a large number of burns were encountered in British medical practice, in the army and the navy and in munition works. The ordinary methods of treatment were adopted, but in addition the use of hot paraffin applications was tried with very marked success. This treatment indeed is stated by its supporters to give better results than any other hitherto employed. The burn is first of all washed with normal saline or with an antiseptic such as flavine or proflavine (1–1,000): it is then dried with gauze or an electric dryer. A layer of paraffin is applied at temperature 55°–60°C. A thin layer of wool is placed over the first layer of paraffin and then a second layer of hot paraffin painted over the wool. A dressing of wool and bandage is then applied and this is changed every 24 hours. The layer of paraffin must be of sufficient thickness. It may be sprayed on instead of painted. The temperature is thus important, for if it is too high the paraffin will run.

The effect of the paraffin is largely to act as a protection, and it is claimed by some that the addition of antiseptics to the paraffin is very advantageous. Lieut.-Col. A. J. Hull of the R.A.M.C. emphasized this in a communication to the journal of the Corps and recommended that the aniline antiseptics, brilliant green or flavine, should be employed. These antiseptics owe their wide use to the work of Professor C. H. Browning, who first introduced them.

The preparation of the paraffin is thus described by Colonel Hull:—

"Take ½ gramme of brilliant green or 2 grammes of scarlet red or flavine and 40 grammes of lanoline, rub up the coloured material with the *adeps lanae hydrosus* until a highly coloured smooth paste is obtained which contains no undisintegrated particles of the dye; using about ½ oz. of water assists the solution of the dyes. Melt the paraffin durum (678 grammes) and add 210 grammes of paraffin molle and 50 c.c. of olive oil. Let the temperature of the resulting mixture sink to at least 65° C.; then stir in the previously prepared lanoline paste, stirring until thoroughly mixed. At about 55° C. add 20 c.c. of eucalyptus oil; stir and allow to solidify."

The scarlet is said to form the least satisfactory suspension, but its therapeutic value has caused it to be continued in use. It acts as a stimulus to healing after the burns are clean. The flavine paraffin seems to answer best for recent burns. (R. M. Wi.)

BURROUGHS, JOHN (1837–1921), American naturalist and writer (*see* 4.863), continued to instruct and entertain a wide public with frequent essays on out-of-door life, some of which were assembled in the following volumes: *Time and Change* (1912); *The Summit of the Years* (1913); *The Breath of Life* (1915); *Under the Apple Trees* (1916), and *Field and Study* (1919). Yale conferred upon him the degree of Litt.D. (1910), and Colgate the degree of L.H.D. (1911). He died on a train near Kingsville, O., March 29 1921, while returning from California to his country home in New York state.

BURROWS, RONALD MONTAGU (1867–1920), English classical scholar and archaeologist, was born at Rugby Aug. 16 1867 and educated at Charterhouse and Christ Church, Oxford. From 1891 to 1898 he was assistant to Mr. Gilbert Murray, then professor of Greek at Glasgow, and from 1898 to 1908 he was professor of Greek at University College, Cardiff. In 1908 he was transferred to the corresponding chair at the Victoria University of Manchester. He conducted excavations at Pylos and Sphacteria in 1895–6, and at Rhitsona in Boeotia in 1907. In 1913 he became principal of King's College, London, and held that post till his death in London May 14 1920. He published *Recent Discoveries in Crete* (1907) and various papers on archaeological subjects. All his life he was a fervent Philhellene. During the World War he was in active coöperation with the efforts of M. Venizelos to protect the interests of Greece and to secure Greek adherence to the Allies, and he took a leading part, by lectures and articles, in making the problems of the Near East familiar to the public.

BURT, THOMAS (1837–), British Labour politician, was born at Murton Row, near North Shields, Northumberland, Nov. 12 1837. He was the son of a miner, and himself started working in the pits when ten years of age, his education being scanty. In 1865 he was elected secretary of the Northumberland Miners' Mutual Provident Association, a post which he held until 1913, and in 1874 successfully contested Morpeth in the Labour interest, being thus (along with Alexander Macdonald) the first of the Labour members in the House of Commons. He took part in many industrial conferences, and in 1890 was one of the British representatives at the Berlin Labour congress of that year. In 1891 he was president of the trade union congress at Newcastle, and in 1892 entered the Liberal ministry as parliamentary secretary of the Board of Trade, holding this post until 1895. In 1906 he was created a privy councillor, and in 1918 resigned his seat in Parliament.

See A. Watson, *A Great Labour Leader* (1908).

BUTCHER, SAMUEL HENRY (1850–1910), English classical scholar, was the eldest son of Samuel Butcher, classical tutor and lecturer at Trinity College, Dublin, and subsequently Bishop of Meath. Born in Dublin April 16 1850, he went to Marlborough in 1864 and won an open scholarship for classics at Trinity College, Cambridge, in 1860. In 1870 he won the Bell scholarship at Cambridge, in 1871 the Waddington scholarship, and in 1871 and 1872 the Powis medal. In 1873 he graduated as senior classic and won a Chancellor's medal. He took an assistant mastership at Eton for a year, but returned to Trinity, Cambridge, as fellow and lecturer in classics. On his marriage in 1876 to Rose, daughter of Archbishop Trench of Dublin, he had to resign his Trinity fellowship, and was then elected tutor and "married fellow" at University College, Oxford. In 1882 he succeeded Professor Blackie as professor of Greek in the university of Edinburgh. During his tenure of this chair he became widely known, not only as a scholar, but as a judicious administrator and educational reformer. He was a member of the royal commission which was appointed after the passing of the Scottish Universities bill in 1889 to reform the whole academical system in Scotland, and which reported in April 1900. In 1902 Mrs. Butcher died, and two years later he resigned his professorship and went to reside in London. He had been a member of the royal commission of 1901 on University Education in Ireland, which produced an abortive report with eight reservations in 1903; and he was also included on the royal commission of 1906. In the latter year, on the death of Sir Richard Jebb, he was chosen as a Unionist to represent the university of Cambridge in Parliament, where his brother J. G. Butcher (b. 1853; created a baronet in 1918), a well-known barrister, had sat for many years as Unionist member for York; he made an effective maiden speech on the Irish University bill and frequently took a valuable part in debate. His grave and thoughtful style and gift of natural eloquence were combined with a charm and sincerity which won him universal respect and affection, no less in public than in private life. He was however, above all, a fine Greek scholar, full of the true spirit of classical learning, with a remarkable power of literary expression, shown especially in such publications as *Some Aspects of the Greek Genius* (1891); *Aristotle's Theory of Poetry and Fine Art* (1895); *Greek Idealism in the Common Things of Life* (1901); *Harvard Lectures on Greek Subjects* (1904) and his prose translation (with Andrew Lang) of the *Odyssey* (1879). In 1907 he was president of the English Classical Association, of which he had been one of the principal founders in 1903. He was also the first president of the Irish Classical

Association, and an original member of the British Academy, becoming its president in 1909. In 1908 he was appointed a trustee of the British Museum. Two years later his health began to fail, and he delivered his last speech on Oct. 21 1910, at the dinner given to celebrate the publication of the 11th edition of the *E.B.* by the Cambridge University Press. He died in London Dec. 2 1910.

BUTLER, HENRY MONTAGU (1833–1918), English educationist (*see* 4.882), as master of Trinity, Cambridge, displayed to the full the scholastic and administrative gifts which had distinguished his period as headmaster of Harrow. His best-known work is a volume entitled *Sermons Historical and Biographical* (1890), but in 1914 he published *Some Leisure Hours of a Long Life*, which contained excellent classical verse. He died at Cambridge Jan. 14 1918.

See Edward Graham, *The Harrow Life of H. M. Butler* (1920).

BUTLER, NICHOLAS MURRAY (1862–), American educator (*see* 4.885), was elected a member of the American Academy of Arts and Letters in 1911. In 1912 he was chairman of the New York State Republican Convention and also a delegate to the Republican National Convention. Vice-President Sherman was renominated but died shortly before the general election, and the Republican electoral votes were cast for Dr. Butler for vice-president, who was overwhelmingly defeated on the ticket with President Taft. On the outbreak of the World War he supported the administration's peace policy as responding "to the best wishes and hopes of the whole people." He criticised the formation of the National Security League on the ground that, in some cases at least, it had business interests back of it; and he disapproved of the organization of the American Legion. In 1916, however, he urged America's entrance into the war. The same year he was again a delegate to the Republican National Convention, serving as chairman of the Committee on Resolutions. He favoured woman suffrage and was an advocate of the short ballot. At the Republican National Convention in 1920 he received 69 votes for the presidential nomination on the first ballot, the number gradually falling to two on the tenth and last ballot. As an educator President Butler was a bold critic of many contemporary tendencies in American education. He upheld the old theory of mental discipline, and in the face of the wide-spread vocational movement in schools and colleges remained a steadfast and eloquent defender of liberal education. Under his guidance Columbia University became a cosmopolitan institution, its total registration in 1920 approximating 30,000 (*see* COLUMBIA UNIVERSITY). He was chairman of the National Committee of the United States for the Restoration of the university of Louvain, destroyed by the Germans in 1914. In 1920 he resigned the editorship of *The Educational Review*, becoming advisory editor. He was the author of *Questions of American Freedom* (1911); *Why Should We Change Our Form of Government?* (1912); *Progress in Politics* (1913); *The Meaning of Education* (1915, enlargement of the work published in 1898); *A World in Ferment* (1917, interpretations of the war for a new world); *Is The World Worth Saving?* (1920); *Scholarship and Service* (1921).

BUTLER, SIR WILLIAM FRANCIS (1838–1910), English soldier and author (*see* 4.888), died in Tipperary June 7 1910.

BUTT, CLARA (1873–), English contralto singer, was born at Southwick, Sussex, Feb. 1 1873. She received her musical training at the Royal College of Music, and made her début in a students' performance of Gluck's *Orfeo* at the Lyceum theatre, London, in 1892. She possessed a contralto voice of exceptional power and wide range, and from the first became a public favourite as a ballad and oratorio singer. In 1900 she married the singer Kennerley Rumford (b. 1870), and with him sang constantly at concerts in all parts of Great Britain, also undertaking various long tours in the colonies. During the World War she devoted the proceeds of many of her concerts to war charities, and was in 1917 created D.B.E.

BUXTON, SYDNEY CHARLES BUXTON, 1ST VISCOUNT (1853–), British politician and administrator, was born in London Oct. 25 1853, the grandson of Sir Thomas Fowell Buxton, 1st Bart. He was educated at Clifton and Trinity College, Cambridge, and afterwards entered public life, becoming a member of the London School Board in 1876. He was Liberal M.P. for Peterborough from 1883 to 1885, and for Poplar from 1886 till 1914. From 1892 to 1895 he was Under-Secretary for the Colonies. From 1905 to 1910 he was Postmaster-General, and from 1910 to 1914 President of the Board of Trade. In 1914 he was appointed High Commissioner and Governor-General of South Africa, being raised to the peerage as Viscount Buxton. He retired from this office in 1920.

Lord Buxton published *Handbook to Political Questions* (1880); *Finance and Politics: An Historical Study (1783–1885)* (1888); *Handbook to the Death Duties* (with G. S. Barnes, 1890); *Political Manual* (4th ed. 1891); *Mr. Gladstone as Chancellor of the Exchequer* (1901); *The Fiscal Question* (1904).

BYNG, JULIAN HEDWORTH GEORGE BYNG, 1ST BARON (1862–), British general, was born Sept. 11 1862, son of the 2nd Earl of Strafford, and joined the 10th Hussars in India in 1883. He saw his first active service on the Red Sea littoral a year later, when his regiment disembarked there on their way home. He passed through the Staff College, and was a major when the South African War broke out; he was then sent on special service to the Cape. He raised and commanded the South African Light Horse, which formed part of the Natal army and was at the relief of Ladysmith. Subsequently he commanded a column with marked success and was rewarded with promotion to the ranks of brevet lieutenant-colonel and colonel. After the war he commanded his regiment for two years, was then for a year in charge of the cavalry school, and was at the head of a cavalry brigade from 1907–9, when he was promoted major-general. He spent two years in charge of a Territorial division and then, in 1912, he was sent to Egypt to take command of the army of occupation.

In Oct. 1914 he was summoned home to take the 3rd Cavalry Div. to France, and he succeeded to the command of the Cavalry Corps in June 1915. But two months later he was despatched to the Dardanelles to take charge of the IX. Army Corps there and he became responsible for the Suvla area, from which he withdrew his troops most skilfully in the following December. For this valuable service he received the K.C.M.G., his corps proceeding to Egypt; but he was almost immediately called back to the western front to take over the XVII. Army Corps, and in May 1916 he was transferred from this to the Canadian Army Corps, then formed, which he commanded for a year. The Dominion troops under his orders distinguished themselves on several occasions, especially in their capture of Vimy Ridge on April 9 1917. He had been promoted lieutenant-general for distinguished service in 1916 and was given the K.C.B.

In June 1917 he succeeded to the leadership of the III. Army, which he retained till the close of hostilities. Towards the end of Nov. he carried out the brilliantly successful surprise attack on the Cambrai front for which he was promoted full general, though the German counterstroke in Dec. largely regained the lost ground. Remaining on this front in the winter of 1917–8, his forces were on the left of the V. Army in the battles of March 1918 and were to some extent involved in its defeat, but they remained unbroken and eventually it was on their front that the enemy's attack first came to a definite standstill. Five months later they bore their full share in breaking the Hindenburg line and in the general advance. For his services Byng was raised to the peerage as Baron Byng of Vimy and Stoke-le-Thorpe, and he received a grant of £30,000. He retired from the army in 1919, and in June 1921 was appointed to succeed the Duke of Devonshire as governor-general of Canada.

BYWATER, INGRAM (1840–1914), English classical scholar (*see* 4.906), died in London Dec. 17 1914. He was a great collector of books, especially early printed Greek books, and he left a bequest to provide for the study of Byzantine Greek at Oxford.

See W. W. Jackson, *Memoir of Ingram Bywater* (1919).

CABLE, SUBMARINE TELEGRAPH: *see* SUBMARINE CABLE TELEGRAPHY.

CADBURY, GEORGE (1839–), British manufacturer and philanthropist, was horn Sept. 19 1839 at Edgbaston, Birmingham, the son of Quaker parents, and was hrought up a member of that Society. In 1861 when he succeeded to the cocoa business known later as Cadbury Brothers Ltd., it gave employment to 12 workers only, but under the management of himself and his brother Richard it developed rapidly, and in 1879 he founded for the employees the garden village of Bournville, which served as a model for other social ventures of the kind. In 1919 when Cadbury Brothers Ltd. amalgamated with the firm J. S. Fry & Son of Bristol, they employed in all 4,000 people. Mr. Cadbury became chief proprietor of the *Daily News* in 1901, and his family also acquired an interest in the *Star* in 1909. The connexion of the Cadburys and other Quaker families with these Liberal and Free Trade organs caused them to be dubbed by opponents the "cocoa press."

His second wife, ELIZABETH CADBURY (m. 1888), associated herself with her husband's philanthropic undertakings at Bournville and elsewhere, besides holding many responsible positions on her own account. She was president of the N.U.W.W. and also of the midland division of the Y.W.C.A., and was the author of several papers on housing and other social questions. She was made O.B.E. in Jan. 1918.

CADOGAN, GEORGE HENRY CADOGAN, 5TH EARL (1840–1915), British politician (*see* 4.932), died in London March 6 1915.

CADORNA, COUNT LUIGI (1850–), Italian general, chief of the Italian general staff from July 1914 to Nov. 1917, commander-in-chief of the Italian armies in the field from May 1915 to Nov. 1917, and senator, was born at Pallanza, on Lago Maggiore, Sept. 4 1850. His father was Count Raffaele Cadorna, a distinguished soldier of the wars of the Risorgimento and the Crimea; and his uncle, Count Carlo Cadorna, was one of the outstanding political figures of the same period. Luigi Cadorna entered the army in 1866, and served in the infantry, in the artillery and on the staff, becoming colonel in 1892. His career followed the usual course and his reputation steadily increased. Lieutenant-general in 1905, he was appointed to command the Genoa army corps in 1910, and a year later he was chosen as an army commander in the event of war. He commanded one side in the manœuvres of 1911, his opponent being Caneva. The victory was adjudged to Caneva, and though military opinion was divided upon the verdict it is probable that the result of the manœuvres led to the preference being given to Caneva for the command of the Tripoli expedition. But on the death of Gen. Pollio, chief of the general staff, there was little or no question as to his successor, and on July 10 1914 Cadorna received the appointment. He found the army in a deplorable condition, both as to personnel and as to material. And within three weeks the outbreak of general war forced the problems of army reform, consistently shirked by successive Cabinets, to the front. One of Cadorna's first acts on becoming chief-of-staff was to adopt the Deport field-gun, though the artillery had already begun to re-arm with a Krupp quick-firer, and this prompt decision, which did not pass without criticism, was of the greatest value to Italy. Much was accomplished during the neutrality period, and though all efforts were handicapped by lack of money and by Italy's low industrial capacity, still, in the interval between Aug. 1914 and Italy's entry into the war, Cadorna fashioned a weapon with which it was possible to strike, and strike hard.

For 29 months Cadorna, handicapped always by lack of means, directed the operations against Austria-Hungary with insight, vigour and determination. Facile critics have found fault with his plan of campaign, but the more carefully and objectively Cadorna's plan is studied, the more it justifies itself against alternative policies. For a year Cadorna had the full confidence of his country, and his name, indeed, began to take on a legendary colour. The first check came with the initial success of the Austrian offensive in May 1916, though he had already incurred many enmities by the ruthless dismissal of those who appeared unequal to the duties of command—a process which in a great measure attained the desired end, though the dismissals were probably too numerous and certainly cost the army some good officers, besides handicapping others by the fear of supersession. As time went on, and signs of war-weariness became visible among some of the troops, Cadorna entered the strongest protest against the policy of the Government, which, he said, permitted an anti-war propaganda which lowered the *moral* of the army. Cadorna's protests were largely justified. Too little was done to meet anti-war propaganda, and the soldier who went on leave often returned to the front embittered by having found his family in want, while others who had escaped military service were not only safe but were making money. On the other hand, it must be admitted that a part of the responsibility for declining *moral* lay at Cadorna's own door. For he did not seem to have realized fully the strain of modern war upon the troops, or understood the necessity of lightening that strain by every possible expedient. The disaster of Caporetto, a disaster due to a complex of causes, led to Cadorna being transferred from the command of the Italian armies to the newly formed Allied military council at Versailles. But before he left his command he had organized the resistance on the Piave-Monte Grappa front.

Cadorna came to Versailles under the shadow of defeat, but his personality and military insight speedily impressed his colleagues and removed the initial handicap. It was a misfortune for Italy when, in Feb. 1918, consequent upon the appointment of the Caporetto inquiry commission, it was thought necessary to remove him from Versailles. As a result of the inquiry he was placed on half-pay on Aug. 29 1918, and four days later his definite retirement was gazetted.

In March 1921 Cadorna published a book dealing with his tenure of the post of chief-of-staff (*La Guerra alla Fronte Italiana*), which effectively answered much of the criticism that had been directed against his leadership. But with the passage of time this criticism had already begun to lose force. It was no longer necessary to find a scapegoat. More and more it was seen that Cadorna had made the Italian army fit for war, and that he had conducted the campaign under grave handicaps. Perhaps the most serious defect in Cadorna's leadership was that he failed to secure the loyal coöperation of many of his subordinates. The fact that he was not always well served was to some extent due to his methods. A certain friction also characterized Cadorna's relations with two successive Governments—on his side soldierly impatience with political methods and exigencies, and on theirs resentment at his criticisms of policy. Moreover, his belief in the necessity and duty of sacrifice made him slow to realize the limits of ordinary human endurance. But his achievement was great, and he remains, in spite of the disaster that closed his career, the foremost Italian military figure of the war. (W. K. McC.)

CAILLAUX, JOSEPH-MARIE-AUGUSTE (1863–), French politician and financier, was born March 30 1863. After studying law and following lectures at the École des Sciences Politiques he entered the civil service in 1888 as an inspector of finance, and spent most of his official career in Algiers. Standing as a Republican candidate in the elections of 1898 for the department of the Sarthe, in opposition to the Duc de la Rochefoucault-Bisaccia, he was elected to the Chamber of Deputies by 12,929 votes to 11,737. He became Minister of Finance in the Waldeck-Rousseau Cabinet, and after its fall it was not until the Clemenceau Ministry of 1906 that he returned to office again, once more with the portfolio of Finance. In 1911 he became prime minister. Unfortunately it was his ambition to bring France and Germany

together on the common ground of finance, and he failed. He endeavoured, while he was prime minister, to meet the arrogant demands of Germany in Morocco, in the course of protracted and secret negotiations carried out mainly through Baron von Lancken, who was then Chancellor of the German embassy in Paris. These negotiations became known, notably to Clemenceau, and they directly led to the dispatch by Germany to Agadir of the gunboat "Panther" in 1911. The convention which put an end to the ensuing crisis involved the surrender by France of large tracts of the French Congo to Germany. The whole negotiations formed the subject of an inquiry by a special committee of the Senate, whose report was very unfavourable to Caillaux. Nevertheless, thanks to his undoubted qualities as a financier, he remained a great power in French politics. He fought the Three Years' Service bill with the utmost tenacity; and although that measure became law, it was he who finally, on the financial aspect of that bill, brought about the downfall of the Barthou Ministry in the autumn of 1913. His past history was of a character which made it impossible, if the Entente Cordiale was to continue, that he should return to the position of prime minister, but he joined the new Cabinet as Minister of Finance. As a financial expert he had for long identified himself with a great and necessary reform in the fiscal policy of France—the introduction of the principle of an income tax. For this principle he strove —in public, at any rate—throughout the winter of 1913. His advocacy of an income tax and his uncertain and erratic championship of proletarian ideas, alarmed all the conservative elements in the country, and throughout the winter he was attacked with increasing violence from the platform and through the press. Those attacks reached their highest point of bitterness in a series of disclosures in the *Figaro*, of a more or less personal nature. This newspaper started the publication of letters addressed by him to the second Mme. Caillaux while he was still married to the first. A tragic end was made to the *Figaro's* campaign when the second Mme. Caillaux called upon the editor, M. Gaston Calmette, and fired five shots at him on March 16, mortally wounding him. Caillaux's resignation followed at once. The elections which took place shortly afterwards resulted in a crisis of unusual bitterness, which was solved eventually by Viviani becoming prime minister. The trial of Mme. Caillaux for murder began on July 20 1914 and ended by her acquittal on the very eve of war.

During the first part of the World War, Caillaux, who was by no means a popular figure, filled the duties of an army paymaster. After one or two scenes in Paris he was sent on a mission to South America. He returned in 1915, and at once attracted every effort of the German secret service. Although taking no overt part in politics he carried on a lobby campaign; he financed newspapers, and did everything he possibly could behind the scenes to consolidate his position. He became acquainted with the Bolos and the Malvys of political and journalistic life, and his activities aroused the alarm of all French patriots. By the spring of 1917 he had become in the eyes of the public "*l'homme de la défaite*"—*i.e.* the man who was willing to effect a compromise peace with Germany at the expense of Great Britain. The long political intrigue (*see* FRANCE: *History*) which led to the advent of Clemenceau to power killed all his hopes. Caillaux was arrested, and, after long delay, tried on a charge of high treason by the High Court of the Senate, and sentenced to three years' imprisonment, the term he had already served, and to the prohibition of residence in French territory for five years and deprivation of civil rights for ten years.

CAILLETET, LOUIS PAUL (1832–1913), French chemist, was born at Châtillon-sur-Seine Sept. 21 1832. He was a pioneer in experimental work with the liquefaction of gases (*see* 16.745 and 757). He died in Paris Jan. 4 1913.

CAINE, SIR THOMAS HENRY HALL (1853–), English novelist (*see* 4.949), was created K.B.E. in 1918, in recognition of his war services, especially in propaganda work. In 1914–5 he edited *King Albert's Book*, a coöperative contribution in honour of Belgium. In 1916 he wrote a play *The Iron Hand;* another play, *The Prime Minister*, was produced at the Royalty theatre, London, in 1918.

CAIRO, Egypt (*see* 4.953).—At the census of 1917 Cairo had a pop. of 790,939, being the largest city in Africa. The Moslem pop. numbered 631,163, Christian 128,991 (including 5,589 Protestants), Jewish 20,207 and others 1,578. Classified by nationality the numbers were:—Egyptian subjects 721,972, Italians 15,655, Greeks 15,254, Ottomans 12,081, French 8,252, British 7,524 (including Maltese 1,663 and other naturalized British subjects 2,650), Russians 1,242, Austrians 1,004, Spanish 627, Rumanians 528, Swiss 280, Belgians 266.

The work of improving communications, providing the city with a new sanitary system and the preservation of ancient sites and buildings was carried on with vigour up to the time of the outbreak of the World War. A new bridge across the Nile at Bulaq was completed in 1912, after four years' labour. A carriage road to Helwan was opened for traffic in 1913. The principal works of the main drainage system were finished in 1914. The Heliopolis oasis scheme (launched in 1906) had by 1914 resulted in the building of a handsome residential suburb, and here was erected a wireless station and a large aerodrome. This aerodrome became the chief airstation in North Africa, being the starting point for air travel to the Cape, Palestine and Mesopotamia and to Europe. During the World War the removal of the huge and ancient rubbish mounds E. of the city was undertaken; their removal offered a large and healthy site for a new suburb. In 1919 the building of various new government offices was begun.

A law passed in 1918 enlarged the scope of the department charged with the preservation of Arab monuments to include all buildings dating from the Arab conquest to the reign of Mehemet Ali, specially citing Coptic ecclesiastic buildings and the Roman fortress of Qasr esh Sham at Old Cairo. Important excavations were made in that fortress. The restoration of the mosque of Ibn Tulun (A.D. 879) was the chief archaeological work vigorously prosecuted during the World War. The mosque of Bibars (A.D. 1269) was in 1918–9 rescued from being a slaughterhouse and its great court turned into a public garden. Large public gardens were constructed at Bulaq and around the Daher mosque. The Sultania library was reorganized and in 1920 contained 92,000 volumes; 40,000 in the Oriental section.

All larger town-planning schemes had to be abandoned during the World War, and building activity was greatly restricted, while over 800 houses had to be demolished in 1916, having been rendered insecure by infiltration during the high Nile flood of that year. The housing difficulty remained acute in 1920.

The presence during 1914–8 of large numbers of white soldiers, unaccustomed to Oriental ways, did not, however, give rise to the trouble anticipated. The political history of Cairo is indistinguishable from that of Egypt, but mention may be made of serious rioting in March 1919, following the deportation of Zaghlul Pasha and three of his associates. (F. R. C.)

CALGARY, Alberta, Canada (*see* 4.1004), had in 1920 a pop. of 75,000. It is the centre of the ranching and grain-producing region of central and southern Alberta, the western general headquarters of the Canadian Pacific Railway, and an important station of the Royal Canadian Mounted (formerly Royal North-West Mounted) Police. Large water-power stations, lumbermills, lighting-plants, banks, wholesale houses, first-class hotels, churches, private and public schools, and a Government creamery all go to constitute a flourishing city. Four miles south of Calgary is situated the Agricultural Experimental Station under irrigation maintained by the Provincial Government—one of the largest of its kind in the world. In addition to its prominence as a pure-bred stock centre, Calgary is fast growing as a manufacturing city, and year by year extends the range of its industries, which at present include beet sugar, soap, furniture, boilers, farm implements, and miscellaneous machinery. The city council is composed of a mayor and 12 aldermen.

CALIFORNIA (*see* 5.7).—In 1920 the pop. was 3,426,861, as against 2,377,549 in 1910, an increase of 1,049,312, or 44·1%, as compared with 60·1% for the preceding decade. During 1910–20 the Japanese increased from 41,356 to 71,952; the Chinese decreased from 36,248 to 28,812. The density of pop. in 1920 was 22 to the sq. m.; in 1910 15·3. The urban pop. (in places of 2,500 or more) increased from 61·8% of the whole in 1910 to 68% in 1920, the urban pop. in the latter year being 2,331,729. Of the 185 cities in the state, only three, Los Angeles, San Francisco, and Oakland, had in 1920 more than 100,000 inhabitants. The table on the next page shows the growth during the decade 1910–20 of the 12 cities which in 1920 had a pop. of 25,000 or more.

	1920	1910	Increase %
Los Angeles	576,673	319,198	80·7
San Francisco	506,676	416,912	21·5
Oakland	216,261	150,174	44·0
San Diego	74,683	39,578	88·7
Sacramento	65,908	44,696	47·5
Berkeley	56,036	40,434	38·6
Long Beach	55,593	17,809	212·2
Pasadena	45,354	30,291	49·7
Fresno	45,086	24,892	81·1
Stockton	40,296	23,253	73·3
San Jose	39,642	28,946	37·0
Alameda	28,806	23,383	23·2

Agriculture.—During the decade 1910–20 the number of farms increased from 88,197 to 117,670, or 33·4%; all land in farms increased from 27,931,444 ac. to 29,365,667 ac.; improved land increased from 11,389,894 ac. to 11,878,339 ac. The value of all farm property rose from $1,614,694,584 in 1910 to $3,431,021,861 in 1920. The average acreage per farm decreased from 316·7 ac. in 1910 to 249·6 ac. in 1920; the average value per acre increased from $47.16 to $94.77. In 1920 over 4,000,000 ac. were under irrigation. Of domestic animals on farms in 1920, there were 402,407 horses, valued at $35,416,507; 63,419 mules, valued at $7,221,930; 1,229,086 beef cattle, valued at $61,280,293; 778,951 dairy cattle, valued at $59,401,153; 2,400,151 sheep, valued at $25,906,445; 909,272 swine, valued at $13,850,907. Poultry was valued at $15,293,570, and hives of bees at $1,469,447. The total wool production for 1919 was 15,216,957 lb. valued at $6,695,461.

The following table shows comparative acreage, production and value of the chief crops for 1909 and 1919:—

		Acreage	Production	Value
Corn	1919	116,740	3,448,459 bus.	$ 5,862,383
"	1909	51,935	1,273,901 "	1,077,411
Oats	1919	146,889	2,966,776 "	2,966,776
"	1909	192,158	4,143,688 "	2,637,047
Wheat	1919	1,086,428	16,866,882 "	36,938,477
"	1909	478,217	6,203,206 "	6,323,983
Barley	1919	987,068	21,897,283 "	35,035,654
"	1909	1,195,158	26,441,954 "	17,184,508
Beans	1919	471,674	6,552,951 "	30,798,869
"	1909	157,987	3,328,218 "	6,295,457
Potatoes	1919	63,305	8,217,937 "	18,901,258
"	1909	67,688	9,824,005 "	4,879,449
Hay and forage	1919	2,202,853	4,494,940 tons	96,121,846
" " "	1909	2,534,235	4,331,885 "	42,206,252
Hops	1919	8,118	12,610,055 lb.	6,557,229
"	1909	8,391	11,994,953 "	1,731,110
Cotton	1919	87,308	46,418 bales	9,237,182
"	1909	324	183 "	11,744

Cotton during the decade showed a remarkable increase in production and obtained the rank of a staple crop. The production of rice passed beyond the experimental stage and in 1919, from 130,367 ac. were produced 6,926,313 bus., valued at $20,432,627. The production of sugar beets, 843,269 tons, valued at $4,313,981 in 1909, fell to 666,866 tons in 1919, valued, however, at $8,669,258. In 1919 the total production of orchard fruits was 47,557,570 bus., valued at $91,687,814. The most important were peaches ($20,542,787), plums and prunes ($28,381,734), apples ($12,155,128) and apricots ($11,815,290). The production of oranges in 1919 was 21,628,444 boxes, valued at $67,048,178. Among the more recent commercial fruits are alligator pears (avocados), of which 7,919 crates were produced in 1919, valued at $63,352.

Minerals.—The total value of mineral products for 1910 was $86,688,347. California was the second state in gold production with 988,853 fine oz., valued at $20,441,400. Gold production for 1919 was 841,638 fine oz., valued at $17,398,200; silver 1,153,614 fine oz., valued at $1,293,051. Copper production fell to 22,299,656 lb., valued at $4,236,934, as compared with 47,674,660 lb. in 1918, valued at $11,775,641. Lead production fell in 1919 to 4,455,161 lb., valued at $253,944, as compared with 13,372,049 lb. in 1918, valued at $506,087; quicksilver to 14,941 flasks, as compared with 22,621 in 1918. The oil output for 1918 was 97,531,997 barrels.

Manufactures.—The following preliminary figures show the growth in manufactures between 1914 and 1919:—

	1919	1914
Establishments	11,943	10,057
Persons engaged	296,999	176,547
Proprietors and firm members	12,460	10,429
Wage-earners (average)	243,794	139,481
Capital	$1,333,382,000	$736,105,455
Wages	304,523,000	105,612,681
Cost of materials	1,218,890,000	447,474,531
Value of product	1,981,443,000	712,800,764
Value added by manufacture	762,553,000	265,326,233

The principal industries in 1914 were canning and preserving, $61,162,849; petroleum refining, $55,527,651; lumber and timber products, $52,860,272; slaughtering and meat packing, $50,011,820; printing and publishing, $34,774,879; foundry and machine-shop products, $31,732,384; flour-mill and grist-mill products, $24,078,735; bread and other bakery products, $21,855,181; butter, cheese, and condensed milk, $20,466,428; cars and general shop construction, and repairs by steam-railway companies, $17,199,717; and beet sugar, $15,528,666. California ranked ninth state in the total value of manufactured products; first in the canning industry and in the production of crude petroleum; second in petroleum refining, exceeded only by New Jersey; and third in lumber and timber products.

Communications.—In June 1910 the total railway mileage was 7,545 m. of main track. The total mileage, Jan. 1 1919, was 8,268, or 5·31 m. per 100 sq. m. of territory. The chief railways were the Southern Pacific, the Atchison, Topeka and Santa Fé (both trans-continental lines), and the San Pedro, Los Angeles and Salt Lake. Since 1910 there has been rapid improvement of highways. In that year for the first time bonds, amounting to $18,000,000, were issued for developing an excellent system of roads. In 1916 a second issue of $15,000,000 was made, and in 1919 the voters adopted a constitutional amendment providing for the issue of $40,000,000 to complete the projected system. By the close of 1920 about $36,000,000 had been expended. From June 1916 to June 1920 the improved roads had been increased from about 1,127 m. to about 2,493 m., and about 3,067 m. of the project yet remained to be improved. The larger part of the system consisted of cement concrete base with thin bituminous top. Steamship communication increased rapidly during the period 1909–20. About $12,000,000 was expended on improving San Pedro Bay and the harbour of Los Angeles.

Banking and Finance.—On June 30 1920 of 723 banks reporting the capital stock paid in was $151,585,000, and aggregate resources $2,499,597,000. Between 1912 and 1920 the number of national banks in the state increased from 231 to 310, and their total resources from $561,214,000 to $1,092,956,000. During the same period the number of savings banks decreased from 132 to 106; depositors increased from 597,159 to 853,530, and deposits from $407,006,665 to $875,951,000. The average for each depositor increased from $681.16 in 1912 to $1,026.27 in 1920. The cash in the state treasury July 1 1910 was $7,201,220. The receipts for the fiscal year ending June 1911 were $18,843,854; expenditures $18,591,471. Total receipts for the fiscal year ending June 1919 were $50,132,900; expenditures $50,691,433. Cash on hand July 1 1919 was $14,140,661. On the same date the assessed valuation on taxable property was $4,023,000,588. The net bonded debt was $44,138,500.

Education.—From 1910 to 1917 the number of pupils enrolled in the public schools increased from 349,145 to 569,284, and teachers from 10,769 to 19,074. The value of school property in 1910 was $38,661,761; in 1917 it was $92,800,821. Expenditures for public schools in 1910 were $6,000,000; in 1917 $34,133,122. In 1917 the average salary in the elementary schools was $81.74 per month; in the high schools $1,473 per year.

History.—Many amendments to the constitution were ratified during the decade 1910–20. Among the more important were those for the initiative and referendum, the recall (including the recall of judges), woman suffrage, the granting of larger powers to the state railway commission, adoption of the short ballot, all these in 1911; in 1912 the provision of a uniform series of text-books for use in elementary schools together with their free distribution. In 1914 a proposed prohibition amendment to the constitution was defeated. In 1914 and again in 1920 the proposal of the Legislature that a convention be called to revise the constitution was overwhelmingly defeated. Important legislation included a workmen's compensation Act and the limiting of the hours of women's labour to 8 hours a day or 48 hours a week (1911); an Act providing for the confinement and care of drug addicts (1912); mothers' pensions; a blue sky law, designed to protect investors against unscrupulous promoters; and the sterilization of persons twice imprisoned for sexual crime (1913); provision for absent voting by those engaged in national service, for creating a state council of national defense to coöperate with the Federal Council of National Defense, and for the regulation of stages and automobiles, operating as common carriers over definite routes (1917); a compulsory part-time education law; vocational reëducation of workmen disabled in industry; raising of compulsory school age limit from 15 to 16; creation of a department of agriculture; provision of an industrial farm for the rehabilitation of fallen women; and ratification of Federal prohibition (1919).

In Nov. 1910 Hiram W. Johnson was elected governor. He had travelled through the state, attacking the "special interests," particularly the Southern Pacific railway, which he accused

of improper influence in state legislation. His remarkable success in carrying through a comprehensive programme of legislation is shown by the passage of the measures referred to. When, following the break in the Republican party in 1912, the National Progressive party was organized, Johnson was nominated for vice-president on the ticket with Theodore Roosevelt. In the succeeding election the results were extraordinarily close and long in doubt; Roosevelt secured a plurality of 174 over Woodrow Wilson, the Democratic candidate, the popular vote being 283,610 for Roosevelt and 283,436 for Wilson. In 1916 the popular presidential vote was almost equally close but reversed, 466,289 for Wilson and 462,516 for Hughes, the former receiving a plurality of 3,773. At this election women voted in the presidential campaign for the first time. In 1920 the popular vote for president was 624,992 for Harding and 229,191 for Cox. In 1916 Gov. Johnson was elected to the U.S. Senate, taking his seat on March 4 following. Beginning Oct. 9 1911 attention was centred in the trial in Los Angeles of John J. and James B. McNamara, accused of dynamiting the Los Angeles *Times* building (Oct. 9 1910), resulting in the death of 21 persons. The crime was one of a nation-wide series intended to prevent the use of non-union materials and non-union labour. The defendants were strongly supported by the American Federation of Labor. Later the accused pleaded guilty, and James B. McNamara was sentenced to life imprisonment and John J. McNamara to imprisonment for 15 years.

In 1913 the anti-Japanese feeling throughout the state culminated in the passage of the Webb Alien Land-Holding Act. In 1909 measures had been proposed in the Legislature aimed at preventing the ownership of land by Japanese, but at the request of President Roosevelt these were dropped. Similar measures were introduced in 1913, and on April 13 a measure to that effect passed the Assembly, containing language displeasing to the Japanese Government. President Wilson at once communicated with Gov. Johnson, urging delay, and with the approval of the Legislature and of the governor, Secretary of State Bryan went to California to counsel moderation or delay in action. But another bill drawn up by Attorney-General Webb for the same purpose passed both Houses of the Legislature on May 3 1913 and was signed by the governor May 10, to be effective Aug. 17. The first two sections of the Webb bill were as follows: (1) "All aliens eligible to citizenship under the laws of the United States may acquire, possess, enjoy, transfer, and inherit real property, or any interest therein, in this state in the same manner and to the same extent as citizens of the United States, except as otherwise provided by the laws of this state. (2) All aliens other than those mentioned in section 1 may acquire, possess, enjoy, and transfer real property, or any interest therein, in the manner and to the extent and for the purpose prescribed by any treaty now existing between the Government of the United States and the nation and country of which such alien is a citizen or subject, and not otherwise." While this bill prevented the Japanese from acquiring land in the state, its supporters held that no treaty rights were infringed, and that Japan could not justly take offence at the language used.

For several years San Francisco had been trying to secure part of the Hetch-Hetchy valley as a reservoir for furnishing water to the city. In 1913 a bill passed Congress, granting this. The question evoked much public discussion on both sides. Gifford Pinchot, the well-known conservationist, supported the project, while the naturalist, John Muir, strongly opposed it. The Panama-Pacific International Exposition, celebrating the opening of the Panama Canal, was held Feb.–Dec. 1915, at San Francisco. At the same time an exposition was held in San Diego, devoted chiefly to the display of California products. The state supplied to the army during the World War 112,514 men (excluding officers). The subscriptions to the four Liberty Loans in order were $100,190,900, $159,362,100, $174,506,200, $291,126,700; to the Victory Loan, $186,702,950.

Recent governors were James N. Gillett (Rep.), 1907–11; Hiram W. Johnson (Progressive Rep.), 1911–7; William D. Stephens (Rep.), 1917–.

CALIFORNIA, UNIVERSITY OF (*see* 5.22).—During the decade 1910–20 the university of California grew to such an extent that in the latter year it stood foremost in number of students among American universities. In the degree-giving departments on Nov. 1 1920 the enrolment was as follows: at Berkeley, in the schools of Letters and Science, Engineering, Agriculture, Chemistry, Commerce, Jurisprudence, Medicine (part), Education and Architecture, 8,726 undergraduates, of whom 4,757 were men and 3,969 women; and 943 graduates, of whom 484 were men and 459 women; at San Francisco, in the Hastings School of Law, schools of Medicine (part), Dentistry, Pharmacy, Hooper Foundation for Medical Research, 656 students; at Los Angeles, in the southern branch (instruction in lower division), 872 students, and in the teachers' curricula, 1,108 students; making a total, less duplicates, of 11,197. There were in the university extension division courses 13,702; in the agricultural extension courses 5,625; in the summer session and intersession courses 6,436, and on the University of California Farm 530, making a grand total, less duplicates, of 37,480.

Between 1910 and 1920 many new buildings were erected, the most important being the Boalt Hall of Law (1911), costing $190,000, partly the gift of Mrs. Elizabeth Josselyn Boalt as a memorial to Judge Boalt and partly subscribed to by the lawyers of California; Agriculture Hall (1912), costing $267,000; Benjamin Ide Wheeler Hall (1917), costing $700,000, and Hilgard Hall (1917) costing $350,000, both buildings the gift of the people of California; Gilman Hall for the Chemistry department (1917), costing $197,000; Sather Tower (1914), costing $200,000 besides $25,000 for bells; and the University Library, completed in 1917 at a cost of $1,442,339.41, of which $730,000 was bequeathed by Charles Franklin Doe. The number of volumes in the library was 427,930 in 1920.

After twenty years of service Dr. Benjamin Ide Wheeler resigned the office of president July 15 1919, and on Dec. 2 1919 Dr. David P. Barrows, head of the department of Political Science, took his place as 9th president. Mrs. Phoebe Apperson Hearst, for 22 years a regent of the university, died April 13 1919. Among her many gifts were the Hearst Mining Building, Hearst Hall, scholarships amounting to more than $30,000; contributions to the Anthropological museum, $130,000; and the swimming pool for women. The death of Henry Morse Stephens, for 17 years a professor in the university, occurred in 1919. In his memory his friends planned to erect a $300,000 Student Union building to be known by his name, and also to raise a sum of money to support one or more travelling fellowships in Europe for university graduates in history.

The endowment of the university in 1920 was $7,253,926 57, yielding a gross income of $368,821.04. The total assets, including real estate and improvements, were $23,117,236.62. From July 1 1919 to June 30 1920 the income of the university, from the U.S. Government, was $159,338.90; from state appropriations, $2,722,904.37; from students' fees and deposits $594,210.96; from hospitals, infirmary and the professional colleges $501,706.83; from departmental sales and miscellaneous receipts $546,432.09; from gifts for current use $110,718.75; from gifts for buildings and equipment $302,263 82; and from gifts for endowment $530,343.86; making, with the income from endowment mentioned above, a total from all sources of $5,844,464.13.

In the World War 4,158 men and 36 women connected with the university served with the colours. This number is exclusive of the S.A.T.C. unit at the university with 1,926 men and 56 officers, and the Naval Unit with 498 men and nine officers. Fifty-four per cent of the enlisted personnel received commissions. Of the 121 faculty members in the service, 103 were commissioned. (D. P. B.)

CALMETTE, GASTON (1858–1914), French journalist and writer, was born at Montpellier July 30 1858. He was educated at Nice, Bordeaux, Clermont-Ferrand and Mâcon, and afterwards entered journalism. In 1884 he joined the staff of the *Figaro*, and in 1894 became its editor. Calmette came much into public notice in 1913 and 1914 as the leader and inspirer of the bitter attacks on the policy of M. Caillaux. Almost every day the *Figaro* produced evidence of a damaging sort against the minister with the object of proving that he used his official position to facilitate speculation on the Bourse. The attitude of M. Caillaux in the Rochette case of 1911, in which it was alleged by the *Figaro* that the director of public prosecutions had been influenced by the ministry to delay the course of justice, was brought forward, and a newspaper campaign of extraordinary violence was the result. M. Caillaux was urged by some of his colleagues to take legal proceedings against his accusers, but declined. Some days later (March 17 1914) Mme. Caillaux called at the office of the *Figaro* and shot M. Calmette dead

with a revolver. The unfortunate journalist was well known for his interest in art, and possessed a fine collection of caricatures and engravings of the First Empire.

CAMBON, PAUL PIERRE (1843–), French diplomatist (*see* 5.85), was appointed French ambassador in London in 1898. His career at the London embassy was brilliant in the extreme. He was one of the leading artisans of the Entente Cordiale, and played a very important part in frustrating the efforts made by Germany to separate France and Great Britain in 1914 on the eve of the World War and in maintaining good Franco-British relations during the peace negotiations. He resigned his post in Nov. 1920.

His brother, JULES MARTIN CAMBON (1845–), had become French ambassador at Berlin in 1907, and was there when the World War opened. He reached France from his post in Berlin after a journey in the course of which he was subjected by the Germans to many indignities. He had been a close observer of Germany's year-long preparations for war. He became General Secretary of the Foreign Office during M. Briand's war term of office, a post which he occupied with distinction. He was also elected a member of the French Academy.

CAMBRAI, BATTLE OF (1917): *see* ARTOIS, BATTLES IN; also TANKS.

CAMBRAI-ST. QUENTIN, BATTLE OF (Aug. 26–Oct. 5 1918).—The first stage of the British offensive in Aug. 1918, the battle of Amiens, had been successfully accomplished, and the second stage, the battle of Bapaume–Péronne, was making good progress (*see* SOMME, BATTLES OF THE) when it was considered by British G.H.Q. that on Aug. 25 (to use the words of Lord Haig) "the proper moment had come for the third stage of the operations, in which the First Army should extend the flank of our attack to the north. By driving eastward from Arras, covered on the left by the rivers Scarpe and Sensée, the First Army would endeavour to turn the enemy's positions on the Somme battlefield and cut his system of railway communications which ran south-westward across their front." See map, Plate I.

1. *Operations of the First Army* (*Aug. 26–Sept. 26*).—The forces at the disposal of Gen. Horne's First Army for these operations consisted of the I. and VIII. Corps, to which the Canadian Corps was now added. This last-named formation began to arrive in the army area on Aug. 22, and was put into line on the right or southern wing of the army. Thus the front on Aug. 25, the eve of the offensive, was held as follows, from right to left: Canadian Corps (Currie) (2nd Canadian, 3rd Canadian and 51st Div. in line, 1st Canadian Div. in reserve); VIII. Corps (Hunter-Weston) (8th and 20th Div. in line, 24th Div. in reserve); and I. Corps (Holland) (55th and 16th Div. in line, 15th Div. in reserve). Of these forces, however, only those astride the Scarpe, *i.e.* the Canadian Corps, were to be engaged, the main axis of the attack being the line of the Arras–Cambrai road; the two remaining corps were to stand fast, while making all endeavours to deceive the enemy and prevent him dispatching reënforcements to other threatened points. The VIII. and I. Corps therefore will not come again into this narrative.

Facing the right of the First Army were the German I. Bavarian Reserve Corps astride the Scarpe and the II. Bavarian Corps as far south as the Arras–Cambrai railway. These two corps formed the right of the Seventeenth Army and had divisions in line. They held the old German trenches of 1916 from W. of Gavrelle in the N., by Fampoux, Feuchy, and Tilloy to Neuville Vitasse in the south. Behind them lay a succession of strongly fortified zones—first, the old British and German defences of 1917 covering all the ground W. of the Cojeul river; next the Frèsnes–Rouvroy line and the Vis en Artois switches and finally the Drocourt–Quéant line. To the E. of this, the last artificial position, there lay the strong natural defence line of the Canal du Nord covering Cambrai. The task upon which the First Army was about to embark was thus no easy one.

The Canadian attack was timed for 3 A.M. on Aug. 26—that is, well before dawn. Some 45 tanks were available, and owing to the absence of some of the corps artillery only 600 guns covered the advance. Two objectives were assigned, the first running E. of Fampoux and W. of Monchy and Wancourt, the second including Roeux, Monchy and Guémappe, while exploitation was to be carried out beyond this latter line as far as possible.

The operation was carried out exactly as ordered. The Germans opposite the Canadians appear to have been warned of the attack and to have thinned out their front line, so that resistance was weak at first. Heavy fighting, however, took place for the second objective, particularly in the southern sector, where the 2nd Canadian Div. was operating; here the ridge E. of Wancourt and Guémappe was not finally secured till late at night. The 3rd Canadian Div. had pushed its troops beyond Monchy and up to the edge of Pelves by midday, while N. of the Scarpe the 51st Div., advancing at 9 A.M., occupied Fampoux and Gavrelle with little opposition. The Germans delivered counter-attacks S. of the river without success and at the end of the day the Canadians had penetrated into and maintained themselves within the enemy defences some two and a half miles to the E. of their starting points.

The operations were continued during the following two days by the same divisions in line. The 3rd Canadian Div., moving off at 4:55 A.M. on the 27th, met with steadily increasing hostile resistance, chiefly on the left in the Scarpe valley; the 2nd Canadian Div. commenced its advance only at 10 A.M. Both made progress, and by the evening had reached the line of the Sensée, between Cherisy and Rémy. The Canadians now found themselves in front of the Frèsnes–Rouvroy line, which in this sector ran from N. of Hendecourt by Rémy and Boiry to Biache, and the capture of this line was assigned as the objective for the 28th. The divisions again advanced at different hours, the 3rd at 9 A.M., the 2nd at 12:30 P.M., and the brigades and battalions also attacked in succession from the left, thus enabling all the artillery available to unite in covering the advance of each unit in turn. This method proved highly successful on the left, where by the end of the day the 3rd Div. was in possession of the Frèsnes–Rouvroy line along its entire front; the 2nd Div., however, despite valiant efforts, was unable to make much progress.

That night the divisions in line were relieved, the 1st Canadian Div. coming in on the right, the 4th British Div. on the left. The next few days were devoted to preparations for the attack on the Drocourt–Quéant line, timed for Sept. 1 but later postponed to the 2nd. Artillery and bridging material were brought forward and wire-cutting commenced, while a series of partial infantry attacks took place with the object of securing suitable jumping-off ground. The XXII. Corps (Godley) was now brought in on the Canadian left; the 11th Div. was put in on the N. bank of the Scarpe and the 51st and 8th taken over from the Canadians and VIII. Corps respectively; the 49th Div. was retained in reserve. As a result of the local operations carried out on both banks of the river, Arleux and Plouvain fell into the hands of the XXII. Corps, and the Canadians completed the capture of the remaining German positions W. of the Drocourt–Quéant line. By the evening of Sept. 1 all was ready for the morrow's attack.

This was to be carried out by the 1st Canadian Div. on the right, the 4th Canadian Div. in the centre, and the 4th British Div. on the left on the front from N. of Hendecourt to W. of Sailly, measuring some $5\frac{1}{2}$ m. in width. Five hundred guns and 45 tanks were detailed off to assist. The first objective was to be the front and support lines of the Drocourt–Quéant system; the second the W. bank of the Canal du Nord between the Arras–Cambrai road and the Scarpe, and the third a line just to the E. of that obstacle. The XXII. Corps astride the Scarpe was to secure the Canadian left. The XVII. Corps (Ferguson), on the left of the British Third Army, was to advance on the Canadian right, after the capture of the first objective, and by passing through the breach made by the Canadians to turn from the N. all the German defences in the vicinity of Quéant, where the Drocourt–Quéant line joined the main Hindenburg line.

The attack began at 5 A.M., rapidly overran all resistance and by 9:15 A.M. had possessed itself of its first objective on all its

front. The Drocourt–Quéant front and support lines were thus in the hands of the Canadians after little more than four hours' fighting. The operation had been brilliant in the extreme, but the exploitation proved more difficult, as neither tank nor artillery support was available in sufficient strength. As a result the advance on the front of the 4th Canadian and 4th British Div. made no progress beyond the line south of Etaing-Dury. On the right, however, the 1st Canadian Div. got forward beyond Cagnicourt and Villers and established its front some distance to the E. of these places. Meanwhile the XVII. Corps pushed the 57th Div. through the gap opened by the Canadians and swung down astride the Drocourt–Quéant line towards its junction with the Hindenburg line, which was at the same time assailed in front by the 52nd Division. Later in the day the 63rd Div. passed through to continue the advance; by nightfall the tangle of trenches and wire at the junction were in British hands and the villages of Quéant and Pronville had also been wrested from the enemy.

That night the German Seventeenth Army withdrew its two right corps in haste behind the Canal du Nord, where they again faced round for a renewed stand. Their losses had been heavy; 11 divisions had been defeated with a loss of close on 11,000 prisoners and many guns; the artificial defences had not held up or even appreciably checked the British advance, which now threatened to turn from the N. the whole of the Hindenburg line.

Fortunately for the Germans the Canal du Nord proved a sufficiently formidable obstacle to give pause to the First Army's progress. It was decided that that army should halt and reconstitute for the present, as any further advance could only be carried out by a deliberate and carefully planned assault on the canal line. This attack was not to take place till Sept. 27.

In their operations between Aug. 26 and Sept. 3 the 10 British divisions of the First Army had defeated 13 hostile divisions, and taken from them over 16,000 prisoners and 200 guns. The right wing of the German Seventeenth Army had been forced to fall back some 12 m., abandoning in succession a series of strong and well-fortified defensive systems, the loss of which had an instant effect on the situation to the south.

2. *Third Army's Advance to Hindenburg Line (Sept. 3–26).* As a result of the First Army's success the German Seventeenth Army on Sept. 2 was ordered to fall back to the Hindenburg line, and to commence the move that same evening. By Sept. 8 the two corps (III. and XIV. Reserve) which faced the British Third Army had completed their withdrawal and held the fortified front from Sains on the Canal du Nord by Havrincourt to just S. of Gouzeaucourt, with detachments to the W. of this line, established in the old British and German trenches of 1917.

The British Third Army followed up the retreating enemy, being impeded only by rearguards whose resistance was easily overcome, and by Sept. 9 were once more in touch with the main body of the German Seventeenth Army along the whole of its front. At this period the line was held from right to left by the V. Corps (Shute) (21st and 17th Div. in front line, 38th Div. in reserve); the IV. Corps (Harper) (5th New Zealand and 37th Div. in line, 42nd Div. in reserve); the VII. Corps (Haldane) (62nd and 2nd Div. in line, 3rd and Guards Div. in reserve); and the XVII. Corps (Ferguson) (52nd and 63rd Div. in line, 57th Div. in reserve).

In order to obtain observation and jumping-off ground for the attack on the main Hindenburg system it was necessary to clear the enemy from the positions still held by him forward of this line. This was successfully accomplished in two operations, on Sept. 12 and Sept. 18. On the former of these dates the IV. and VI. Corps in the centre of the army advanced on a front of five miles between the Cambrai–Péronne and Cambrai–Bapaume roads. The IV. Corps, attacking with the 37th Div. on the right and the New Zealand Div. on the left, occupied Trescault and the heights north of it, while the 62nd Div. of the VI. Corps carried Havrincourt after stubborn fighting and maintained it in face of a series of counter-attacks, delivered with fresh forces both on this and the following day. The 2nd Div. also made some progress to the N., effectively securing the flank of the 62nd and keeping touch with the XVII. Corps, which had been held up ever since Sept. 2 on the W. bank of the Canal du Nord.

Sept. 18 saw the V. Corps on the right of the Third Army attacking in its turn, in conjunction with the Fourth Army to the south. The 38th Div. was brought up into line for this operation on the left of the 17th, the 21st Div. being on the right of the corps front. The attack was fairly successful, though the 21st Div. was unable to attain all its objectives and the 38th Div. was held up in front of Gouzeaucourt, and a series of further minor attacks on the succeeding days proved necessary before the positions required for the general offensive against the main Hindenburg line were completely secured along the whole front of the Third Army.

3. *Advance of Fourth Army to Hindenburg Line (Sept. 3–26).*—The results of the fighting on the line of the upper Somme and the Tortille at the end of Aug. and the beginning of Sept. had been such as to induce the German Second Army to give up all hope of putting up any further resistance W. of the Hindenburg line, and to order a withdrawal of its troops to that fortified position. Accordingly, from the morning of Sept. 4th, the British Fourth Army was able to make rapid progress along its whole front. The line at the beginning of this advance was held as follows: on the right was the Australian Corps (Monash) with the 32nd, 5th Australian and 3rd Australian Div. in line, and the 1st and 4th Australian Div. in reserve; on the left the III. Corps (Butler) with the 74th and 12th Div. in line and the 58th in reserve. Facing them the front of the German Second Army was held in order from the right by the LIV., XI. and LI. Corps; in all, eight divisions.

The first few days of the British advance passed with little resistance from the enemy, who fell back rapidly under cover of the fire of light machine-guns and isolated field guns. British cavalry and cyclists found some scope for useful activity and considerable progress was made. On Sept. 8, however, the Germans made a stand in the old British battle zone of March 21 on the general line E. of Vermand to E. of Roisel–Epéhy. A series of partial assaults by the various front-line divisions having had little result it became evident that a deliberate attack would be necessary to overcome this obstacle. Accordingly the army front was reorganized, the IX. Corps coming in on the right, taking over the 32nd Div., and putting the 1st into line on its left, with the 6th and 46th in support. Gen. Rawlinson then proposed to undertake an operation on a large scale with the object of capturing the outer defences of the Hindenburg line along the whole front of the Fourth Army. These outer defences consisted of two strongly fortified lines, the first of which had been the German outpost line in the spring of 1917 and the British main line of resistance before March 1918, and the second the British outpost line corresponding to this main line—a less formidable obstacle about a mile farther east. The capture of these defences, which would afford observation over the greater part of the main Hindenburg line proper, was of course an essential preliminary to any operation against the latter.

Accordingly the period from Sept. 11 to 17 was devoted to pushing on the preparations for this projected attack. The line was advanced in several places by means of strong fighting patrols, so as to run on the evening of the 17th from Holnon by Maissemy and Jeancourt to St. Emilie and W. of Epéhy. By this time everything was ready for the general offensive, which was timed to commence at 5:20 A.M. on the 18th in conjunction with the First French Army to the S. and the Third British Army to the north.

It was intended that the advance should be carried out in three stages, the final objective (which it was not considered must necessarily be reached on the first day) being the old British outpost line from Thorigny by Pontruet, W. of Bellicourt and of Bony to W. of Vendhuille. This gave a front of attack of some 14 m. in length and involved an average penetration of 3 miles. Twenty-three tanks joined in the attack, which was preceded by no bombardment but was covered by the fire of 978 guns.

Generally speaking the operations of the Australian Corps in the centre were completely successful, those of the IX. and III.

Corps in the wings less so. The IX. Corps, attacking with the 6th and 1st Div. in line, despite difficulties in assembling its forces, reached its first objectives by 9 A.M., but the 6th Division was held up at Holnon, and was unable to maintain itself in Fresnoy, while the 1st Div. got farther forward, but not as far as Pontruet. The corps lost heavily, though some prisoners and guns were taken. The Australian Corps (4th Div. on the right, 1st on the left) also had heavy fighting, particularly in Levercuier village and the woods N. of it, before reaching its first objective, and was checked in front of the final objective till darkness fell, when the last hostile defences W. of the main Hindenburg line were successfully secured under cover of night. The captures of the corps came to over 4,000 prisoners and 87 guns; the attacking strength of the Australians was less than 6,000 and the casualties were just over 1,000 in all. The III. Corps' attack, carried out by the 74th, 18th, 12th and 58th Div. in line from the right, met with very stubborn opposition; the enemy were expecting the attack and fought well. As a result the progress made was less than had been hoped; only the 74th Div. in fact attained the first objective. The 18th was checked after capturing Ronssoy and the 12th and 58th after taking Epéhy; 2,300 prisoners were taken and 10 guns.

It was decided, in view of the incomplete success attained on this day, that the IX. and III. Corps should continue the attack on the 19th, while the Australians consolidated their gains. A series of partial offensives were therefore undertaken on the succeeding days, on both wings of the army, but with little real result; neither corps could succeed in attaining the final objectives of the first day's attack or clear the enemy entirely from the advanced defences of the Hindenburg line.

Meanwhile it had been definitely decided by British G.H.Q. on Sept. 22 that that line should be attacked along the whole front from the Sensée to N. of St. Quentin by the First, Third and Fourth Armies. To the last named were assigned as reënforcements the XIII. Corps and the II. U.S. Corps; the former was maintained in reserve, but the latter was combined with the Australian Corps and took over the left of its front and the right of the III. Corps front, relieving the 1st Australian, 74th and 18th Div. by Sept. 25. The 74th and 58th Div. now left the Fourth Army, which had thus undergone a net increase from 10 to 14 divisions.

During this redistribution the efforts of the IX. and III. Corps to gain further ground continued without cessation. Sept. 21 and 22 saw some progress by the latter formation, which was not, however, successful in completing the capture of the outer German defences before the right of its line was taken over by the 27th and 30th U.S. Div., nor were the new arrivals who carried out their first attack in France on the 26th and 27th able to advance the line to any real extent. On the other hand, during the period from Sept. 24 to 26 the IX. Corps, by repeated efforts, pushed their front to the E. of Gricourt and Pontruet, thus ensuring favourable conditions for the forthcoming offensive on the right wing of the army.

In the series of operations, described above, the Third and Fourth British Armies had engaged 15 divisions against 29 of the German Second and Seventeenth Armies, and had taken from them close on 12,000 prisoners and 100 guns.

4. *Preparations for Attack against Hindenburg Line* (*Sept. 22–26*).—The Hindenburg line, which now faced the British armies, has been described in detail elsewhere; it will therefore suffice to say here that, together with the Masnières–Beaurevoir line beyond it, it formed a fortified belt some four to six miles in depth, and was in all respects one of the most formidable defensive positions known to history. Despite the risks of failure and the probable consequences of such a failure, from the political and moral as well as the military point of view, it was considered essential both by Marshal Foch and Lord Haig that the attack on it should be carried out and that as soon as possible. In view of the fact that the First and Third British Armies were faced with strong positions in the Canal du Nord and the Scheldt canal, which it was advisable to carry prior to the general attack on the Hindenburg line behind the latter obstacle, it was decided that these two armies should open their operations a day earlier than the Fourth Army, so as to draw off the German reserves from the front of that army, which had to deliver the main attack and was faced with the most formidable defences.

Accordingly the following orders were issued on Sept. 22: "The First Army will attack on Sept. 27 with a view to capturing the heights of Bourlon Wood in the first instance. It will then push forward and secure its left on the Sensée river and operate so as to protect the left of the Third Army. The Third Army will operate in the direction of the general line Le Cateau–Solèsmes. It will attack on Sept. 27 in conjunction with the First Army and will press forward to secure the Canal de l'Escaut, so as to be in a position to coöperate closely with the Fourth Army on Sept. 29. The Third Army will assist the Fourth Army with counter battery work on the enemy's guns in the region La Terrière–Villers Outréaux. The Fourth Army, protected on its right flank by the First French Army, will deliver the main attack against the enemy's defences from Le Tronquoy to Le Catelet, both inclusive, operating in the direction of the general line Bohain–Busigny. The bombardment will commence on Sept. 27 and the assault will be delivered on Sept. 29."

5. *First Army's Advance to Cambrai* (*Sept. 27–Oct. 2*).—At the close of the operations E. of Arras at the beginning of Sept., the right wing of the First Army, consisting of the Canadian and XXII. Corps, stood S. of the Scarpe, facing the obstacle of the Canal du Nord and the Sensée. Behind this strong line of defence the German Seventeenth Army had the I. Bavarian Reserve and the II. Bavarian Corps with five divisions in front line and about twice that number in support. The positions held by them were formidable to a degree; the Canal du Nord, although not completed along all its length, was some 100 ft. in width and its northern half full of water; all the bridges were destroyed, and the E. bank, which commanded the W., had been lined with machine-guns and strongly wired. To the E. of the canal the Germans had as successive defensive positions the Marquion trench line, running from Oisy by Marquion to the main Hindenburg line near Graincourt; the Marcoing line, covering Cambrai at a distance of some two miles from its outskirts; and the Scheldt canal, from the Sensée at Estrun by the western suburbs of the city to Marcoing, Crèvecœur and the south.

The task in front of the First Army was thus an extremely difficult one; none the less it had to be tackled, and as early as Sept. 15 the preliminary measures were taken in hand. The XXII. Corps took over the front from the Sensée southwards to the Arras–Cambrai road, and the Canadians relieved the left of the Third Army as far as N. of Moeuvres. By this means the latter, who were to make the main attack, were brought opposite a portion of the Canal du Nord, which was dry along a front of 1½ miles. The plan was to cross the obstacle here and then to expand the front of attack to a frontage of some 9 m. by pushing out divisions fanwise to E., N.E. and N. It was hoped that the assembly of the attacking troops in the restricted zone opposite the crossing point, the rapid bridging of the dry canal, and the pushing forward of guns to cover the farther advance, and of reinforcements, ammunition and supplies to support it, could all be carried out with the necessary speed and security, although the difficulties to be faced were very great and the possible causes of *contretemps* numerous.

Zero hour was to be 5:20 A.M. on Sept. 27. The 4th Canadian Div. was in line on the right, and the 1st on the left, and were to carry out the first phase of the attack, as far as the line Fontaine Notre Dame–W. of Haynecourt–Sauchy L'Estrée. Up to this line four successive objectives were assigned; from there onwards the second phase of the advance was to carry the assailants to the line of the Scheldt canal and the Sensée. During the pause between these two phases the 3rd Canadian Div. was to come in on the right of the 4th, and the 11th British Div. on the left of the 1st, so that the second phase would be carried out by the 3rd, 4th and 1st Canadian and 11th British Div. in that order from the south.

Punctually at the appointed time, at dawn on Sept. 27, the assault was delivered. The crossing of the narrow defile over the

canal between Inchy and Moeuvres was carried out according to programme, thanks in large measure to the intensity of the barrage covering the operation. All the field artillery of the Canadian and XVII. Corps were firing on this area, and as a frontage of only 9 yd. was allotted to each gun the resistance of the enemy was speedily stifled. While the infantry pressed forward to carry the Marquion line bridges were swiftly thrown over the dry canal bed, and batteries went over at a gallop to take up their positions for supporting the farther advance. The first objective and part of the second were carried on time and without great difficulty, but the left of the 1st Canadian Div., swinging to the left against Marquion, was checked for a time, until reënforcements, including units of the 11th Div., came up to complete the capture of the village and its defences. The second objective was in Allied hands by midday everywhere. Further progress was difficult, particularly on the right, where the 4th Canadian Div., which had outstripped the advance of the left of the Third Army, was held up by flanking fire and counter-attacks from the S., and was unable to do more than establish itself on the fourth objective by the evening, with its right thrown back along the Bapaume–Cambrai road. On this line it was relieved during the night by the 3rd Canadian Div. Farther to the N., the first phase of the attack was successfully completed by 2 P.M., and it was found possible to commence the second phase at 3:20 P.M.

At this hour the 1st Canadian and 11th Div. moved forward. The former stormed Haynecourt, pressed up to and beyond the Douai–Cambrai road E. of that village, and maintained its position despite repeated and violent hostile efforts to regain the lost ground. The 11th Div. also met with great success, and before nightfall was in possession of Sauchy Cauchy, Sauchy L'Estrée, Oisy and Epinoy.

The line therefore at the end of the day ran from just W. of Fontaine Notre Dame to the Douai–Cambrai road N.E. of Haynecourt, thence to Epinoy and Oisy le Verger. Four thousand prisoners and 100 guns had been taken in this day's advance of some 7,000 yd. in depth on a front of 15,000. The whole operation, investing as it did a most complicated and yet perfect combined action, had been a most brilliant success.

It was decided that the attack should be continued on the 28th, the 3rd and 4th Canadian Div. on the right and the 11th Div. on the left advancing at 6 A.M., while the 1st Canadian Div., which was farther advanced than they, followed suit only at 8 A.M. The Germans resisted stoutly all along the line, but were unable to stem the drive. On the right the 3rd Div. cleared Fontaine Notre Dame and the 4th Sailly and were then held up for the time being in front of the Marcoing line, which, however, was completely cleared later in the evening by a renewed attack. The 1st Div. made little headway, but the 11th Div. got well forward along its front and established itself from Epinoy to Aubencheul on the Sensée. Large captures were made besides the substantial gain of ground.

At the same hour on the 29th the infantry again went forward, the objectives being to complete the capture of the Marcoing line and the seizure of the Scheldt canal bridges W. and N. of Cambrai. The 11th Div. made no progress, but the line on the rest of the front was advanced to the junction of the roads from Arras and Bapaume in the suburbs of Cambrai and the line of the Douai–Cambrai road and railway, including the village of Sancourt. A certain amount of ground gained beyond the railway had to be evacuated before the violent counter-blows of the enemy against the left of the 1st and then of the 4th Div.

None the less neither side was prepared to give up the struggle. At dawn next day the 3rd and 4th Canadian Div. advanced once more with the object of securing the coveted bridges over the Scheldt canal, to be followed later by the 1st Canadian and 11th Div., which were to clear the peninsula between that canal and the Sensée. A certain amount of progress was made, the village of Tilloy being entered by the 3rd Div. and Blécourt by the 4th Div., but not all these gains could be maintained in face of repeated hostile counter-attacks, and at the end of the day the line ran much as before on the front of these two divisions. The second phase of the offensive as planned could not even be commenced. Another effort was made on the morrow to complete the operation. It met with stubborn resistance from German divisions in line, now increased to ten. These endeavoured again and again to check the Canadian advance by blows against their left front and left from the direction of the confluence of the Sensée and the Scheldt canal. The Canadian advance began at 5 A.M. and went well despite all obstacles. The 3rd and 4th Div. attained their objectives—the line of the canal south of Ramillies and the road between that place and Cuvillers. The 1st Div. had even more desperate fighting before it succeeded in clearing Blécourt, Cuvillers and Bantigny, and when it had finally captured them a powerful thrust against its exposed left from the direction of Paillencourt forced back the Canadian line to the west of Cuvillers and Bantigny. Meanwhile the 11th Div. on the N., attacking in the afternoon, secured and held its objectives and thus eased the situation on that flank. On the evening of Oct. 1 the Canadian line ran from the western suburbs of Cambrai by Tilloy to the Douai–Cambrai railway W. of Blécourt and along that railway to the Sensée.

This was the final day of the Cambrai battle on the First Army front. After its exertions and achievements during the previous five days of incessant fighting the Canadian Corps was in urgent need of rest and refitment. It was therefore decided to postpone further attacks for a few days, until the effect of the Third and Fourth Armies' advance in the S. should make itself felt. The results of the First Army's battle were in any case satisfactory to a degree.

Though Cambrai itself only fell into Allied hands a week later, its fate was in fact sealed by the five days' fighting which has just been narrated. During its course the First Army's line had been advanced close on eight miles; its four divisions had driven back the 13 German divisions engaged by the Seventeenth Army on their front, and taken from them over 7,000 prisoners, 205 guns and 950 machine-guns, besides inflicting losses in killed and wounded which certainly far outweighed their own casualties. The last German fortified system had been breached on this front and the first stage—and the most difficult stage—completed of that triumphant advance which was to lead the First Army, in six weeks' time, back to Mons.

6. *Assault of Third Army on Hindenburg Line* (*Sept. 27–Oct. 2*). The front of the Third Army on the evening of Sept. 26 ran W. of Villers Guislain and Gouzeaucourt, E. of Trescault and Havrincourt to the line of the Canal du Nord S. of Moeuvres and along its W. bank to that village. From right to left along this front were the V. Corps (33rd, 21st and 38th Div. in line), the IV. Corps (5th and 42nd Div. in line, New Zealand Div. in support), the VI. Corps (3rd and Guards Div. in front, 62nd in support) and the XVII. Corps (52nd and 63rd Div. in front, 57th in support). Facing them the German Seventeenth Army held the Hindenburg system with seven divisions in front line.

In view of the great strength of the defences in the southern section of the Third Army zone it was decided that there should at first be no attack by the V. Corps, but that the salient held by the enemy in that area should be left until the progress of the operations on either flank should endanger the garrison's line of retreat. Accordingly the offensive of Sept. 27 was carried out by the Third Army with its three leftmost corps only.

The task of the IV. and VI. Corps was to clear the Hindenburg front and support lines on either side of the Ribécourt valley as far E. as Highland Ridge (running N. from Villers Plouich) and the spur overlooking Marcoing from the west. Five objectives were laid down, and exploitation was to be carried out beyond the final one to Welsh Ridge (N. of La Vacquerie) and the Scheldt canal. The XVII. Corps was first to carry the Hindenburg system on its front and then to advance to the line Graincourt–Anneux, with exploitation if possible as far as Cantaing–Fontaine Notre Dame. Zero hour was at 5:20 A.M.

The 5th Div. of the IV. Corps moving off at that hour early met stubborn resistance and suffered from flanking fire from the south. Beaucamp was not taken till 11:30 A.M. after hard fighting, and then had to be surrendered again late in the evening to a

heavy counter-attack. In consequence the right wing of the 42nd Div. was somewhat checked in its advance, and whereas the left of that division, starting off at 7:52 A.M., was well beyond its third objective by midday the right wing had only just completed the first stage of its advance. By 2:30 P.M. the left of the 42nd in conjunction with the right of the 4th Div. (VI. Corps) had captured Ribécourt, but the final stages of the advance had to be postponed till next morning.

The VI. Corps met with more success. The 3rd Div., overrunning the hostile defences with little difficulty, shortly after midday seized Flesquières and Ribécourt and established itself east of these villages, where the 62nd Div. passed through to continue the advance and carried the line to the outskirts of Marcoing, thus attaining all the corps' objectives for the day. On the left the Guards, despite heavy losses from flanking fire against their left, owing to the fact that the XVII. Corps was unable to keep up with their rapid progress, pressed forward between Flesquières and Graincourt and reached the neighbourhood of Prèmy chapel (N.W. of Marcoing). They were relieved by the 2nd Div. on that evening.

The XVII. Corps had first to clear the W. bank of the Canal du Nord W. of Graincourt before it could attempt to pass it and get forward to its day's objectives. The right division, the 52nd, successfully carried out this operation with a portion of its forces, while other units crossed the canal on the right in conjunction with the 63rd Div., and met with severe resistance. It was not till late in the afternoon that Anneux and Graincourt fell into Allied hands and the 57th Div. passed into first line for the further advance on Cantaing, which proved to be impracticable before nightfall.

On the night of Sept. 27, then, the Third Army front ran from W. of Beaucamp by Ribécourt, Prèmy chapel and Anneux to W. of Fontaine Notre Dame, where it connected with the right of the Canadian Corps—a maximum penetration of some 3½ m. from the jumping-off line. Operations were resumed next day. The IV. Corps began its attack at 2:30 A.M. under cover of darkness; Beaucamp was once more secured, Highland Ridge was carried by storm, and parties pushed forward to Welsh Ridge which was cleared of the enemy by 6 P.M. The VI. Corps, attacking with the 62nd and 2nd Div. as soon as it was light enough to see, cleared the Germans from the W. bank of the Scheldt canal and established itself on the line Marcoing–Noyelles; it was found impossible, however, to get over the canal at the moment. The line of the canal was also reached on the XVII. Corps' front, E. of Cantaing, and her parties succeeded in getting over the obstacle and establishing themselves there despite the counter-attacks of the enemy.

September 29 saw the V. Corps on the Army right joining in the attack in conjunction with the Fourth Army to the south. Little progress was made in this sector, but on all the rest of the front considerable results were achieved. The IV. Corps, advancing with the 5th Div. on the right and the New Zealanders on the left, carried Gonnelieu and Banteux in the right section, securing a bridge-head at Crèvecœur in the left section of its zone of attack. The VI. Corps to its left had passed the canal in force before the end of the day and established itself to the E. of Masnières; the XVII. Corps also got the 63rd Div. over the obstacle, while the 57th Div. on the left cleared the Marcoing line between the canal and the Bapaume–Cambrai road and pushed on to the outskirts of the city itself.

On Sept. 30 and Oct. 1 the advance was continued, but more slowly and with greater difficulty. The Germans, menaced on either flank, as had been foreseen, withdrew from their salient on the V. Corps' front, and the latter were able to get forward to the canal line and commence preparations for forcing it. The IV. Corps secured its footing on the E. bank about Crèvecœur, while the VI. Corps occupied Rumilly after two attempts, and the XVII. Corps on the left flank reached the suburbs of Cambrai on both banks of the Scheldt canal.

The battle on the Third Army front was now over. The Hindenburg line had been breached on a front of nine miles, and an average advance of seven miles effected in the face of the most formidable obstacles, both natural and artificial. Thirteen German divisions had been forced to give ground before 12 British, and had left behind them many prisoners and guns during the five days' fighting. The fate of Cambrai was sealed and only a part of the incompletely constructed Masnières–Beaurevoir line, already broken in its northern sector by the Third Army and in its southern sector by the Fourth Army, was left as a dyke to stem the further British advance. That line, as the attack of Oct. 8 was to show, was destined to prove quite insufficient to hold up those troops who had stormed the immensely powerful defences of the Hindenburg system.

7. *Storming of Hindenburg Line by Fourth Army* (*Sept. 27–Oct. 5*).—The forces at the disposal of the Fourth Army for the attack of the formidable defences of the Hindenburg line on the front of 12 m. from Selency to Vendhuille consisted of the IX. Corps (Braithwaite) (1st and 46th Div. in line, 32nd in support); the composite American-Australian Corps (Monash) (27th and 30th U.S. Div. in line, 5th and 3rd Australian in support, 2nd Australian in reserve); and the III. Corps (Butler) (12th and 58th Div. in line, 18th in support). The IX. Corps' zone of attack included the Canal du Nord and the defences on either side of Bellenglise, while that of the composite corps was the canal tunnel on either side of Bellicourt. The III. Corps had the subsidiary rôle of covering and securing the left flank of the composite corps. The first objective assigned to be captured by the divisions in line included the Hindenburg system on both banks of the canal and the Hindenburg reserve line a mile to the E.; once these had been secured the supporting divisions were to pass through and carry the last line of defence, the Masnières-Beaurevoir line, between the latter village and Le Tronquoy.

The German Second Army, facing the Fourth Army, consisted at this time of the LIV., IV. Reserve and LI. Corps in line, and the XI. Corps in reserve. The III. Corps on the right of the German Eighteenth Army was also partly on the Allied front. Ninety-eight divisions were in line and others in support, but neither physically nor morally were these troops all that could be desired. Moreover, though they must have been well aware that an attack was coming, the date and time were unknown and remained unknown till the moment of the assault.

The preliminary bombardment commenced at 10 P.M. on Sept. 26 and went on for 56 hours; about 1,600 guns of all calibres took part in it, yet so formidable were the hostile defences that the task of the infantry still remained one of great difficulty. This was enhanced by the fact that only in certain sectors where the canal passed under the Bellicourt tunnel was it possible to employ tanks, of which some 130 were allotted to the left of the IX. Corps and to the Composite Corps.

Nevertheless, when the infantry broke forward to the attack at 5:55 A.M. on Sept. 29 under cover of the morning mist their advance made rapid progress.

On the IX. Corps front, while the 6th Div. on the right secured the army flank about Gricourt, the 46th Div. overran all obstacles in its front, swam or crossed the canal, stormed Bellenglise village and the defences beyond, and by 3 P.M. was in possession of its objectives everywhere. At the cost of only 800 casualties it had penetrated some 3½ m. deep into the most formidable part of the hostile fortress, routed the four enemy divisions in its front and taken 4,200 prisoners and 70 guns. It was perhaps the most astonishing single feat of arms in the World War. The 32nd Div. passing through found its task much simplified, and before nightfall had carried the Hindenburg reserve line on practically the whole of its front, taking a further 800 men and 20 guns in its advance.

Farther to the left, however, matters had gone less well on the front of the composite Australian-American Corps. Gallantry and inexperience induced the U.S. Div. in the front line, handicapped from the start owing to confusion in the preliminary assembly of their units, to push too far forward without making sure of the ground in their rear. The supporting Australian divisions therefore found themselves in a difficult situation, which was only redeemed by hard and skilful infantry fighting. On the right of the corps sector the 5th Australian Div. finally

got as far forward as the Hindenburg reserve line about Nauroy; but the 3rd Australian Div. on the left could make little headway from its starting line, and the hostile defences about Bony remained intact.

On the left flank of the army the III. Corps was able to fulfil satisfactorily the subsidiary rôle assigned to it.

Despite the comparative failure of the Composite Corps the attack had on the whole been a brilliant success, seven Allied divisions having defeated nine enemy divisions ensconced in immensely powerful works, capturing from them 5,300 prisoners and 100 guns and effecting such a wide breach in the last German line of defence that its complete capture in a few days was assured.

Gen. Rawlinson decided that the offensive should be continued on the 30th, the U.S. Div. being withdrawn from line for the present. The IX. Corps was to round off its success on the right by clearing the Thorigny area on the near bank of the canal, and occupying the ground on its front as far as the Masnières-Beaurevoir line; the Australians were to secure the remainder of the first day's objectives in its sector between Bellicourt and Vendhuille, while the III. Corps would occupy the latter village to cover their left. The IX. and III. Corps were able to carry out this programme without serious difficulty; but the Australians again met with stubborn resistance, and at the end of the day, though their right division, the 5th, had cleared the greater part of the Hindenburg reserve line, the 3rd Div., on the left, working up the Hindenburg line from the S., had been able to get no farther than S. of Bony. The completion of the operation therefore was deferred till Oct. 1, when the 3rd Australian Div., after fighting all night, succeeded by a combined attack from W. and S. in clearing the Hindenburg line entirely and pushing forward to the edge of Le Catelet. The IX. Corps also had a successful day; the 32nd Div., advancing in conjunction with the 5th Australian Div., cleared Joncourt and Estrées and breached the Masnières-Beaurevoir line on a mile front E. of the former village. This hold was maintained all next day, despite desperate hostile efforts to recover the lost ground; two British attacks on Sequehart were, however, repulsed.

During the first two days of Oct. the army front was redistributed in preparation for the general offensive to be undertaken on the 3rd against the last defensive position left to the enemy—the Masnières-Beaurevoir line. On the evening of the 2nd the line was held by the IX. Corps on the right, with all three divisions, 1st, 32nd and 46th, in front line; the Australian Corps with the 2nd Australian Div. in front line; and the XIII. Corps, with the 50th Div. in line, and the 25th and 66th in support. The orders were for the IX. Corps to take Sequehart and Ramicourt and push forward to Montbréhain; for the Australians to occupy the line from W. of Ramicourt to S.W. of Beaurevoir and then to seize the latter place and Ponchaux; and for the XIII. Corps to clear Gouy and Le Catelet.

Zero hour was at 6:5 A.M. on the 3rd. The IX. Corps on the right had heavy fighting, and after attaining their final objectives about 10:30 A.M. were counter-attacked repeatedly and forced to relinquish Montbréhain and some of the ground gained to the south. The Australian Corps also successfully attained its first objectives, though not till later in the evening, so that the exploitation of their success on this day proved out of the question. The main object of the day's attack had, however, been completely achieved, for along all the front of these two corps the Masnières-Beaurevoir line was in Allied hands. The XIII. Corps on the left established itself in Gouy and Le Catelet by midday, and though a strong hostile counter-attack recovered the former village for a time the ground lost was regained before the nightfall.

After a redistribution of the front the operations were resumed on the 4th. The main task fell to the XIII. Corps, but little progress was made in that sector, as the enemy, who was believed to be preparing for a withdrawal eastwards, resisted stubbornly around Beaurevoir to cover his retirement. The Australian and IX. Corps also had little result to show for their efforts. Oct. 5th, however, saw the successful completion of the programme, the XIII. Corps taking possession of Beaurevoir with the 25th Div. and pushing the 50th Div. on its left wing well north of Gouy towards Aubencheul in conjunction with the right of the Third Army, while the Australians secured Montbréhain. It was to be their last feat of arms in the World War, and they had the satisfaction of knowing, as they left the line on the 6th, that the last fortifications of the Germans on the Fourth Army front had fallen, and that the way was clear into the open country beyond.

During the period between Sept. 29 and Oct. 5 the Fourth Army's 12 divisions had completely defeated 20 enemy divisions, driving them from a succession of defensive lines of unexampled strength and taking from them close on 15,000 prisoners and 120 guns, and could claim for themselves with justice a preponderating share in the decisive victory of the war.

8. *Results of the Battle.*—The results of the battle may be thus summed up: 35 British divisions had been engaged against 79 German divisions. The latter had been forced to retreat some 20 m. on a front of 30, and had lost 67,000 prisoners, 680 guns and vast quantities of other material, besides their killed and wounded. The formidable defensive system on which the German Higher Command, apparently with good reasons, relied to hold up the Allied advance until the winter should give pause to active operations and secure for their hard-driven troops and war-weary people a little respite from their trials and disillusionments, had been burst into fragments, and there was left for German arms no further resource for staving off disaster.

CAMBRIDGE, England (*see* 5.90).—The architectural amenities of the town, as distinct from the university, were increased by the County Hall in Hobson Street (1913), a Wesleyan church at the corner of King Street and Short Street (1913), and a handsome gate-house to the Leys school (1914). A national plant-breeding institute was in course of completion on the Huntingdon Road in 1921.

The University.—In spite of the incidence of the World War, the period 1910 to 1921, viewed as a whole, must rank as one of great activity in the history of Cambridge University. On constitutional proposals of more than ordinary moment, such as those of conferring greater legislative power on resident university and college teachers with the partial disfranchisement of the Senate and the electoral roll (1910 and 1920) or the admission of women to all academic privileges (1920), the university maintained a conservative attitude, but in matters secondary only to these in importance it followed a policy of continuous and thorough-going reform. The courses of study for honours and, more especially, for pass men underwent considerable revision. After prolonged deliberations, Greek, as a compulsory subject, was dropped from, and other noteworthy changes were effected in, the Previous Examination (1919); the regulations governing the pass degree were entirely remodelled (1920); several of the honours examinations, notably the classical tripos and the oriental languages tripos, were reconstituted with a division into two parts, the first of which does not normally carry the B.A. degree with it. New triposes were established in anthropology (1913) and geography (1919), while the mediaeval and modern languages tripos, greatly enlarged in scope, was split into the modern and mediaeval languages tripos and the English tripos (1917). The university further recognized the value of graduate studies by establishing the degrees of Ph.D. (1919), and of M.Litt. and M.Sc. (1920). A series of enactments (1912-4) made several changes in the mode of procedure to the degree of D.D. and threw it open to others than those in Holy Orders of the Church of England.

The increasing diversity of studies resulted also in the establishment of new professorships, readerships and boards of studies; professorships of English Literature (1910), Genetics (1912), Biochemistry (1914), Italian (1919), Naval History (1919), French (1919), Physics (1919), Aeronautical Engineering (1919), and Physical Chemistry (1920); readerships in Spanish, Modern History, Geography, Agriculture, Agricultural Physiology, Physiology, Morphology of Vertebrates, Petrology, Pharmacology, Electrical Meteorology and Estate Management; Special Boards for Architectural Studies (1912) and Psychological Studies (1920). Trinity College offered in 1921 to establish a praelectorship in Geodesy.

Aids to learning and research of a more material nature were provided by the erection and augmentation of numerous institutes. The engineering laboratory on the north side of Downing Street was twice enlarged and finally removed to a completely new site behind Scroope Terrace, Trumpington Road (1920–1). Part of the buildings thereby vacated, as well as new ones erected close to them, were taken over by the neighbouring chemical laboratories. On the south side of Downing Street sites were found for the school of agriculture (1910), the Museum of Archaeology and Ethnology (1910–5), the psychological laboratory (1913), the physiological laboratory (1914), the forestry school (1914), the Molteno Institute of Animal Parasitology (1921) and a low temperature station for research in biochemistry and biophysics (not completed in 1921). The Arts school, off Bene't Street, a fine brick building faced with stone, designed by G. Hubbard, which contains a number of lecture rooms and also houses several departmental libraries, was opened in 1911. In that year the university accepted the Government's proposal to take charge of the solar physics observatory, then at South Kensington, and the necessary accommodation, in close proximity to the existing observatory on the Madingley Road, was completed in 1913. Field laboratories in connexion with the agricultural department, situated on the Milton Road, came into use in 1910–1.

Emmanuel College and Queens' College, to the north of their older buildings in either case, added to their fabric; Cheshunt College found permanent quarters at the west end of Bateman Street (1915), and the chapels of Sidney Sussex and Corpus Christi College were enlarged and redecorated.

Effects of the War.—The immediate effect of the World War on Cambridge University (16,000 *alumni* of which were engaged on active service) was enormously to reduce the numbers of teachers and students. (There were 3,263 undergraduates in the Michaelmas term of 1913, 1,658 in Michaelmas term 1914, 398 in Michaelmas term 1917.) The place of those who had gone was, spatially, taken by professors and students from the Belgian universities, by Serbian school-boys and students, by nurses attached to the First Eastern General hospital (T), first set up in Nevile's Court, Trinity College, in Aug. 1914, and then (1914–9) on the cricket-field of King's and Clare, and, most effectively, by cadet battalions and officers attending staff courses. The absorption of many university teachers by Government departments and the first-hand acquaintance with academic training gained by a still larger number of servants of the Crown greatly advanced the coöperation between university and State, which had already begun practically with Government grants to the schools of agriculture and forestry and to the various departments concerned with the instruction of medical students (1914). The cessation of hostilities did not effect any weakening of this tie: the Admiralty, the Air Ministry and the War Office (on behalf of the Royal Engineers and Signal Corps) organized temporary and permanent training schemes in Cambridge for officers, to afford them immediate acquaintance with the latest developments in the science of their respective callings. When the university, confronted with a serious decline in the value of money and an abnormal number of students (4,363 undergraduates in Michaelmas term 1919, 4,883 in Michaelmas term 1920), was left with the unpleasant alternatives of a serious financial deficit or an equally serious diminution of its educational efficacy, the Government accorded it (1919), as a kind of off-set to the indebtedness it had incurred, a temporary annual grant of £30,000, pending the report of the Royal Commission which had been appointed. (B. W. D.)

CAMERON, JAMES DONALD (1833–1918), American politician (*see* 5.109), died at his country home, Lancaster co., Pa., Aug. 30 1918.

CAMEROON (Fr. *Cameroun*, Ger. *Kamerun; see* 5.110). By the Franco-German agreement of Nov. 4 1911 some 107,200 sq. m. of French Equatorial Africa were added to the German protectorate, while 6,450 sq. m. of Cameroon in the Lake Chad region were ceded to France. An Anglo-German agreement of March 11 1913 settled the frontier of Nigeria and Cameroon between Yola and the Cross river. By the agreement with France the area of Cameroon was increased from about 191,000 sq. m. to 292,000 sq. m. and the pop. from some 2,600,000 to about 3,300,000. In 1913 the white inhabitants numbered 1,871, of whom 1,643 were German.

The additions to Cameroon were "compensation" to Germany for the assumption by France of a protectorate over Morocco (see Africa, *History*). They included two tongues of land running S.E. from the main bulk of the protectorate, one along the valley of the Sanga to its junction with the Congo, the other reaching the Ubangi. Cameroon thus obtained contact with Belgian Congo and full access to the navigable waters of the Congo basin, while the French colony of Middle Congo was cut into fragments. The transfer of territory took place in 1912 and the Germans established military and trading posts both on the Congo and Ubangi. There had been, however, insufficient time to develop the newly acquired territories before the World War put an end to German sovereignty.

Progress was made during 1907–13 in the development of the economic resources of the country, which consisted principally of palm kernels and palm oil, rubber, cocoa, ivory, timber and live stock. Forests cover some 50,000 sq. m. of the country and over 60% of the wood is of commercial value. The plantations of cocoa and rubber largely increased and a beginning was made in coffee-growing. The value of trade, imports and exports, was about £3,000,000 in 1913, compared with £1,700,000 in 1907. Revenue continued to be below the cost of administration, the figures for 1913–4 being: revenue £565,000, expenditure £867,000. Deficits were made good by grants from the German treasury. Some progress was made in railway construction, two main lines being undertaken. The first started from Duala, in the Cameroon estuary and the principal port, and went S.E. by Edea towards the central plateau; the second started from Bonaberi, on the Cameroon estuary opposite Duala, and, skirting Mt. Cameroon, was designed to go N.E. towards Lake Chad. In 1913 a direct cable from Duala to Germany was opened and in 1914 wireless telegraphic stations were erected.

Under Dr. T. Seitz's governorship (1907–10) the administration endeavoured to remedy the worst abuses in native affairs, and revolts became less frequent. The Moslem Fula chiefs in the northern region were patronized and comparatively little interfered with, slavery being continued. Dr. Seitz, on his transference to South-West Africa, was succeeded by Dr. Gleim, who in 1912 gave place to Herr Ebermeier, the last German governor. He was assisted by a council on which sat three nominated representative merchants. The seat of Government was at Buëa, on the slope of Mt. Cameroon.

Cameroon was invaded in Sept. 1914 by British and French (native) troops under the command of Maj.-Gen. Dobell supported by H.M. SS. "Cumberland," "Challenger" and "Dwarf" under the command of Capt. Cyril Fuller, R.N. Duala was shelled and thereupon evacuated, and the last German garrison surrendered in Feb. 1916.

After the conquest of the protectorate the country was provisionally divided into areas administered respectively by French and British authorities. At first the British administered the Duala region, but it and the whole estuary of the Cameroon river was subsequently transferred to French control, the British retaining charge of the port of Victoria, the hill-station at Buëa, and a strip of territory averaging 70 to 80 m. in width from W. to E. flanking the E. boundary of Nigeria. The Supreme Council, sitting in Paris on May 7 1919, gave the mandate for Cameroon to France and Great Britain. By an agreement between those Powers concluded on July 4 1919 Britain finally retained the strip of ex-German territory bordering Nigeria. This British strip included in the south Mt. Cameroon and in the north Dikoa and the adjacent parts of "German" Bornu. The rest of Cameroon, 166,500 sq. m. out of the 191,000 sq. m. of the protectorate as constituted in 1910, fell to France. Those districts which the French had been compelled to cede to Germany in 1911 were reincorporated in French Equatorial Africa and formed no part of the mandated territory. In the mandated area no discrimination in respect to trade could be made in favour of French citizens as against nationals of other states, members of the League of Nations.

During 1920 a provisional boundary was determined by British and French officers who met at various points and this was to remain in force until a commission could be entrusted with the final work of demarcation.

The southern portion of the British area was constituted a province of Nigeria under the administration of a senior resident. The remainder of the territory is incorporated for administrative purposes in the provinces of Muri, Yola and Bornu, to which portions of it adjoin; but in every instance the accounts of the occupied area are kept separate from those of Nigeria in order that detailed accounts showing the revenue collected and the expenditure incurred can at any moment be produced.

Politically the most important additions to territory under British rule are the Emirate of Dikoa, which has been reunited to

Bornu (with which it is closely connected) and a number of small
emirates in the neighbourhood of Yola, which are similarly reunited
to the emirate of that name. Farther south, the districts of Ossi-
dinge, Tinto and Bamenda, which form parts of the Cameroon
Province, are very little developed, but traces are being made for
roads designed to connect them more closely with the neighbour-
ing districts of Nigeria. Buëa, which has an altitude of some 4,000
ft., though it enjoys an almost perfect climate for some four months
of the year, has an excessive rainfall and the humidity resulting
therefrom renders it of little value as a permanent hill-station. It
is connected with Victoria by a light railway which was built to
serve the extensive cocoa and rubber plantations opened and devel-
oped by a number of German companies in its vicinity and in the
country lying between the foot-hills of the Cameroon mountains
and the sea. After the expulsion of the Germans in 1915 these
plantations were kept up and managed by officers employed for
the purpose by the Government of Nigeria; and it was intended
that as soon as a convenient opportunity offered they should be
disposed of by auction, the proceeds being credited to the repara-
tions account. At Victoria the Germans had established a small
but very beautiful and valuable botanical garden which the Gov-
ernment of Nigeria is taking steps to maintain.

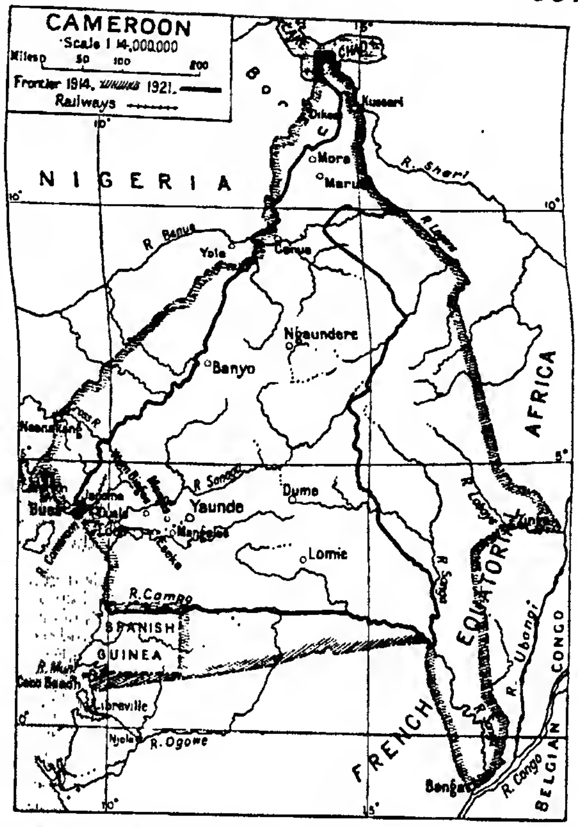
With the exception of the area covered by the plantations, the sphere occupied by the British in the Cameroons is very little developed. Internal means of communication are of the most primitive description; sea communications with Calabar are irregular; the population is not large; and the administration of the area imposes an annually recurring charge upon the Government of Nigeria. In 1921 this amounted to £67,000. It was believed that the mandate for this territory would be issued in 1922.

During 1919–20 the French, who retained the name of Cameroon (in its French form), organized a regular administration. The mandated area was given financial and administrative autonomy, but to ensure unity of policy in common interests the commissioner of Cameroon had the right to a seat on the council of the governor-general of French Equatorial Africa. Cameroon was divided into 12 circonscriptions with Duala (pop. about 18,000) as capital. In May 1921 the capital was transferred to Yaunde—a town of 30,000 inhabitants, occupying a comparatively healthy and central position on the central plateau, and 110 m. S.S.E. of Duala. A route for the extension of the railway from Duala to Yaunde was surveyed. In 1920 railhead was at Eseka, some 45 m. short of Yaunde. The revival of trade after the World War was slow; but in 1920 the combined value of imports and exports was roughly estimated at over £2,000,000.

See I. von Puttkamer, *Gouverneursjahre* (1915); E. Zimmermann, *Neukamerun* (1913); L. Hause, *Durchs unbekannte Kamerun* (1915); A. F. Calvert, *The Cameroons* (1917); G. Bruel, *L'Afrique Equatoriale Française* (1918). A good general map on the scale of 1/2,000,000 was issued by the French colonial ministry in 1920. (F. R. C.)

The Campaign of 1914–8.—On the opening of the World War, Cameroon was invaded independently by such troops—few in number—as the British in Nigeria and the French in Equatorial Africa had at their disposal. The German protectorate was roughly triangular in shape, with its base extending from the estuary of the Muni E. to the valley of the Sanga and its apex reaching Lake Chad; with, in the S.E., two tongues of land running to the Congo and Ubangi rivers respectively. It enclosed on the S.W. Spanish Guinea, Nigeria lay on its N.W., elsewhere it was bordered by French territory. The centre and S. of the country are mostly covered with forest or dense bush; in the E. there is much savannah-like land; the northern part is generally clear of bush, but (save in the immediate neighbourhood of Lake Chad), broken and open, mountainous and with many hill-posts, affording excellent means of defence. The German forces were scattered, but the greater part were about Duala, in the Cameroon estuary, and the chief port.

According to German official statistics the military force in Cameroon in 1913 consisted of 199 Germans and 1,550 natives, and the police force numbering 40 Germans and 1,255 natives. When hostilities began some hundreds of German settlers were enlisted, together with a number of sailors belonging to ships which took refuge in the Cameroon estuary. Considerable numbers of natives were also trained as askaris, and in the N. one or two Fula chiefs, with their levies, aided the Germans. Col. Zimmermann, an able and resolute soldier, was in command. The Germans endeavoured, with scant success, to provoke a *jihad* among the Moslem tribes in northern Cameroon. In general and especially in the coast districts the natives proved hostile to the Germans. As early as Aug. 8 1914 the Germans hanged two members of the principal native family of Duala for treason.



Hostilities opened on Aug. 6 1914, when a small French force captured Bonga, at the Sanga-Congo confluence. The next day Zinga, on the Ubangi, was captured. This prompt action anticipated and prevented an offensive planned by the Germans. The operations were directed by Gen. Aymerich, commander-in-chief in French Equatorial Africa. That officer next formed two columns: one under Col. Hutin advanced N. up the Sanga valley, the other under Col. Morrison advanced W. along the Lobaye, which joins the Ubangi near Zinga. Both columns were at first successful; their objectives were Lomie and Dume respectively, posts in the centre of Cameroon. Almost simultaneously with the opening of Gen. Aymerich's campaign in the S.E., Gen. Largeau[1] in the far N. unsuccessfully attacked the post of Kusseri on the Logone river (Lake Chad region). A second attack, on Sept. 21, was successful. Meantime a British column from Nigeria under Capt. R. W. Fox had crossed the frontier (Aug. 25) and had attacked but failed to capture the hill-fort of Mora which was held by Capt. von Raben. Largeau now sent a French column under Col. Brisset to coöperate with Capt. Fox. On Dec. 12 Brisset occupied Marua, a town S. of Mora, and by that date the whole of the Lake Chad region of Cameroon had been cleared of the Germans except the fort of Mora, where the situation remained unchanged to the close of the campaign. For the most part the British were content to blockade the place, though between Aug. 23 and Sept. 15 1915 unsuccessful attempts were made to storm it. Mora had the advantage of a good water supply.

On the same day (Aug. 25 1914) on which Capt. Fox invaded northern Cameroon, two other British columns[2] invaded Cameroon. One, starting from Yola, attempted to capture Garua (Aug. 30), failed, suffered heavily and was compelled to fall back on Yola. Among the killed was the commander, Lt.-Col. P. Maclear. Reorganized and placed under command of Lt.-Col. Webb Bowen, the Yola column later in the year coöperated with Col. Brisset. The other column, which entered Cameroon in the Cross river district, suffered a severe reverse at Nsanakang on Sept. 6, being surprised by a German force brought from Duala and sustaining 168 casual-

[1] Gen. Largeau (1869–1916) had been a member of the Marchand Expedition to Fashoda and later took a leading part in the conquest and exploration of the central Sudan. It was as commander of the French forces in the Lake Chad region that he directed the French operations in northern Cameroon, later giving Gen. Cunliffe loyal support. In Oct. 1915 he returned to France. He was killed in command of a brigade at Verdun March 26 1916.

[2] The operations on this side were under the direction of Col. Sir F. D. Lugard, governor of Nigeria.

ties. All the Nigerian forces were native troops (under British officers), being drawn from the Nigerian Regt. of the West African Frontier Force. Sir F. D. Lugard had contemplated operations on a larger scale than those carried out, but was called upon to supply contingents for an Anglo-French Expeditionary Force, which it had been decided should be dispatched.

The decision to send an expeditionary force was reached by the British and French military authorities in the first month of the war, and Maj.-Gen. Sir Charles M. Dobell, inspector-general of the W.A.F.F., was chosen for the command. His force, which at the outset numbered 4,300, was composed, in almost equal proportions, of British and French negro troops. The French contingent under Col. Mayer embarked mainly at Dakar, the British at Freetown (Sierra Leone) and other ports, and the expedition sailed for Duala about the middle of September. The many creeks along the coast had already been patrolled by light craft and the Nigeria Marine, while the gunboat "Dwarf" and other boats had anchored off the estuary of the Cameroon. The Germans had mined the estuary and had blocked the fairway. On the arrival of Dobell's transports, escorted by the cruisers "Cumberland," "Challenger" and other vessels, including the French cruiser "Bruix," a passage was forced through the barrier and on Sept. 25 Gen. Dobell summoned the commandant to surrender. On his refusal Duala was bombarded on Sept. 26 and surrendered the next day. Over 400 Germans were found in the port and 30,915 tons of shipping were captured.

Col. Zimmermann had been at Duala from Aug. 4; having decided to conduct the defence of the protectorate from a central position, on the day Duala was bombarded he withdrew by train to Edea, 40 m. to the south-east. The governor, Herr Ebermaier, was already at Edea; there appears to have been close coöperation throughout between the governor and the commander of the forces.

From the coast inland for 150 m. stretches the typical monotonous and almost impenetrable West African forest, fringed seaward by an area of mangrove swamp containing hundreds of creeks. An enemy in this forest could be only a few yards away and still be invisible. Fortunately for the Allies the natives were friendly.

Gen. Dobell at once organized three columns to pursue the enemy through the forest at Edea. One column ascended the Sanaga (not to be confused with the Sanga), and others marched overland. Col. Zimmermann had destroyed the railway in his retreat and at Japoma, where a bridge had spanned a creek 900 yd. wide, a German detachment had been posted. The bridge had been broken but the passage was forced by French infantry with the assistance of light-draught warships and British marines. Opposition to the advance continued the whole way but Edea was occupied on Oct. 26 (1914). But by that time Col. Zimmermann and Herr Ebermaier had retired another 100 m. E. to Yaunde, and the Allied columns were too weak to continue the pursuit. The force stationed at Edea consisted of French troops under Col. Mayer. Yaunde, which had become the German headquarters, was well chosen. It was on high tableland, beyond the bounds of the dense forest, and so situated that Col. Zimmermann could from it maintain communication with the German posts in the E. and N. of the protectorate.

While for lack of sufficient men Col. Mayer was compelled to remain inactive at Edea, Gen. Dobell proceeded to clear the region between the Cameroon estuary and Nigeria. Lt.-Col. A. H. Haywood had charge of the principal operations. By the end of 1914 the whole of the northern railway had been occupied, together with Buëa, the administrative capital on the slopes of Mt. Cameroon.

Meantime practically no progress had been made by the British and French columns in northern Cameroon, while of Gen. Aymerich's columns advancing from the E. that under Col. Morrison had been checked and that under Col. Hutin was making headway. (Hutin, in Oct. 1914, had been joined by a small contingent of Belgian Congo troops, while the Congo administration placed their river steamers and artillery at the disposal of Gen. Aymerich.)

Thus, at the beginning of 1915 the Allied offensive had almost come to a standstill. The forces needed reorganization, coördination and strengthening, and this was now taken in hand. Brig.-Gen. F. H. Cunliffe was appointed to command the British and French troops in northern Cameroon, where the Germans were taking the offensive at various points, and instructed to prosecute the campaign with renewed vigour. Dobell called for reinforcements from the French and British West African colonies, and these were sent, the first fresh troops reaching Duala in Feb. (1915). The previous month (on Jan. 5) Col. Mayer had beaten off an attack made on his force at Edea, the Germans losing heavily in killed and wounded. This was the only offensive action taken by the forces under Col. Zimmermann's direct orders.

All the facts pointed clearly to the main lines of the Allied strategy in the future operations, namely a combined and concentric advance on Yaunde. Meanwhile, to prevent Col. Zimmermann, if he broke S. from Yaunde, from reaching the neutral Spanish territory, a small French column under Col. Miquelard, which had landed at Coco Beach, on the S. shore of the Muni estuary, was advancing along the eastern borders of Spanish Guinea, and another was advancing along the northern border of the Spanish protectorate.

In the result the advance on Yaunde was begun prematurely. It was undertaken as the result of a visit in March 1915 of M. Foureau, lieutenant-governor of the Middle Congo colony, to Gen. Dobell at Duala. M. Foureau asked Dobell to coöperate with Aymerich in an immediate advance on Yaunde. Dobell demurred (the season was late, the rains were beginning and supply difficulties were great) and wished to be assured that Aymerich would be able to coöperate effectively in the vicinity of Yaunde. But his scruples were overcome and he consented to act at once. As events proved Aymerich was far from being able to give effective support. This Gen. Dobell did not know until May 11. In the meanwhile, on April 7 a column under Col. Haywood had moved E. and this enabled Col. Mayer to advance from Edea on May 1. On May 3 Haywood, whose line of march was N. of that of the Mayer column, came to Wum Biagas, a strongly entrenched river position. This Haywood captured after an 18 hours' engagement. Thereafter Col. Mayer took over the command of the two columns, British and French, in the further advance on Yaunde. In all he had about 2,000 men, 300 of whom had been brought from Edea and were fresh.

Gen. Dobell, though he now knew that immediate help from Aymerich was not likely, decided to continue operations. Col. Mayer therefore left Wum Biagas on May 25, but from the first he met with strong opposition. In the dense bush, which sheltered an active and elusive enemy, the rate of progress was no more than a mile a day. Yaunde was still 40 m. distant and dysentery had broken out among the troops. Col. Mayer informed Gen. Dobell that any further advance was impracticable, and received orders to withdraw. This withdrawal was greatly impeded by the Germans, but at a critical moment Mayer was reinforced by some companies which had made a fine march in the tropical rain. By June 28 Mayer was back in the Edea district and the Germans ceased attacking.

While this first advance on Yaunde failed, Gen. Cunliffe in northern Cameroon achieved several successes. He had taken up his command in Feb. 1915, and his first important operation was the reduction of Garua, which was defended by Capt. von Crailsheim (with some 40 Germans and 400 native troops)—a man who won the admiration of his foes for his great daring and skill. Garua was invested in the middle of April and surrendered on June 10, after an unsuccessful sortie. A little later (June 28) Ngaundere (nearly 300 m. N.E. of Yaunde) was occupied and here Gen. Cunliffe paused until Dobell was ready to renew his advance. Part of the interval was occupied in the unsuccessful attempt to take Mora by storm.

The new advance on Yaunde depended on the progress of Gen. Aymerich's columns. Col. Hutin, having been reinforced, occupied Lomie—150 m. S.S.E. of Yaunde—on June 25 1915, after many engagements. He was joined by over 300 German native troops, who had deserted. A month later, July 25, Col. Morrison occupied Dume—140 m. N.N.E. of Yaunde. Morrison had had severe fighting and a chequered experience since he began his march the previous Aug., having more than once been compelled to fall back before enemy counter-attacks. On Aug. 25-6 a conference was held at Duala between Gen. Dobell, Gen. Aymerich and M. Merlin (governor-general of French Equatorial Africa), when arrangements were completed for the final advance. Gen. Dobell renewed his offensive on Sept. 22; Cunliffe moved early in Oct.; Hutin and Morrison steadily pushed on from the east. Dobell had now received considerable reinforcements—his force had reached its greatest strength, 9,700, in November. Cunliffe had from 3,000 to 4,000 men; Aymerich about the same number; the French forces on the Spanish Guinea borders were 800 to 1,000; the Belgian column numbered 600—altogether the maximum Allied strength in the field was about 15,000. Except for a battalion of the Indian Army (sent to Cameroon nearly at the end of the campaign—and as a disciplinary measure) and a battalion of the West India Regt. (negroes) the whole of the rank and file employed were African natives. The German forces, old and newly raised, were estimated at a total of 10,000, including fully 700 white combatants.

For his final operations Gen. Dobell sent forward British and French columns separately—Col. Mayer advancing once more from Edea; the British under Col. Haywood from positions farther north. Again the dense forest was traversed, but now in the dry season and with adequate supply arrangements. The Germans, as before, vigorously opposed both the French and British columns. On Oct. 9 the British retook Wum Biagas, and on Oct. 30 the French took Eseka, the railhead. The British won through the forest first, and by Dec. 17 they were at Mangas, in open country and about 50 m. W. of Yaunde. Four days later the French column, which had had many casualties, was at Mangelas, 20 m. S.E. of Mangas. The British column, acting upon Dobell's instructions, had not waited for Col. Mayer to reach Mangelas, but pushed on straight for Yaunde which was entered, unopposed, on Jan. 1 1916, by Col. E. H. Gorges.

From Dec. 22 German opposition had ceased. Col. Zimmermann, as soon as he knew that both the British and French columns were clear of the forest, and aware too of the approach of Cunliffe and Aymerich, had determined to give up the contest. Together with the governor and 823 other Germans (including civilians), his native troops and thousands of carriers, he evacuated Yaunde, making S.W. for Spanish Guinea, the nearest point of which was, however, 125 m. distant. He was at once pursued, and in a rear-guard action fought on Jan. 8 Col. Haywood released 32 British and French who had been held prisoners by the Germans.

Col. Brisset's column coming from the N.E. was the next to reach Yaunde; then came Aymerich's columns, and Col. Morrison was detached to continue the pursuit of the Germans.

CAMOUFLAGE

Cunliffe's troops had had very stubborn fighting during this closing phase of the campaign, the most difficult operation being the capture (Nov. 4–5) of Banyo, a hill-fortress which lay some 200 m. N. of Yaunde and on the edge of that corner of Cameroon, the region towards the Cross river, where German resistance was continued to the last. In this quarter the Germans continued to offer determined resistance to Cunliffe's forces, and when on Jan. 2 1916 Cunliffe learned that Yaunde had fallen, his advanced troops were still 40 m. distant from that objective.

The efforts made to cut off Col. Zimmermann before he could reach neutral territory failed; the first part of his force entered Spanish Guinea on Feb. 4 and the other detachments quickly followed, and when on Feb. 18 1916 Capt. von Raben and his gallant garrison at Mora surrendered on terms after nearly 18 months' blockade, the conquest of Cameroon was complete.

See the despatches of Sir C. M. Dobell and Gen. Cunliffe in the *London Gazette* (4th supplement) of May 31 1916; *The Times History of the War*, vol. viii., chap. 131 (1916), and *L'Illustration* (Paris, 1916) which gives valuable particulars of Gen. Aymerich's operations. (F. R. C.)

CAMMAERTS, ÉMILE (1878–), Belgian poet, was born at Brussels March 16 1878. In 1908 he settled in England. His earlier works include four volumes of translations of Ruskin into French, and *Les Bellini*, an essay in art criticism; and he has also written two plays, *Les Deux Bossus* (1917) and *La Veillée de Noël* (1917). It is, however, by the poems written during the World War that M. Cammaerts attained his widest popularity. These include *Belgian Poems* (1915); *New Belgian Poems* (1917); and *Messines and other Poems* (1918). He also produced *Through the Iron Bars* (1917), an account of the sufferings of Belgium during the World War.

M. Cammaerts married Tita Brand, a daughter of the singer Madame Marie Brema. Madame Brand-Cammaerts became well known during the World War for her recitations of her husband's patriotic poems. *Après Anvers*, set to music by Sir Edward Elgar under the name of *Carillon*, was one of the great popular successes during the first two years of the World War.

CAMOUFLAGE (from Fr. *camoufler*, to blind or veil; It. *camuffare*, to make up), a French word which came into use, and was adopted into English, at the opening of the World War,[1] to express deceptive concealment, with all that it implies. Its real meaning may be defined as "concealment of the fact that deception is being practised or something being hidden." Deception is an essential ingredient, but concealment (in the sense of "hiding from view") is not. For example, protective colouration in nature does not render an animal invisible but indistinguishable.

Camouflage may be achieved by two distinct methods—(*a*) imitation (simulation), and (*b*) adaptation (dissimulation). The former is exemplified by the replacement of a real tree by a dummy one of exactly similar external appearance—the latter by so treating an object as to cause it to blend with its surroundings. The former is the method most widely employed in land warfare, whereas the latter is more common in nature.

In sea practice, camouflage was adopted during the World War in the form known as "dazzle painting" (*see* below). Bold and fantastic colour patterns were used for the purpose of misleading an observer as to the exact course being pursued by the ship; no attempt was made to render the vessel invisible.

I. "Natural" Camouflage

In the article Colours of Animals (*see* also 6.731 *) the methods of concealment among animals are described and classified from many points of view. It will be convenient, for the purpose of indicating their connexion with artificial camouflage, to separate them into two main divisions, one the method of direct imitation, and the other the method of general inconspicuousness.

Concealment by the first method is effected by the animal imitating some object in its natural surroundings against which it is commonly seen. It is clear that the better the imitation, the more effective the concealment. For instance, the leaf butterfly, *Kallima*, so closely resembles a dead leaf that when resting among dead leaves it can only be located with the greatest difficulty. More often the animal can be found by careful search, but is likely to be overlooked, as, for instance, a tiger crouching amongst dead rushes. In all such cases a direct imitation, more or less exact, is made use of. The application of this principle in land warfare is discussed in section II below. The replacement of real trees by almost exact copies, internally fitted as observation posts, is perhaps the best-known example of camouflage of this class as practised in the World War.

The method of general inconspicuousness may be described under: (1) colour; (2) tone; (3) outline, and (4) modelling and cast shadow. These are the qualities by means of which an object is revealed and thus are those which an animal desiring not to be seen must conceal.

1. *Colour.*—The sandy-coloured desert animal and the green caterpillar are examples of the use of colour to produce general inconspicuousness. Browns, greens and greys, being common background colours, are usually used. Bright colours such as yellows and reds are occasionally made use of, for instance, by insects amongst autumnal foliage. Even before military camouflage had been systematically studied, most armies had adopted inconspicuous field service uniforms.

2. *Tone.*—This is a quality of great importance in camouflage, for the reason that aerial photography was largely used for its detection. In the concealment of animals it is also of considerable importance, though somewhat lost sight of in local colour. An animal which is either darker or lighter than its surroundings will be likely to be revealed in spite of being well coloured. In artificial camouflage it was found that the right tone could be more easily effected by texture than by, for instance, pigment. Thus, the imitation of grass could not be made with green paint on a smooth surface: from one point of view it might simulate well, but from another angle it would reflect a high light (*see* section II below). Roofs of buildings were concealed by covering them with hay, heather and brushwood stuck to the roof with an adhesive paint. The appearance of rough ground so produced could not have been obtained by any kind of painting. But although texture is of so much importance, it must not be thought that local colour can be entirely ignored. The aeroplane photographer used plates sensitive to particular coloured lights or colour filters which had the same effect, namely the detection of any fault in local colouration. The Germans used a green sensitive plate which, no doubt, would have detected a brown camouflage erected on a green field, even if the tone-match had been good. Moreover, the aeroplane carries a human observer as well as the camera.

3. *Outline.*—The production of inconspicuousness by pattern is utilized by animals moving from background to background, which are now seen against foliage and now against brown earth. An animal broadly patterned in green and brown will appear inconspicuous against both these backgrounds and is recognized principally by its characteristic outline or silhouette. Against earth, only the green of the parti-coloured animal will be seen, and this will not have the characteristic shape of the animal, neither will the brown part of the pattern when it is viewed against foliage. The most efficient pattern is one which greatly disrupts the characteristic shape; one, for instance, which breaks out at conspicuous angles or across easily recognized straight lines and curves. Thus, birds commonly exhibit a pattern which divides the head into two, along the line joining the base of the bill with the shape of the neck, and the characteristic straightness of the tail is broken by cross-bars of pattern. A thin, dark or light, line separating the components of the pattern greatly aids its disruptive effect. This method of concealment has been used for guns and other objects, on which patterns of dark green and brown, separated by narrow black lines, were painted in large irregular blotches across the barrel, wheels and limber (*see* section II below).

There are other ways by means of which outline may be concealed. Among birds and insects fringes are sometimes made use of: viewed at a distance, the fringed edge has a blurred appearance causing the object to fade into its background. This principle of the fringed edge was freely and successfully employed in military camouflage, notably in the case of the flat-topped gun covers described in section II. Among insects an edge is often made to appear indistinct by a small marginal pattern of dark and light tone. When viewed at such a distance that the pattern is blended, the edge appears blurred. This is in principle quite different to disruptive patterns, which are only effective as long as they are visible, whereas the marginal patterns are only effective beyond their blending distance.

4. *Modelling and Cast Shadow.*—Modelling is revealed to the eye by the varying amount of light reflected from different parts of the object, and also by the shadow cast upon neighbouring objects. Animals and birds are often toned so as to appear flat by having those parts which are turned towards the light dark in tone; and those away from the light, light in tone. It is common to find the backs of birds dark-brown or black and their breasts white. When

[1] The French word *camouflet*, meaning a small and deep mine which on explosion does not break the surface of the ground, has been in use by military engineers for nearly two centuries.

These figures indicate the volume and page number of the previous article.

viewed in the open, the high light which is reflected from the back is subdued by the dark feathers; whilst the darkness of the under parts is partially neutralized by the white breast feathers. The whole bird will thus appear evenly toned like a flat object and for this reason will be inconspicuous.

This method, called counter-shading, was occasionally made use of in military camouflage.

As regards the concealment of cast shadow, the only method employed by animals is to avoid them. Insects will turn and face the sun so that their closed wings will only throw a line shadow on the ground: others will tilt their wings parallel with the ground, thereby hiding the shadow which they cast. In military camouflage on the other hand the difficulty had to be faced, and an ingenious and successful method was evolved in the case of the flat-top gun cover. The cover consisted of wire or fish netting, on which strips of canvas were threaded and knotted. These strips were coloured green or brown in imitation of grass or earth. By gradually thinning out the knots at the edge, the shadow of the thickly knotted centre was hidden by the sparsely knotted margins which themselves cast little or no shadow.

The above outline will suffice to give a general idea of the relation between animal colouration and camouflage. But it should be added that the camoufleur has much greater difficulties to contend with than has the animal on account of the extremely accurate and systematic observations made by the enemy with the eye from forward observation posts and kite balloons, and with the camera from aeroplanes. (J. C. Mo.)

II. Military Camouflage

The word "Camouflage," in the broad sense of military deception, is applicable to all stratagems designed to mislead the enemy. In the following account it is used in the restricted sense of "deception practised through the agency of artists."

The application to war of camouflage, as thus defined, is by no means novel; dummy guns have been successfully employed to mislead an opponent on occasion ever since guns became a normal part of military equipment. Washington Irving in his *Conquest of Granada* records an instance in which the ruined wall of a blockaded town was repaired, without attracting the enemy's attention, under cover of a cloth screen painted to resemble a battlemented wall (*circa* 1484). The Venetians are reputed on one occasion to have imposed terms of peace on Ragusa by the expedient of building a threatening fort of cardboard in a position commanding the town. And when Henry VIII. of England besieged Tournai in 1513, the defenders used lengths of canvas, painted to resemble trenchwork, to mislead the besiegers as to the extent of the defences. Other instances could no doubt be brought forward in which camouflage was practised by individuals as an expedient. But it was not till the World War that it was practised by armies as a policy.

A transitional stage between the spasmodic use of camouflage in emergencies and its regular and systematic use as in the present day is marked by the painting, or other treatment, of coast defence forts to blend with their surroundings, in order to render them less conspicuous from the sea, *e.g.* Cork harbour, Isle of Wight, Singapore.

The well-known chequered black-and-white of the Spithead forts was an attempt to mislead the enemy as to the exact location of the gun embrasures. The same artifice was used in the case of the loopholes of blockhouses in the South African War of 1899–1902.

A further stage was reached in the adoption of uniforms coloured to blend with the usual or typical colours of the countryside in a theatre of war. The first of these was the Indian *Khaki* (*see* 15.770), and after the experience gained in the South African War, when the importance of concealment came into great prominence, the British and most other armies soon adopted dust-coloured, light-blue, grey, or grey-green uniforms.

Shortly after the South African War, experiments in the disruptive painting of guns were undertaken, but the system was not adopted, and no further development in the practice of camouflage took place until the war of movement of 1914 gave place to trench warfare. Hitherto deception in war had been limited to the comparatively simple task of deceiving the human eye, at a considerable distance, and for a short time. In the World War its rôle was extended to circumventing the camera, in addition to deceiving for long periods, the eyes of observers armed with powerful glasses. For the first time in history, a military unit was organized for the definite purpose of practising scientific deception.

This policy was initiated by certain French artists serving in a French battery towards the end of 1914. The interest of a French army commander was aroused and his sympathy enlisted, with the result that a "Section de Camouflage" was formed early in 1915 for the purpose of assisting units in the concealment of battery positions and other military works, and the construction of concealed posts of observation. The success attained by this section led to the organization of the British Camouflage Service as a unit of Royal Engineers, early in 1916.

The need for organized camouflage is directly attributable to two novel features of the war, firstly the prolonged period of stationary warfare; and secondly, as an outcome of the first, the rapid development of aviation generally and of photography from the air in particular. Stationary warfare entailed the prolonged occupation of definite localities by troops, guns, and other numerous appurtenances of war, whose installation tended to become semi-permanent instead of temporary. It was therefore possible for each opponent methodically to examine the other's battle area in detail, and at comparative leisure, instead of relying on promiscuous and hurried reconnaissance, as in the past. It was soon recognized that photography provided the best means of executing such detailed examination, and presently the art of interpreting air photographs almost reached the level of an exact science. The information thus obtained far exceeded in quantity and accuracy that gleaned by observers, who could not but be distracted by the expanse of the view beneath them and the incidents of their adventurous journeys. All the resources of science were therefore devoted to the production of lenses, plates and colour screens, specially adapted to the needs of military intelligence. This evolution in the means of obtaining information necessarily called for a similar evolution in the means and methods of denying it, and a special service was organized for the study and practice of the science of camouflage.

The taking, developing and study of photographs demands a certain amount of time and special appliances, and still more so does the study, production, and application of camouflage, of which the progressive stages are performed on foot, in a large well-equipped factory, and in slow-moving lorries and trains. As long, therefore, as a condition of stationary warfare obtains, the maintenance of a special organization to practise camouflage is both necessary and possible.

But the conditions of a war of movement are quite different. Installations and constructions of all kinds are few. The occupation of localities by troops and guns is fleeting, and, in consequence, the camera loses its specialized usefulness. It follows, therefore, that the elaborate concealment of gun positions or other works is no longer necessary. Nor is it possible, for the transport, on which the camouflage service relies, is engaged to its utmost capacity in conveying the vital necessities of war, *i.e.* food and ammunition; and at the same time the factories, on which the supply of the material of camouflage depends, are being left farther and farther in the rear—or being engulfed by the advancing enemy, as the case may be.

The case may be summed up thus:[1] when accurate means of locating positions are employed, expert methods of concealment become essential; when the converse obtains, extempore methods suffice, though some form of portable camouflage, designed for use in moving warfare, and carried as part of their normal equipment by fighting troops, would be preferable.

[1] There is ample evidence to prove that the Central Powers took no steps to organize a camouflage service till late in the war, though extempore methods of concealment were universal. Captured documents bear few allusions to the subject until after the battle of Cambrai in Nov. 1917. In the great offensive of March 1918, the Germans captured many specimens of camouflage together with pamphlets on the subject which they translated and distributed to all formations; at the same time arrangements were made for the quantity production of materials for concealing gun positions. In the Entente offensive of autumn 1918 many specimens of this material were captured for the first time, together with numerous examples of instructions on the practice of camouflage.

The principles and practice of camouflage may be dealt with under three heads: (1) the concealment of gun positions and the like from the enemy's aeroplanes ("air observation"); (2) the concealment of observation posts and machine-gun emplacements from direct view ("direct observation"); and (3) miscellaneous applications of camouflage.

(1) *Camouflage against "Air Observation."* The purpose of camouflage is to render objects indistinguishable, or un-

recognisable, by means of imitation or disguise. Concealment in the limited sense of "hiding from view" is not the primary aim. The ideal is non-interference with the natural, or normal, aspect of the locality, as viewed from the air, with which the enemy has become familiar. This is an ideal which can only be reached by close attention to detail, and by the exercise of forethought and imagination. Preliminary study of an aeroplane photograph of the locality will enable the effects of preparatory work, and subsequent active occupation, to be foreseen, and consequently make it easier to plan methods of combating them. These methods must be put into force before commencing work. To do so afterwards is futile, unless it is certain that no observation from the air has been possible during the progress of work. The processes of successful camouflage are closely analogous to those of successful crime—namely, preliminary reconnaissance, suppression of clues, provision of false clues, variety of method and concealment of the crime itself.

In the following study of the principles of camouflage the subject is dealt with in relation to the concealment of gun positions. In practice many other works were also concealed, such as machine-gun emplacements, defences, dumps, mine spoil, gas projector installations; but similar problems are encountered in all these cases.

Gun positions can be located by (*a*) aeroplane photography, (*b*) air observation, (*c*) flash spotting, (*d*) sound ranging. The two last furnish certain limited information. Beyond screening flashes, no method of frustrating them has yet been evolved. The manifest remedy (failing a silent, flashless propellant) is the skilful employment of dummy flashes and synchronized reports. But it is principally by means of photographs taken from the air that positions are definitely located on a map. The chief opponent to be overcome, therefore, is the expert, who, with the advantages of time and undisturbed concentration, which are lacking to the aeroplane observer, is able to interpret what is recorded on photographs. The aeroplane observer cannot, however, be altogether disregarded, and, although the main efforts must be directed towards defeating the air photograph expert, it must be done in such a way as not to draw the attention of the observer.

The camera is a most accurate witness, and a photograph will always record something. The art of camouflage lies in conveying a misleading impression as to what that something signifies. The photograph records colours and accidents of ground (such as bare earth, vegetation, woods, etc.) in terms of light and shade, and is a patchwork or pattern of black and white meeting in varying intensities of grey. The pattern may be large and simple like that on a chess-board, or intricate and confused like that on a painter's palette. A cultivated district presents a regular chess-board pattern, with large rectangular expanses of monotone, the only accidents to break the monotony being occasional hedges, banks, or houses, with their attendant shadows. Broken ground, such as demolished villages, shelled areas, or patchy vegetation, presents a highly complex pattern, full of merging lights and shades.

Photographically, the effect of colour is not so marked or important as the effect of light and shade. Earth is towards the white end of the scale, and grass or vegetation towards the black—not because of their respective colours but ***on account of the amount of contained shadow or " texture."***

A billiard-table or top-hat illustrates this quality. Brush them the wrong way, against the nap, and their tone is lowered to dark green in the one case, and dead black in the other; brushed the right way they appear very noticeably lighter in tone. The reason is that they gain " texture " when brushed the wrong way, and lose texture when brushed the right way. In other words, they absorb light in the former case, and reflect light in the latter. Nap is constituted of countless slender hairs, each one throwing a shadow when erect, but casting little when flat. Grass, or vegetation, possesses this same property to a marked degree. The longer it is the darker it appears on a photograph; but when it is pressed down, the amount of shadow thrown is lessened, and consequently it appears lighter. Hence the obviousness, on a photograph, of a slightly worn track in grass which is scarcely noticeable when viewed from the ground. Earth, on the contrary, contains little texture, and the longer it has been turned up and exposed to rain and sun, the less it contains. A beaten track is, however, conspicuous as it contains no texture at all, and will therefore reflect more light.

The reason for the mottled effect, in a photograph, of a patchy mixture of grass and earth, which blend imperceptibly into each other, is therefore evident. The appearance of snow can be divined from the foregoing. Contrasts in tone are much accentuated, and the effects of shadows are more marked, partly owing to the fact that snow usually falls at a time of year when the sun's path in the sky is low.

It is essential, when judging the colours of a locality, to view it vertically, and not obliquely as one is accustomed to see a flower bed. A field of young corn, surveyed from the ground, appears green, but from above, probably the earth only is seen, darker in tone than the normal, owing to the shadows cast by the young blades of corn. Similarly, with a field of ripe corn the actual light tone of the straw and ear will be somewhat darkened by their shadows.

It is of the first importance to grasp this principle of regarding any locality purely from the point of view of the pattern it will present on a photograph. Therefore, the most practical method of planning the concealment of any work is to plan it with reference to a recent photograph which records the ground pattern, and the natural facilities for concealment which exist in the locality. Such facilities abound in a neighbourhood whose photographic pattern is complex, and become less frequent as the pattern becomes less complex. Any slight error in exact reproduction may escape notice in the prevailing complexity, because detection depends on comparison, and comparison is rendered perplexing by the very intricacy of the pattern; the difficulty is enhanced by the variations present in successive photographs of the same place, due to dissimilar conditions of light. A simple analogy is the comparative visibility of an ink stain on a patchwork hearthrug and on a table-cloth.

There are certain characteristic clues which will always betray new work to the reader of aerial photographs. They are: (*a*) disturbance of soil; (*b*) tracks; (*c*) shadows; (*d*) regularity; (*e*) blast marks of guns. To achieve success, these clues must be suppressed from the very beginning. Or if deception is to be achieved by the use of dummies, these clues must be supplied.

The prolonged duration of the period of trench warfare was responsible for the introduction of many new methods of waging war scientifically. Among these was the systematic study of the enemy's normal activities, as gauged by observation over a long period, to determine such things as average intensity of gunfire, movements behind the lines, density of traffic, number of hospitals, size of dumps, etc. The chief evidence was obtained from photographs, taken at regular intervals, of the whole enemy front to a depth of several miles. Comparative analysis of this photographic diary revealed departures from the normal from which deductions could be made. It was therefore of the utmost importance to preserve an appearance of " normality."

Clues (*a*), (*b*) and (*e*) call for no special comment, but some further explanation may be added in the case of shadows and regularity.

Shadows.—The form of any erection, or excavation, is revealed in a photograph by the shape of the shadow cast. Two intersecting planes, *e.g.* the two sides of the roof of a building, will show differently on the photograph (except for a very brief period every day) because they receive light at different angles, and therefore reflect it differently. It follows that an artificial reproduction of locality must be erected parallel to the contours of that locality, or in other words the planes of the imitation and the real must not intersect. A mound must be imitated by a mound, and a flat surface by a flat surface. Any departure from this principle is most easily detected in a photograph taken when the sun is low, the shadows being long in consequence.

Regularity.—No shape in nature is of regular outline; consequently anything of a regular shape in a photograph invites scrutiny because it must be the work of human hands. In a battery position, regularity is usually displayed in the geometric shape of the gun-pit, and the regular spacing and alignment of the guns.

It is now possible to sum up the theoretical conditions which govern the concealment of gun positions, and other works, from the enemy in the air:—

(*a*) The material of which the camouflage is composed must at all times appear on the photograph like the object or surface it represents, and likewise appear natural to the observer's eye. *Quâ* material, it must be light, strong, impervious to weather, fire-proof and easily manufactured. (*b*) Disturbances of soil, tracks, shadows, blast-marks and regularity must never appear to be associated with an active gun position or occupied work.

Practical Application.—We come now to the application of these principles. In the early part of the World War air photography was not the highly specialized art it subsequently became, and therefore the difficulties of combating it were not so great. At first, freshly cut branches and grass were used, being the materials nearest to hand. These withered in the course of a few days and ceased to be efficacious. The next stage was the employment of sheets of canvas painted to represent the ground. The design was bold, and consisted of large masses of green, or brown and green as the case might be, with heavy black shadings, to give the effect of texture. These covers were draped over the guns and came down to the ground on every side, being removed when the gun was in action and replaced immediately afterwards. This system also proved unsatisfactory. It is nearly impossible to reproduce on a smooth sheet of canvas the changing tones of the ground as recorded by the camera. Under certain conditions—*i.e.* when the angle of light incidence is small, or after rain—painted canvas, having no texture, reflects so much light that all trace of pattern or colour is lost.

Then came the introduction of fish netting. At first these nets were garnished sparsely with bunches of painted raffia (gardeners' bast). The effect was excellent; the nets were light and portable; but the inflammability of the painted raffia was a grave disadvantage. Efforts made to dye the raffia and to render it fire-proof proved fruitless. The dyes, especially green, were too fugitive, and no method of rendering the raffia permanently fire-proof could be discovered. Strips of painted canvas, instead of raffia, proved more satisfactory from the manufacturing point of view, but these also suffered from the defect of inflammability,[1] though in a lesser degree. The final evolution of the gun cover was a net having an opaque centre of painted scrim,[2] the shape of which was boldly irregular, with a border of painted canvas strips decreasing in density towards the edges, erected horizontally, like a carpet, over the work and much larger in area than the work itself (see fig. 3). Thus, the excavation was concealed by the opaque centre, the shadow of which was blurred or masked by the border of strips which, in themselves, were not sufficiently dense to cast a shadow. If skilfully erected and maintained such covers were satisfactory. Installed before any work of excavation was started, subsequent construction and occupation remained concealed. Guns could be treated individually or collectively by increasing the area covered. Figs. 1 and 2 show the treatment of a battery position placed under the edge of a bank. The false edge of the "bank" should be noted.

The use of netting was practically confined to works whose nature demanded covers erected at a considerable height above ground level. Scrim was used, by itself, to conceal objects near, or on, the ground, such as short lengths of trench, ammunition, gas-projectors; it should always be reënforced by natural material to increase its texture effect. Further, this material must always be cut or assembled in large fantastic shapes, in order to appear natural, and to allow its edges to merge gradually into its surroundings.

Many gun positions, which had defied all attempts at location, were betrayed by *snow*, particularly in respect of blast marks, because the flash of discharge melts the snow over a large area immediately in front of the gun. Further, shadows were accentuated, and the normal method of combating shadows, by the adoption of thinned edges, proved fatal in snow, as such nets did not hold the snow and consequently appeared as black holes in a sheet of white. White calico proved a palliative, especially in the case of blast marks, if boldly irregular in shape.

[1] A solution of this problem of fire-proofing canvas was in sight when the Armistice put an end to its urgency.

[2] A kind of loosely woven canvas whose meshes give the effect of texture by absorbing light.

Evidence afforded by *tracks* is perhaps the most difficult of all to eliminate. Frequently positions, which are admirably concealed in every other way, are betrayed by the tracks leading up to them, so much so, that it is often possible to count the number of guns in a battery by the paths leading to each gun-pit and to distinguish between gun positions and other works. It is comparatively easy to plan the approach so that it may be concealed naturally or artificially; the difficulty is to ensure that this and no other route is used—human nature being so strongly addicted to taking short cuts, barbed wire and discipline seem to be the only means of preventing it.

The following afford good illustrations of methods of concealing approaches that have been adopted with success: (*a*) Leading the track close past the gun position and on to join an existing track. The connexion to each pit being treated with camouflage material or cut grass, etc., etc. (*b*) Similarly, but close in front of the gun-pits in order to use the track to hide blast marks. This method has the disadvantage of restricting traffic while the guns are in action. (*c*) Siting a battery in the midst of an existing network of tracks, taking precautions to reproduce on the camouflage any path interrupted by a gun-pit.

It is not practicable to conceal long *trenches*. If a covering sags or differs materially in tone from its surroundings the mere length and regularity will betray it. A covering, originally perfect, will require continual attention to keep it perfect, involving labour out of all proportion to its value. Short lengths of trench can be concealed, provided care is taken to support the camouflage adequately to prevent sag, and to conceal the spoil.

This applies equally to trench systems prepared far behind the lines for use in the event of a retirement. It is probable that the enemy, foreseeing the construction of such a defensive line, will be able to guess the approximate positions of such systems, and he is certain to have periodically photographed the suspected area. It is quite impossible to prevent some traces of work being evident in a long and deep system of defences. Camouflage must obviously be restricted to vital spots, and extreme care must be exercised

(2) *Camouflage against Direct Observation.*—The concealment of *observation posts* was comparatively simple, being merely an adaptation of the craft of theatrical property-making. Natural features were selected, in places from which good observation could be obtained, and these were copied exactly. At night, the real was removed and replaced by the imitation. A large variety of objects were so copied among which may be mentioned:—trees, sand-bags, milestones, mounds of earth, chimney-stacks, walls. In all cases the copy was a thin outer shell containing a bullet-proof lining in order to give confidence to the occupier. The loopholes, when subject to scrutiny at short range, could be made quite invisible by the use of gauze, which, though painted to resemble the exterior of the O.P., remained transparent from the inside. This method was only adopted when absolutely necessary, because gauze interferes with vision—especially through glasses; in other cases care was taken to give the loophole an irregular shape.

Certain conditions were found to govern the successful employment of these observation posts, particularly in the case of the more elaborate examples such as trees.

a. Concealed access is essential.
b. The work connected with installation must, like other work, be concealed from the air.
c. They should not be erected in places that are normally subject to heavy shelling, for the reason that careful observation will be prejudiced and accidental damage will probably reveal the observation post to the enemy.
d. Provision must always be made to prevent daylight showing behind the loophole, so rendering it transparent to the enemy.
e. The comfort and security of the observer must always be studied, otherwise the full value of the observation will never be obtained.

Imitation trees (see fig. 6) were designed either to accommodate an observer at a commanding height above the ground, or to conceal a long periscope, the user of which was protected in a strong dug-out. In the former case the observer had a better view, but was uncomfortably cramped. The periscope is limited

in respect of magnification, field of view, and clearness of vision, in proportion to its length. On the other hand advantage may be taken of its length to obtain high command with comparative security, or increased security with low command. Further, with suitable mountings, it can be used as an instrument of precision in conjunction with map and compass. Provision should always be made to give bullet-proof protection to the periscope when in use, and to allow of its being lowered for cleaning and safety when not in use.

It was sometimes necessary to construct *machine-gun emplacements* for defence in positions that either were, or might be, exposed to direct view. In certain cases the emplacement was incorporated in some existing ruin, parapet, or such-like protection, where it was only necessary to conceal the embrasure. This was effected by the use of gauze painted to resemble the exterior, either in a hinged frame which could be removed for action, or fixed and fired through when need arose.

In other cases the emplacement was in the open. In such circumstances full precautions had to be taken to guard against detection by the camera also. An additional danger lay in the risk of detection from low-flying aeroplanes. To meet this a movable cover was evolved, in the nature of a lid, suitably disguised to resemble the surroundings (see figs. 4 and 5). Normally this lid reposed on the top of the emplacement, overlapping it considerably; in action the lid could be raised vertically a foot or two, still affording protection against view from overhead, and also, to a partial extent, against long-distance direct view.

As a general rule, the *screening of roads* from observation by the enemy is not in the province of camouflage, in that no deception is attempted, the main object being to conceal traffic from direct view.

In a few instances true camouflage was practised when a screen painted to represent the enemy's accustomed view of the locality was erected between the road and the enemy, so that the road would always appear unused even while traffic was passing behind the screen. Such an expedient was restricted to a few favourable places, such as occasional gaps in a road otherwise entirely hidden from view, or open spaces in a village where the ruins for the most part obstructed the enemy's vision. These screens were impracticable in cases where the portions to be concealed exceeded a few yards in length, as they were exposed to the weather and casual shelling, and therefore had to be very strongly constructed. This, combined with the necessity of complete erection at night and the fact that they could be used only where the locality was not subject to marked seasonal changes, considerably limited their use.

(3) *Miscellaneous Applications of Camouflage.*—It was only natural that, after a camouflage unit had been organized, with skilled personnel and well-equipped workshops, there was a wide field for the display of ingenuity. For the most part the field has been covered in the foregoing sections dealing with the methods of combating air and ground observation, but it will be of interest to give a short description of devices that fall outside these two categories.

Dummy Attacks.—In 1917 the practice of raiding the enemy trenches increased in frequency and scale, and in order to secure the best results with the least expenditure of life, dummy attacks were frequently staged on the flanks of the real front of attack, and set in motion a few moments before it. The dummy (or "chinese" as it was called) attack consisted of numbers of life-sized silhouette figures, made of stout millboard and painted to resemble the various postures of advancing troops. These figures were placed in scattered groups of ten, and suitable arrangements made to raise and lower them at will from some place of safety, so that they simulated waves of advancing troops (see fig. 7). In the early light of dawn, or partially obscured by smoke, they were very realistic, but success depends on skilful operation of the figures rather than on the painting. Directly the enemy's fire was drawn the real attack was launched with the comforting knowledge that many precious moments must elapse before the enemy could switch his fire off the dummy attack on to the real attack.

Similarly, the location of enemy snipers was facilitated by the use of *dummy heads* made of papier-mâché. These were exposed over the parapet, in a life-like manner, in order to draw the fire of an enemy sniper. If the head was hit, it was possible to locate the exact position of the sniper by producing the alignment of the holes of entry and exit of the bullet. It was necessary to paint these heads with a matt surface, darker in tone than the natural, in order to imitate the texture of the human face.

Sniper Suits.—The concealment of snipers and scouts was facilitated by the wearing of costumes painted to match the surroundings. When garnished with local vegetation, and used skilfully, it was extremely difficult to discover the wearer. Fig. 8 shows an exceptionally tall man lying quite in the open, but wearing a sniper's robe. Fig. 9 shows, in contrast, two men firing from behind a turnip heap, the one wearing the ordinary uniform cap and the other a sniper's robe suitably garnished. In each case the photographs were taken at a distance of only 8 yds.

Disruptive painting, as a method of reducing visibility, has been alluded to in an earlier section of this article. Its simplicity makes a strong appeal to the imagination, and a large number of objects, including guns, were so treated. The colours employed were green, cream and brown, isolated from each other by thick black lines. The principle is that one or more of these colours is capable of merging into any surroundings, leaving the visible remainder as a number of detached patches of colour, thus breaking up the form of the object into a number of dissociated pieces. The contrasts in colour must be marked, and the patches large enough to be distinct when viewed from the appropriate distance; otherwise the colours will blend and, in consequence, the disruptive effect will be lost. An effect of texture is also essential to prevent reflection. In the case of guns, it was soon found that the wear and tear of active service caused the colours to lose their contrast and, consequently, their disruptive effect. The system was therefore abandoned.

In the case of large buildings and camps, the disruptive effect is nullified by their mass, heavy shadows and quite inevitable regularity of lay-out.

Camouflage Material and Its Production.—By no means the least difficult part of the whole problem of camouflage was that of producing the material in sufficient quantities to meet the enormous demands. At first each position was treated individually as a separate problem, but it was very soon obvious that although this principle was desirable it was quite impossible, in view of the number of positions to be dealt with. It was evident that a system of standardization was imperative, in conjunction with some method of adapting the general to the particular. Standardized manufacture was therefore adopted. It was recognized that in certain cases standardization could not be applied; but experience showed that the proportion of such cases was small. In all cases the material was capable of some degree of adaptation to local conditions.

For gun positions, etc., three distinct media were furnished—fish nets, wire netting and scrim.

Fish Nets.—The nets themselves were supplied from England. The size, 30 ft. by 30 ft., was fixed as being the minimum suitable for universal application; one or more nets could be easily joined if necessary. The nets were woven "square" in contradistinction to "diagonal," because the diagonal net closes when extended, *cf.* the principle of "lazy tongs." The meshes were 2½ in. square. The outside was bound with strong cord to take the tension, and the whole was treated with a non-inflammable preservative. The garnishing of these nets has already been described. The nets were commonly used for all types of guns and were in demand because of their comparative portability.

Wire Netting was used in large quantities also, being stronger than fish netting, though less portable. For convenience in handling it was made up in rolls 30 ft. long, averaging 6 ft. wide, and was garnished in a fashion similar to fish netting, except that the thinning process could only be applied to the ends. In the field these rolls were joined up to suit the work they were intended to cover, and the thinning-out process was completed on the site.

Scrim, as already mentioned, by itself was mainly used on or near the ground and was issued in 30 ft. by 6 ft. rolls for a variety of purposes. Towards the end of the war, when night bombing became very persistent, scrim was used to cover aeroplane hangars (whose light-coloured roofs were very conspicuous at night), until coloured covers became the normal equipment of a hangar.

Colouration.—In these three types four standard colourations were adopted, suited respectively to areas where the predominant conditions were: all vegetation, all earth, partly earth and mostly vegetation, partly vegetation and mostly earth. Both the scrim centres and the borders of strips were coloured in this way.

Observation Posts, etc.—Standardization of the exteriors of observation posts was not possible for obvious reasons, but the principle was applied to the bullet-proof interiors and other component parts. They were classified as: observer trees, periscope trees, parapets (sandbag or earth), portable O.P.'s. In addition there were many

special situations provided for. Other standardized articles were: dummy attack figures, dummy heads, snipers' suits and portable covers for machine-guns—these last-named reversible squares of scrim 8 ft. by 8 ft., green on one side, brown on the other; made very light and portable for use in the field.

Manufacture.—Although a description of the methods of production is beyond the scope of this article, discussion of the principles and practice of camouflage would not be complete without some reference to the important part played by materials, particularly canvas and paint.

Canvas is not an ideal material, being very susceptible to damage by weather, but it is easy to manipulate and is cheap. From the point of view of appearance, it is inferior to *raffia*, which, however, suffers from the hitherto insuperable disadvantage of inflammability. "*Water*" *paints* were generally employed for canvas for the reason that oil paints, which are more durable, are too inflammable, even to the extent of spontaneous combustion. This latter disability was the cause of disastrous fires where rolls of painted canvas were stored. Green *dye* proved too fugitive, but brown dyes proved satisfactory. Generally speaking, canvas and paint do not adequately fulfil the conditions of lightness and durability.

(F. J. C. W.)

III. Naval Camouflage

The painting of vessels of war with a view to reducing their visibility and so adding to their fighting value is by no means a modern development. The Romans are known to have painted their galleys; "seven kinds of paint were used, viz. purple, violet, yellow, two kinds of white, and green for pirates in order that their resemblance to the colour of the waves might make them less conspicuous."

Camouflage on various lines but with the invariable idea of reducing visibility had been attempted in the British navy for many years before the World War. None of these schemes had met with any success, and each in turn had been abandoned after furtive trials. The two factors which led to this abandonment were first the failure to realize that anything in the nature of invisibility at sea is possible of attainment, and secondly the inability of the proposers of these schemes to provide definite instructions of a practical nature by which vessels could be painted with some degree of consistency.

The Board of Admiralty eventually adopted a partial form of camouflage by painting all vessels a light grey as opposed to the black hulls and light upper works previously in force. But even this simplest form of all protective measures was somewhat haphazard in application, since the individual vessels of a squadron varied considerably in colour, ranging from a light bluish grey to a dark slate according to the ideas of the commander.

It was not until 1917, during the height of the submarine peril, that a practical scheme having a definite end in view and formulated on scientific lines was put forward and officially adopted by the British authorities. This scheme embodied entirely new ideas on sea camouflage, and was rescued from the early disease which had attended all its predecessors by the fact that the proposer was able to supply designs to scale in large numbers, all bearing out a central idea. It was called for distinction's sake in official documents "Dazzle Painting." The sole object of dazzle painting was so to distort the normal appearance of a vessel that her actual course became a matter of doubt in the mind of a submarine officer, the estimation of a vessel's true course being the prime factor required to ensure successful attack.

Dazzle painting was intended primarily for application to merchant ships. These vessels were in far greater need of protection than warships owing to their slow speed and vulnerability and also from the fact that the enemy were making a concerted attack on England's supplies of food and materials essential to the conduct of the World War.

Warships as a rule possessed high speed and were moreover protected by destroyers, a type of vessel which while being the most deadly opponent of the submarine was comparatively immune from attack. A certain number of war-vessels were however dazzle-painted. These were chiefly ships engaged on convoy work, although a certain number detailed for special duties such as mine-laying and patrol service found this special form of protection of valuable assistance.

At first sight it would appear impossible to treat a vessel with paint in such a way that an experienced seaman could be deceived as to her actual course, but dazzle-painted ships proved that this could be done. Juxtaposition of violently contrasting colours, black and white predominating, combined in accordance with the laws of perspective, could make it extremely difficult to judge the accurate inclination of a vessel even at a short distance.

In the early stages of dazzle painting a large range of colours was employed to achieve the end in view. Experience showed that this could be attained by a much smaller number, and towards the end of the war the principal colours in use were black, white, and blue, these being employed in varying intensity.

Another factor which led to the simplification of the colours used was the knowledge that the German naval authorities had introduced the use of colour screens in their submarine periscopes with a view to reducing the camouflaged ship to a silhouette, and so neutralizing the effect of the colours used. These screens however had no effect whatever on a design depending solely on black, white, and blue for its contrast. Shortly after its adoption by the Admiralty dazzle painting was incorporated under the Defence of the Realm Act and the whole merchant service was ordered to be painted. Numbers of war-vessels operating with merchant ships were also painted: these comprised chiefly convoy cruisers, sloops and destroyers. The 10th Cruiser Squadron, engaged in blockade duties and composed entirely of large merchant ships, was also painted. These vessels were specially liable to attack, being at sea for long periods in submarine-infested zones and constantly under slow speed or altogether stopped for boarding purposes.

On the introduction of the scheme a considerable volume of maritime opinion was directed against it from lack of a proper grasp of its objects and because it appeared to render a vessel more conspicuous than was the case when painted grey. In point of fact at the date of the submission of the scheme the proposer, who was on patrol duty in the channel, had noted that all transports were painted a dead black from water-line to truck. The opposition, however, rapidly disappeared as soon as the objects of the scheme were thoroughly grasped and the rapidly increasing numbers enabled seamen to judge for themselves the difficulties of accurately estimating the accurate courses of dazzle-painted ships met with at sea.

The organization for producing designs in great variety and arranging for the rapid application of the designs to large numbers of vessels of great diversity of types was as follows:—

The mercantile marine was divided into 37 classes of characteristic types. For each type a small wooden model was made to scale and on this model a design was painted in wash colours. It was then carefully studied in a prepared theatre through a submarine periscope with a view to obtaining the maximum distortion. Behind the model were placed various sky backgrounds, the conditions of an average day at sea being obtained as nearly as possible. The model was slowly revolved on a turntable and observed from every point of view, any necessary alterations and additions being made until the distortion became such that an independent observer found it a matter of considerable difficulty to judge its orientation.

The model was then handed to a trained plan-maker who transferred the design in colour to a 1-16 in. scale plan on white paper showing port and starboard side (see Plate I.). Each colour on the plan was numbered to conform to the official colour charts, which gave a complete range of all colours used in dazzle painting (see Plate II.). It was one of the important factors essential to the success of the scheme that these colours should be rigidly adhered to by painting contractors.

The Dazzle Department was represented at all the principal shipping ports by one or more officers specially trained for the work. These officers were responsible for the issue of plans and the supervision of all ships painting in their districts. This work entailed a great deal of highly skilled supervision, as the actual painting fell upon the local painting contractors, whose men were entirely new to this kind of work. With the rapid expansion of the scheme however, upwards of 100 vessels were sometimes in hand at one port, difficulties were overcome and the work proceeded smoothly.

Soon after the establishment of the Dazzle Department, inquiries were made by the Allied maritime governments as to the efficacy of this new form of defence against the submarine. The French Ministry of Marine attached three officers for training under the new scheme and shortly afterwards set up a

similar department in Paris. The U.S. Navy Department asked that an officer might be sent to Washington; shortly after his arrival a dazzle department was formed to deal with U.S. shipping. The Belgian Government arranged for all their merchant vessels to be dealt with directly in the British department. Complete sets of plans were forwarded to Italy and Japan.

All U.S. destroyers and other patrol vessels in European waters were painted from plans supplied from the British department.

The number of vessels saved by this device can never be definitely ascertained as it cannot be known how many attacks were broken off by enemy submarines owing to a wrong position having been taken up as a result of inaccurate estimation of the vessel's course due to the dazzle painting. But the rapid expansion to all Allied merchant shipping showed that the authorities were satisfied that it played a great part.

Approximately 4,000 merchant ships were painted and upwards of 400 war-vessels engaged principally in convoy and patrol duties were also painted. The total cost of painting amounted to some £2,500,000. (N. W.)

CAMPBELL, BEATRICE STELLA [MRS. PATRICK CAMPBELL] (1865–), English actress (*see* 5.127), appeared at the Haymarket theatre, London, in *Lady Patricia* in 1911, and later in the same year at the St. James's theatre in *Bella Donna*. She also played Eliza Doolittle in Mr. Shaw's *Pygmalion* at His Majesty's theatre in 1914, and Leonora in Barrie's *The Adored One* at the Duke of York's theatre in 1913. In 1914 she married Mr. George Cornwallis-West. In 1917 she appeared in B. Veiller's American melodrama, *The Thirteenth Chair*, at the Duke of York's theatre, London, and in Nov. 1920 she played Lady Macbeth in Mr. James K. Hackett's production of *Macbeth* at the Aldwych. Her daughter, Stella Campbell, also became an actress.

CAMPBELL, SIR FRANCIS J. (1832–1914), British educator, was born near Winchester, Tenn., U.S.A., Oct. 9 1832. Having been blind from the age of three, he was educated at the school for the blind at Nashville, Tenn., and later at the university of Tennessee. He also set himself to learn music, and went to the conservatoires of Leipzig and Berlin. In 1872 he became principal of the Royal Normal College and Academy for the Blind at Norwood near London, which he, with the 1st Duke of Westminster and other philanthropists, had helped to establish. He retired in 1912. Amongst his recreations was Alpine climbing, and in 1885 he ascended Mont Blanc. He died at Norwood June 30 1914.

CAMPBELL, REGINALD JOHN (1867–), British divine (*see* 5.130), retired in 1915 from his ministry at the City Temple and in 1916 was ordained a clergyman of the Church of England. He became an hon. chaplain to the Bishop of Birmingham, and in 1917 was appointed vicar of Christ Church, Westminster.

CANADA (*see* 5.142).—Important measures, extending the boundaries of the provinces of Quebec, Manitoba and Ontario, were passed by the Canadian Parliament during the session 1911–2. The areas of the provinces and territories (for which see the separate articles under each heading) are given in Table I.

TABLE I.—Area and Population.

Provinces	Area (sq. m.) Land	Water	Total	Pop. per sq. m. of land area (1911)
Prince Edward Island	2,184	—	2,184	42·9
Nova Scotia . .	21,068	360	21,428	23·3
New Brunswick .	27,911	74	27,985	12·6
Quebec . . .	690,865	15,969	706,834	2·9
Ontario . . .	365,880	41,382	407,262	6·9
Manitoba . . .	231,926	19,906	251,832	1·9
British Columbia .	353,416	2,439	355,855	1·1
Alberta . . .	252,925	2,360	255,285	1·5
Saskatchewan . .	243,382	8,318	251,700	2·0
Yukon . . .	206,427	649	207,076	—
North-west Territories . .	1,207,926	34,298	1,242,224	—
Totals .	3,603,910	125,755	3,729,665	2·0

The water area given is exclusive of Hudson Bay, Ungava Bay, the Bay of Fundy, the Gulf of St. Lawrence, and all other tidal waters except the part of the St. Lawrence between Pointe-des-Monts and the foot of Lake St. Peter in Quebec.

There was in 1921 a fairly strong movement to unite Nova Scotia, New Brunswick and Prince Edward Island under a single government as a province to be known under the old name of Acadia.

Population.—The growth of pop. is shown by the following figures: 1871, 3,485,761; 1881, 4,324,810; 1891, 4,833,239; 1901, 5,371,315; 1911, 7,206,643. The pop. in 1921 was estimated at between 8 and 9 millions. The rate of increase of pop. greatly increased after 1896 on account of immigration from Great Britain, the United States and parts of central Europe. There are German settlements in Ontario and Nova Scotia, while Russians, Galicians, Polish and Russian Jews and Scandinavians have emigrated in large numbers to the western provinces and territories.

Immigration.—Table II. shows the immigrants entering the country for the fiscal years 1911 to 1921 inclusive.

TABLE II.—Immigration.

	From U.K.	From U.S.A.	From other countries	Total
1911	123,013	121,451	66,620	311,084
1912	138,121	133,710	82,406	354,237
1913	150,542	139,009	112,881	402,432
1914	142,622	107,530	134,726	384,878
1915	43,276	59,779	41,734	144,789
1916	8,664	36,937	2,936	48,537
1917	8,282	61,389	5,703	75,374
1918	3,178	71,314	4,582	79,074
1919	9,914	40,715	7,073	57,702
1920	59,603	49,656	8,077	117,336
1921	74,262	48,059	26,156	148,477

During 1911–21 18% British, 26% American and 29% of immigrants from other countries made entry for homesteads in western Canada. These figures do not account for the large number of farmers and farm labourers of the immigrant class who settled in all parts of the Dominion without homesteading. The number of Chinese immigrants during these years was 31,913 and of Japanese 7,195.

Municipal Statistics.—Table III. gives the statistics of cities and towns of 10,000 and over, showing population, total assessed value of the taxable property, and liabilities, for the year 1919.

Agriculture.—The value of agricultural production in the Dominion, including live stock in hand, was in 1918 about $2,360,000,000, or nearly twice the value of the production of manufactures and over 12 times the value of mineral production in the same year. It was estimated by the Department of the Interior that in 1921 there were still 200,000,000 ac. of vacant land in the Middle West available for, or at least susceptible to, some form of agriculture.

The only item of agricultural production in which in 46 years up to 1918 there was shown a decrease was the number of sheep (2,369,-358 in 1917; 3,155,509 in 1871). It is difficult to account for this, except for the fact that the price of wool was for many years very low, and sheep have always been in Canada what a commercial man would call a side-line. Canada, however, is especially well adapted for sheep and goat raising and breeding. There are millions of acres, not only in the West but in the older provinces, that could be used for the purpose without impinging on the other more fertile lands. In portions of Ontario, Nova Scotia and New Brunswick there is much cleared and partly cleared land apparently going to waste that might be devoted to sheep culture. In the Middle West and in British Columbia there are approximately 50,000,000 ac. suitable for sheep and goat culture. There are no long droughts, as in Australia, and there is comparative immunity from disease; in the past the great enemies of sheep in Canada have been dogs and wild animals.

Factory cheese (194,904,336 lb. in 1917; 220,833,269 lb. in 1900) also suffered a decline in production, on account of the greater demand for creamery butter and the more profitable outlet for milk and cream in the urban centres. So great is this latter demand that the whole of N. America is affected by it. In live stock—particularly dairy and beef cattle (7,920,940 head in 1917; 2,624,290 in 1871) and swine (3,619,382 in 1917; 1,366,083 in 1871)—lies Canada's greatest agricultural prospect, because cattle give to the soil the greatest return in fertility. They are the necessary link in the rotation of crops; and Canada, with her vast area, her abundant water, her adaptability for growing fodder crops, and her advantageous position in respect of foreign markets for dairy products and meats, is in a position of great advantage. Despite the use of motors, the number of horses in Canada has increased (3,412,749 in 1917), and there is still a good future for selected breeds of draught, riding and race horses.

On account of the labour situation, in which farmers are practically deprived of outside help, agriculture in Canada, as elsewhere in America, resolves itself into self-help, and therefore has become a question of small mixed-farming, limited to special lines in which machinery may be utilized and only a minimum of labour required. In the Maritime Provinces and Ontario farms are practically denuded

TABLE III.—Principal Cities.

City	Population	Total assessed value taxable property	Total liabilities
Montreal	706,600	$623,820,959	$124,802,327

Levis	10,000	3,556,695	949,711

of domestic labour. It was felt that the success of the Soldier Settlement Scheme, which was greater even than had been anticipated, and the wide attention which Canada's agricultural capabilities were attracting in Great Britain and other countries, might do much to relieve the situation. Each province presents its peculiar problems of settlement. In British Columbia, for instance, the opportunities are mainly limited to fruit-growers and those who wish to engage in vegetable and poultry raising and small mixed farming, having live stock always in view. In the Middle West, although the live-stock idea was taking strong root, the prevailing cultivation was in 1921 still wheat, though much attention was being paid by the larger and more progressive farmers to live stock and, so far as possible, to diversified farming. Western Ontario, one of the richest sections of Canada, is devoted to live stock, grain growing, maize, beans, sugar beet, tobacco and fruit. It has the greatest diversity of products, and in addition to a rich soil it has plenty of summer heat, growing tomatoes, peaches and grapes to perfection. Eastern Ontario is less favoured in its climate but rich throughout. Quebec contains much fertile land in the valley of the St. Lawrence, and on account of the habits and instincts of the habitant population is very closely cultivated. The farmers of Quebec are the most contented in Canada. The Maritime Provinces have suffered greatly from emigration to other provinces and to the United States, and a good deal of their useful and once cultivated land is not producing to anything like its capacity. Repopulation and repatriation are among the needs of parts of Ontario and the Maritime Provinces and are among the greatest problems of Government.

The values (in dollars) of various Canadian agricultural products are given in Tables IV. and V.

TABLE IV.—Field Crops.

	1918	1919
Wheat (fall)	16,516,000	31,521,000

Fruits	..	1,975,841,000

Forests.—Canada's annual forest growth is several times in excess of the annual cut. The production of timber was valued at $190,000,000 in 1917. The Federal Government has jurisdiction over the timber of the three Middle West provinces, and of the Territories and of the Railway Belt in British Columbia, and has created Federal reserves to the extent of over 28,000,000 acres. It carries on, in addition, an extensive system of seeding and free distribution of trees in the three prairie provinces. In 1917 it allotted nearly 8,000,000 trees to about 10,000 applicants and the Government farms had 9,000,000 seedlings and cuttings available for distribution. The provinces have adopted a similar policy of timber reserves, and the total areas reserved increased from 714,000 ac. in 1901 to nearly 153,000,000 ac. in 1917. These timber reserves are also for the maintenance of water supply and for the protection of wild animals and birds. Canada has always had a large export trade in timber and lumber. The total value of unmanufactured products rose from nearly $19,000,000 in 1888 to about $56,000,000 in 1917, and of manufactured products $71,500,000 to $146,330,192 in 1918, one factor in the increase being increased value of wood products.

British Columbia stands first in respect of forest organization and scientific administration. It has a well-organized forest service and has initiated special scientific investigations. This work, however, was hindered by the drafts on skilled man-power during the World War. Ontario has undertaken a reorganization of its protective and administrative work. Quebec, following somewhat in the footsteps of France, recognized the necessity for technical training from the first and has a forest school in connexion with Laval University. In New Brunswick similar steps were being taken in 1921.

Table VI. gives an estimate of Canada's stand of timber, mainly coniferous. In the Prairie Provinces the figures may be taken as representing practically all spruce, which in Ontario comprises 100,000,000,000 ft. of the total; in Quebec 150,000,000,000 ft.; in New Brunswick 16,500,000,000 ft., and in Nova Scotia 15,000,000,000 feet. In British Columbia Douglas fir is the dominant timber tree, the rest of the cut being made up of cedar, spruce and one or two minor varieties.

TABLE VI.—Timber, in feet.

British Columbia[1]	366,000,000,000
Prairie Provinces	60,000,000,000
Ontario	160,000,000,000
Quebec	275,000,000,000
New Brunswick	22,000,000,000
Nova Scotia	20,000,000,000
	903,000,000,000

[1] British Columbia is credited with 366,000,000,000 ft. of commercial timber, but her own forestry experts have estimated it at 400,000,000,000 ft. and even as high as 450,000,000,000 ft.

According to official figures in 1921, the capital invested in the Canadian lumber industry was $231,203,247; the value of products $222,648,790, including sawn lumber $129,041,688. The capital invested in the Canadian pulp and paper industry in 1919 was $264,581,300; the production of paper having a value of $91,362,913 and of pulp $48,562,088.

Wild Animal Life.—The establishment by the Government of parks and game and forest reserves or "sanctuaries" is of much importance in connexion with the conservation of the furry animals, the value of which may be gauged by the fact that the exports of Canadian furs of all kinds rose from $5,569,476 in 1914 to $13,737,621 in 1919. The constant expansion of the settled area has caused some kinds of fur-bearers to retreat farther into the woods; the clearing of the forests and the grazing of the natural coverts by domestic animals have destroyed their haunts and exposed them to their enemies; and the draining of swampy areas has destroyed the homes of the musk-rat or musquash, the mink, the otter and the beaver. The fisher and the marten never seem to survive long near man's habitation. Even the fox, which appears to increase near human settlements, will decrease if the forests are wholly removed or burned. The official policy is to inject new social life, so to speak, into the communities of wild animals, protecting what were left by the fur-hunters, the ruthless sportsmen and the Indians, and preserving and multiplying them under more favourable conditions for future generations. The park reserves for wild animals aggregate 10,000 sq. m. in extent.

Other undertakings on a more expansive scale will probably result from Government investigation and action. The wood buffalo or wild bison may be incorporated with the buffalo herds, and would probably improve the latter. The millions of caribou in the Yukon and adjacent territory and the musk-ox of the barren lands are likely to be nationalized and dealt with like other concessions for the benefit of the nation's meat larder. Domestic reindeer will be imported, as has been done in Alaska, and a cross with the caribou would probably produce a better variety than either. The mountain sheep is as capable of being domesticated as the reindeer, and the several thousand in existence in isolated flocks in British Columbia and Alberta may become herds. Animals of certain genera become tame when not hunted; this is also true of wild geese, ducks, swans and quail, of which Canada was a wonderful breeding ground. There are further possibilities of dealing with bear, beaver, mink, marten and other animals according to their habits and habitat.

Fur-farming, one of the new industries of Canada, is only a new form of the old and once termed "honourable" business of fur-taking and fur-trading. The difference is that wild animals are now bred and reared in captivity for furs and for breeding stock. In Prince Edward I. fox-farming has made some fortunes, and the sales are included in the agricultural returns of the province; the industry has been extended to New Brunswick, Quebec and British Columbia.

Fisheries.—Commenting on Canadian fisheries, an official report points out that: "The fertility of Canadian waters is indicated by the fact that the entire catch of salmon, lobster, herring, mackerel and sardines, nearly all the haddock, and many of the cod, hake, and pollock landed are taken within 10 or 12 m. from shore." The coast-line of the Atlantic provinces from Grand Manan to Labrador, not including lesser bays and indentations, measures over 5,000 m., whilst the sea areas to which this forms the natural basin embrace: the Bay of Fundy 8,000 sq. m. in extent; the Gulf of St. Lawrence, fully ten times that size; and other ocean waters aggregating not less than 200,000 sq. m.; a total of over four-fifths of the fishing grounds of the N. Atlantic. In addition there are 15,000 sq. m. of inshore waters owned by the Dominion. Large as are these areas, they represent only a part of the fishing grounds of Canada. Hudson Bay, with a shore 6,000 m. in length, is larger than the Mediterranean; the Pacific coast of the Dominion measures over 7,000 m. long, and is exceptionally well sheltered for fishermen; and throughout the interior is a series of lakes which together cover 220,000 sq. m., or more than one-half the fresh water of the globe, Canada's share of the Great Lakes of the St. Lawrence basin covering 72,700 sq. miles.

The fisheries of the Atlantic are divided into deep-sea and inshore or coastal fisheries. Deep-sea fishing is pursued in vessels of from 40 to 100 tons, carrying crews of from 12 to 20 men. The method is "trawling" by hook and line. The fish taken are principally cod, haddock, hake, pollock and halibut. The inshore fishery is carried on in small boats, usually motor-driven, and in a class of small vessels with crews of from four to seven men.

All the provinces have fisheries departments, and these, along with the department of Ottawa, are endeavouring to conserve and develop the fisheries' resources to their utmost extent by means of hatcheries, cultural methods, investigation and restrictive regulations. It is estimated that between 1,000,000,000 and 1,500,000,000 of fish fry of one kind and another are annually planted in various waters from a large number of hatcheries. Long efforts have succeeded in bringing about a treaty to secure international regulations. The Scientific and Research Council has taken up the question of utilizing fish waste. There are over 300,000 tons of fish waste in Canada each year, of which perhaps half could be converted into nitrogenous and phosphate fertilizers and protein foods for cattle, hogs and poultry.

The salmon (product valued at $15,595,970 in 1920) is obtained almost exclusively on the Pacific coast. Those taken in Quebec, New Brunswick and Nova Scotia resemble those of Great Britain and are regarded as superior for table use. Only one salmon in British Columbia, the steelhead, may be said to be closely allied to the eastern salmon, and it does not run in large numbers. Cod fishing ($6,270,171 in 1920) is largely prosecuted on the Atlantic coast and is one of the most useful and valuable of eastern fisheries. The lobster fishing ($7,152,455 in 1920) has been confined to Nova Scotia, Prince Edward I., New Brunswick and Quebec waters. It is the most extensive in the world, but shows signs of depletion. Herring fishing ($3,337,738 in 1920) is carried on quite extensively on both coasts. There is in the Great Lakes a fresh-water herring which is becoming popular throughout central Canada. Haddock, hake and pollock are extensively taken in the Atlantic deep-sea fishing. Halibut fishing ($4,535,188 in 1920) was once a most important industry on the Atlantic seaboard, but its principal headquarters are now at Prince Rupert. Over-fishing is having its effect on the north-west coast and deep-sea fishermen are turning to kinds hitherto neglected. Sardines are abundant in British Columbia and New Brunswick waters, and in the latter province an extensive industry has been established, as in Norway and France, in tinning them. Mackerel are obtained in the Atlantic coast waters. Smelts are very plentiful on both coasts, but particularly in British Columbia waters, where another fish belonging to the *salmonidae* group, and much resembling it is the oulachon, or candle-fish. The Alaska black cod, when it can be obtained quite fresh or properly cured, is perhaps the most-prized fish on the Pacific coast.

Trout, which are included under a number of names, are taken in all the lakes and rivers from coast to coast, and, while they are not fished for commercially in the same way as other fish, find their way into the market in fair quantities during the season. The whitefish of the Great Lakes and other lakes of the northern interior is among the most valuable of the fresh-water varieties. Pickerel, pike and tullibee are other valuable fish very common in Canadian waters; pickerel is mainly confined to Ontario and Quebec. Other kinds of fish important in the aggregate are—perch, bass, alewives, carp, maskinonge, sturgeon, shad and soles.

Oysters were formerly very abundant on the Atlantic coast, especially in Prince Edward I. waters, whose malpeques were famous, but over-fishing and disease have almost depleted the beds. Whaling is carried on extensively on the Pacific coast, where the industry is concentrated on the west coast of Vancouver Island. In addition to whale oil, fertilizer and whale meat are sold as by-products. Edible clams are distributed widely over both coasts, but especially on the Pacific. According to the official figures, the total output of Canadian fisheries in 1920 was valued at $49,321,217, as against $33,103,748 in 1913. The increase was largely due to the increased food-demand caused by the war. Capital to the extent of $30,334,129 is represented in fish canning and preserving establishments, and $29,887,734 in vessels, boats, nets, etc., while about 87,070 people in all are employed.

Minerals.—In 1906 the value of the total mineral production was $79,286,202; in 1917 it had risen to $89,646,821 and in 1920 to $217,775,080. The Canadian deposits of nickel and asbestos are among the most important in the world, yielding sufficient to control the market in these commodities. The chief mineral productions in 1920 were coal, nickel, gold, cement, copper, asbestos and silver.

The coal reserves of Canada are second in the Empire, amounting to 1,234,000,000,000 tons, of which over 1,000,000,000,000 tons are in Alberta and Saskatchewan. Owing to the long stretch between Saskatchewan and Nova Scotia which is coalless, Canada imports from the United States 50% more coal than she produces. This will be remedied, in part at least, if experiments inaugurated and being carried out by the Dominion Government in 1921 are successful. There are vast deposits of lignite in Saskatchewan, too low in grade to be used as fuel in its present form, but which it has been proposed, at the instance of the Industrial Research Council, to carbonize and briquette for commercial use, laboratory tests having demonstrated its high fuel value. There are, too, enormous deposits of peat in the central and other areas of Canada, estimated, if convertible into compressed fuel, as equivalent to 5,000,000,000 tons of coal, and likely to afford many valuable by-products in addition. Experiments on a commercial scale were being carried on by the Government to this end also. Coal represented the largest mineral output in Canada in 1921, the total being valued at $77,000,000.

Iron occurs in large deposits in British Columbia, northern and central Ontario (especially in the Lake Superior region), in Quebec, Nova Scotia and New Brunswick, and probably also west of Hudson Bay about Great Bear and Slave Lakes, the tonnage already produced being stated in 1920 at over 365,000,000 tons. The fact that 96% of the iron ore smelted in Canadian blast furnaces in 1918 was imported was due to the ore of all accessible large deposits requiring special treatment ("beneficiation") before being charged to the furnace; there were two large beneficiary plants for this purpose in Ontario, but more such plants were needed before the iron-ore mining could attain its proper importance. Canada had nine blast furnaces with an aggregate daily capacity of 3,782 tons, and yet she imported in 1919 over 2,000,000 tons of ore. The Nova Scotia blast furnaces are fed from Newfoundland, and Ontario furnaces mainly from the iron-mines of the United States Lake Superior region.

The placer deposits of British Columbia were formerly the principal supply of gold in Canada, but had seriously declined in

production when the Yukon came suddenly into prominence in 1897 as a new source of supply. Then Porcupine loomed on the horizon as a rich producer, and Ontario as a consequence in 1920 yielded half the total production, viz. $11,665,735. Manitoba has become a small producer, the gold being derived from the newly opened region north of the Pas. Nova Scotia and Quebec have been small but steady producers for years. There are inviting prospects for gold over large areas of northern Ontario, northern Quebec, northern Manitoba and Saskatchewan, and throughout British Columbia.

In 1890 and 1891 rich discoveries in silver were made in the Slocan district of British Columbia, the silver being found associated with lead in galena ores. The province has since been a large producer both of silver and lead, and now also of zinc, which is usually a concomitant of lead and silver in the Kootenay silver-lead ores. In 1903, however, deposits were discovered in northern Ontario about 100 m. north-east of Sudbury, in what is now known as Cobalt, which proved to be marvellously rich in silver, so much so that in 1911 the production there was over $30,500,000. The Thunder Bay region west of Port Arthur yielded silver as far back as 1846, and attention is again being directed to the old mines.

Despite the fact that for a number of years Government bounties were paid on lead and zinc mined and smelted in Canada, the output of these metals did not increase, except during the war, when the demand for lead eliminated the bounties automatically, and new processes made the extraction of zinc practicable. Nearly all the production in both metals is in British Columbia, although Quebec and Ontario contribute small amounts. There are notable deposits in several parts of Ontario, in the Gaspe Peninsula, Quebec, and in northern New Brunswick.

Copper is widely distributed throughout Canada and where found is usually in large bodies. Of nearly 110,000,000 lb. produced in Canada in 1917, British Columbia contributed well over one-half, Ontario came next with about 43,000,000 lb., drawn mainly from the Sudbury district, and Quebec third with over 5,000,000 lb. The new district of the Pas gave over 2,000,000 lb. and the Yukon about 300,000 lb. Depending upon the future demands for copper, the possibilities of Canada in British Columbia, in the Yukon, in the extreme north of Canada, in northern Ontario and in Quebec, including Ungava, are without doubt very great.

Sudbury district in Ontario, which is characterized by the richness and diversity of its minerals, is the chief source of nickel. Two very large companies are in operation and have constructed refineries, their investments representing between $15,000,000 and $20,000,000. New Caledonia, lying about 1,000 m. east of Australia, is the only serious competitor to Canada in nickel production. Among the other metals whose ores are mined in Canada are molybdenum and antimony, very widely distributed, but of which very few payable deposits are known. Platinum occurs in the placer deposits of Quebec and British Columbia, and prospecting is active.

The total mineral production (metallic and non-metallic) of Canada in 1920 was valued at $102,353,862, including the following items: coal, $77,326,853; nickel, $24,854,597; gold, $15,853,478; copper, $14,166,479; asbestos, $13,677,841; silver, $12,908,683; zinc, $3,081,149; lead, $3,038,346; pig-iron, $2,066,997. The output of structural materials and clay products was valued at $38,184,848.

Water-Power.—The officials of the Dominion Water-power Branch, Department of the Interior, have made a careful re-analysis of the water-power resources, which are one of the Dominion's greatest natural assets. The figures in Table VII. are based upon rapids, falls and power sites, of which the actual existent drop or the head possible of concentration is definitely known or at least well established. Innumerable rapids and falls of greater or lesser power capacity not as yet recorded are scattered on rivers and streams from coast to coast, particularly in the great northern country, much of which is still practically unexplored. The power estimates have been calculated for 24-hour power at 80% efficiency on the basis of "ordinary minimum flow" and "estimated flow for maximum development." The former is derived from the averages of the minimum flow for the lowest two consecutive seven-day periods in each year, over the period for which records are available, and the latter from the continuous power indicated by the flow of the stream for six months in the year. As will be seen from the table, the recorded power available throughout the Dominion is 18,255,000 H.P. The water-power available under estimated flow for maximum development, that is, dependable for at least six months in the year, is 32,076,000 H.P.

There are installed throughout the Dominion water-wheels and turbines to the extent of 2,471,000 H.P. An analysis of the water-power plants scattered from coast to coast gives an average machine installation 30% greater than the six-month flow maximum power. Applying this, the figures indicate that the water-power resources recorded in 1920 permit of a turbine installation of 41,700,000 H.P. In other words, turbine installations represented in 1920 only 5·9% of the recorded water-power resources. Though industrial and commercial conditions were still far from normal, in 1920 there was installed, or under construction, plant of 500,000 H.P. capacity. This figure, however, includes only initial installation, not ultimate designed capacity. Should the rate of water-wheel installation during the previous 15 years be continued, it was estimated that in 1940 Canada would have 5,600,000 H.P. developed water-power.

TABLE VII.—Water-Power.

Province	Available 24-hour power at 80% efficiency.		Turbine Installation H.P.
	At ordinary min. flow H.P.	At est. flow for max. dev. (dependable for 6 mos.) H.P.	
British Columbia	1,931,142	5,103,460	304,535
Alberta .	475,281	1,137,505	32,492
Saskatchewan . .	513,481	1,087,756	—
Manitoba . . .	3,270,491	5,769,444	83,447
Ontario . . .	4,950,300	6,808,190	1,052,048
Quebec . .	6,915,244	11,640,052	925,972
New Brunswick .	50,406	120,807	21,180
Nova Scotia . .	20,751	128,264	35,774
Prince Edward I. .	3,000	5,270	1,933
Yukon & North-west Territories . .	125,220	275,250	13,199
	18,255,316	32,075,908	2,470,580

Canada exports annually about 200,000 H.P. to the United States. The export takes place from New Brunswick to Maine, from Quebec to New York state, from Ontario to New York and Minnesota, and from British Columbia to the state of Washington.

Manufactures.—The increase in the industries of Canada during the period 1910–21 was very remarkable. War activities and increased prices accounted to a considerable extent for increased volume of production and value of output. In 1921 industry in all branches showed the decline in output which was almost universal on account of lack of foreign demand and industrial disputes. The capital employed was $1,247,583,699 in 1910, and $3,034, 301,915 in 1918; and the value of product $1,165,975,639 in 1910 and $3,458,-036,975 in 1918.

The principal industries, with the value of products in 1918, were officially as follow: Flour and grist-mill products, $262,537,122; slaughtering and meat-packing, $229,231,666; rolling-mills and steel furnaces, $209,706,319; munitions, $186,034,920; lumber, lath and shingles, $146,333,192; pulp and paper, $119,309,434; butter and cheese, $94,927,032; foundry and machine-shop products, $82,493,-897; shipbuilding and repairs, $74,799,411; cottons, $66,399,228; cars and car works, $66,068,705; smelting, $62,482,256; house-building, $60,522,151; sugar-refining, $58,812,219; electric light and power, $53,449,133; boots and shoes, $46,387,665; hosiery and knit goods, $45,755,129; plumbing and tin-smithing, $41,870,529; car repairs, $40,972,617; drugs and chemicals, $38,252,587; tobacco, $37,883,974; agricultural implements, $34,853,673; fish-preserving, $34,007,628; men's clothing, $33,835,793; leather, $33,273,925; women's clothing, $32,346,340; printing and publishing, $30,325,123; electrical apparatus and supplies, $30,045,399; boilers and engines, $29,470,457; lumber products, $29,125,925.

Trade.—The great expansion of trade during 1910–21 is shown in Table VIII., which gives the value of imports and exports.

TABLE VIII.—Imports and Exports.

	Imports	Exports
1911 .	$ 452,724,603	$ 290,000,210
1912 . .	522,404,675	307,716,151
1913 . .	671,207,234	377,068,355
1914 . . .	619,193,998	455,437,224
1915 . .	455,955,908	461,442,509
1916 . .	508,201,134	779,300,070
1917 .	846,450,878	1,179,211,100
1918 . . .	963,532,578	1,586,169,792
1919	919,711,705	1,268,765,285
1920 . . .	1,064,528,123	1,286,658,709

The principal customers were the United Kingdom and the United States. Table IX. gives the values of Canada's imports from, and exports to, the United States; and Table X. Canada's imports from, and exports to, the United Kingdom.

Railways.—The Canadian railways in 1921 had become consolidated into two great systems, the Canadian Pacific and the National railways. In 1918 there were 38,875 m. in operation, over 20,000 of which were under Government control. The capitalization of railways in operation at the end of 1918 was $1,998,880,494, and the aggregate earnings for the year were $330,220,150. There are six canal systems under the control of the Dominion Government.

As a result of the war the railway situation had changed very materially from one of optimism in 1912–3 to one of almost painful anxiety in 1919. This arose from the inability of the Canadian Northern on the one hand to sell its bonds to complete its transcontinental system, and of the Grand Trunk, on the other, to meet its interest and other obligations in connexion with the Grand Trunk Pacific, and to cope with the increased working-costs arising out of war conditions. Repeated appeals were made to Parliament for further financial aid. A Royal Commission, consisting of three eminent railway experts, was appointed to inquire into the entire railway situation of Canada, and after an exhaustive investigation there was issued what was known as the Acworth-Drayton (majority) report, practically recommending that the Canadian Northern should be taken over by the nation, amalgamated with the national railway system and operated under a council of a board of directors. A system which would apply if and when the Grand Trunk and Grand Trunk Pacific were taken over was also recommended. The nationalization of the Canadian Pacific was not recommended. The recommendations of the majority report of this commission became the policy of the Government, and on June 30 1918 the Canadian National ceased to be an independent entity. In the legislation of 1917 authorizing acquisition provision was made for acquiring the balance of capital stock, amounting to $60,000,000, not in the hands of the Government, its value to be determined by arbitration. This was fixed at $10,800,000, and the transfer was made. The system is now operated by a board of directors, of which in 1921 Mr. D. B. Hanna was president. The Grand Trunk, meanwhile, desired to be relieved of its obligations in connexion with the Grand Trunk Pacific and National Transcontinental. In the spring of 1918 the Grand Trunk Pacific notified the Government that it would not be possible for the company to continue its operations when the balance of money in hand had been exhausted (about March 10), and authority was immediately taken by Order in Council under the provisions of the War Measures Act to appoint a receiver for the company, Parliament having confirmed this action. In the fall session of Parliament a bill was introduced and passed authorizing the acquisition of all the capital stock of the Grand Trunk system, the Government, however, guaranteeing 4% dividends as well as interest upon present debenture stock outstanding. The value of the preference and common stocks (up to a maximum of $2,500,000) was to be determined by a board of three arbitrators, and a committee of management was to be formed—two members to be appointed by the Government, two by the Grand Trunk and a fifth by the four so appointed—to ensure as far as possible the operation of the railway in harmony with the Canadian National system. This went into effect. Not without some difficulty the consent of the Grand Trunk shareholders was obtained and arbitrators agreed to. Sir Thomas White, late Minister of Finance, acted for the Government; Mr. Wm. H. Taft, ex President, and later Chief Justice of the Supreme Court, of the United States, acted for the Grand Trunk; Mr. Justice Walter Cassels, Ottawa, was chairman of the board. In September 1921 their awards were published. The two Canadian arbitrators held that "no value" attached to the common and preference stocks, though it would be for the Government to decide whether it should go outside the sphere of the arbitrators in granting *ex gratia* compensation. In a dissenting judgment, Mr. Taft held that their "value" was higher than the maximum provided in the Act.

It was further contemplated that all the railways built or acquired by the Government would eventually be amalgamated into one large system, operated by a National Board of Directorate. During the several sessions in which the legislation referred to was brought about very keen and protracted discussion, involving largely the principle of Government ownership, took place. The opposition was greatly emphasized by announcements of increasing deficits in the operation of the National system in 1920–1, the amount being, it was stated, $68,000,000. Five steam railways paid dividends during 1919: the Canadian Pacific $29,227,277, and four others in the aggregate $761,000. The average number of miles operated in March 1921 was 38,076·30. The Canadian Pacific and the National railways (including the Grand Trunk) operated over 85% of the total single-track mileage, as follows: Canadian Pacific 13,785 m.; Government railways (under jurisdiction Department of Railways) 4,564 m.; Canadian National (under board of directors) 9,757 m.; Grand Trunk Pacific (under receiver) 2,807 m.; Grand Trunk 3,571. The total mileage of Government roads in Canada was in 1921 20,699. The mileage of independent railways was: Algoma Central 347; Algoma Eastern 89; Quebec Central 277; Victoria, Vancouver & Eastern (Great Northern) 269; Kettle Valley (Canadian Pacific) 355; Père Marquette 199; Canada Southern (Michigan Central) 380; Dominion Atlantic (Canadian Pacific) 274; Great Waterways (Province of Alberta) 113; Edmonton, Dunvegan & British Columbia (Alberta Government, operated by C.P.) 406 miles.

The total capitalization of steam railways on Jan. 1 1921 was $2,036,165,606, of which $568,606,803 belonged to the Canadian Pacific, $451,685,996 to the Grand Trunk, $417,924,087 to the Canadian National, $413,590,078 (capital expenditure) to the Canadian Government railways (including National Transcontinental & Hudson Bay railway), and $216,512,540 to Grand Trunk Pacific and branch lines. Salaries and wages amounted to $233,323,-074 and the number of employees to 173,728. There was a total corporate loss on operation for the year of $15,097,747. The track mileage of electric railways amounted to 2,400 miles. Capital stocks outstanding and funded debt of these amounted to $173,041,340, and $20,211,576 wages were paid to 16,940 employees.

Canals.—The river St. Lawrence, with the canals established on its course above Montreal, and the lakes Ontario, Erie, St. Clair, Huron and Superior, with connecting canals, afford a course of water communication extending from Montreal to Port Arthur, at the head of Lake Superior, a distance of 1,214 miles. The distance to Duluth is 1,336 m. and to Chicago 1,242 m. This through system comprises 74 m. of canal with 48 locks, the remainder of the distance consisting of river and lake waters. The minimum depth of water on this route is 14 feet. The canal approaches and the channels of the intermediate river reaches are well defined, and are lighted with gas buoys, admitting of navigation by night as well as by day. The Lachine, Soulange, Cornwall, Welland and Sault Ste. Marie canals are lighted throughout by electricity, and are electrically operated.

In view of the agreement signed by the members of the International Waterways Commission, it may be noted that the St. Lawrence river is the greatest waterway in the world and the oldest in use in the New World. There are no floods in the St. Lawrence as in the Mississippi, the Columbia or other large rivers of the continent. The difference between maximum and minimum volume is 1·19 ft., as compared with the Ohio, 28·22 ft.; the Missouri, 29 ft.; and the Mississippi, 10·29 ft. The lakes act as settling basins and no silt is carried down to be deposited in the river. Hence when a channel is dredged, the dredging process does not require to be continuous as in most other rivers. Between Montreal and Quebec the river was deepened some years ago to 30 ft. and work is in progress to increase it to 35 ft., so that the largest ocean vessels may dock at Montreal. Canals have been built at various times to overcome the rapids between Lake Ontario and Montreal, and six of these, varying in length from 0·75 to 14 m., in width from 144 to 146 ft., and in depth from 14 to 15 ft., are in existence. To make the waterways scheme feasible, this section of the river would have to be so improved as to admit the passage of ocean vessels. The Welland Canal, which was being rebuilt between Port Colborne on Lake Erie and Port Waler on Lake Ontario in 1921, will be 80 ft. wide and 30 ft. deep. It will be able to accommodate ocean vessels and will form the key of the entire scheme of oceanizing the international waters of Canada, if that should be decided upon. Locks on the "Soo" Canal have opened Lake Superior to the world, and improvements from Lake Superior to Detroit have been made to render navigation on the proposed scale practicable. Incidentally, the scheme involves the development of water-power estimated at 2,000,000 H.P.

Of the minor systems, the Murray, Trent, Rideau and Ottawa river canals may be considered as branches of the through east-to-west route. In operation, however, these canals serve a distinct traffic of a more local nature. Isolated from the system of through navigation, the navigation of the Richelieu river, from its junction at Sorel to Lake Champlain, is effected by means of the St. Ours lock and the Chambly Canal, while to the extreme east the St. Peter's Canal provides communication between St. Peter's Bay, in Cape Breton, Nova Scotia, with the Bras d'Or lakes. It crosses an isthmus half a mile in width, and gives access to the Atlantic. A ship canal was in course of construction from Port Dalhousie to Port Colborne, connecting Lake Ontario and Lake Erie; work was suspended on account of war conditions. Among projected works may be mentioned what is known as the Georgian Bay Canal, to connect the Ottawa river with Georgian Bay. Some years ago the Government engineers surveyed the route, and reported that a waterway with a depth of 20 ft. could be provided at a cost of about $100,000,000. By this route the distance from Fort William to Montreal would be 934 m., as against 1,217 by the present route, and Montreal and Chicago would be brought within 972 m. of each other, as compared with 1,242 by the present route.

Roads.—At the end of 1920 about 250,000 m. of public highways in Canada were open and serviceable for ordinary travel during the

summer season. The roads are graded and crowned, with suitable drainage, culverts and bridges. The mileage in the nine provinces is fairly evenly distributed, in accordance with area and population. In five of them the roads have been made and maintained at the expense of the Provincial Governments; in the other four the cost has been borne by the municipalities and Provincial Governments in coöperation. During recent years there has been a very large increase in the number of automobiles using the roads, and for this reason a harder and smoother road surfacing has been necessary. All road work on main roads is done on approved high standards, with hard finished surfaces consisting of gravel and stone macadam, cement concrete, asphaltic surfacing—in every instance asphaltic or some bituminous surfacing or oil treatment. To assist the provinces and municipalities in this respect, the Dominion has passed legislation by which it is empowered to furnish aid to the extent of 40% of the cost of high-class improvement upon main highways. The amount devoted to this purpose is $20,000,000, to be spread over a period of five years, the aid to be given, in any case, being 40% of the amount which is the actual, necessary and reasonable cost of the construction or improvement of such highway. The conditions attached to the grant are that any construction or improvement shall be in accordance with the terms of an agreement to be made by the Minister of Railways and Canals of Canada with the Provincial Government, and that the agreement shall contain such provisions as to location, cost, description, specifications, etc., as are necessary to protect the public interest, all expenditure being by tender and contract.

Finance.—The Canadian Bank Act contains no specific provisions as to the amount of gold to be held either against note circulation or the general business of the bank. It requires, however, that 40% of whatever reserve the bank finds expedient to carry shall be in Dominion notes. A second provision instructs the Minister of Finance to arrange for the delivery of Dominion notes to any banks in exchange for specie. Thus the gold reserve against Dominion notes, to the extent that the notes are held by the banks, is a reserve against banking operations, the Dominion Government being the custodian of the gold for the banks. The other gold element in bank reserves is specie in hand. The sum of the two represents the gold basis of the Canadian banking system. In addition to the reserves above mentioned the Canadian banks carry three other kinds of assets which are regarded as reserves, being funds more or less immediately available for the liquidation of liabilities. In 1906 there were 34 chartered banks with branches numbering 1,565. Since that time there has been very considerable consolidation. In 1921 the number of banks was 18, but the number of branches had more than doubled, being now in various provinces 3,440. The banks are required by law to furnish to the Minister of Finance detailed monthly statements which are published in the official gazette. Clearing-houses have been established in the chief commercial centres and cover the operations of Canada as a whole. On Dec. 31 1919 the paid-up capital of the banks was $119,199,441, with a note circulation of $232,486,734 and total deposits amounting to $1,841,478,895. The total liabilities at that time amounted to $2,495,582,568 and total assets $2,754,-568,118. At the end of 1919 the total amount to the credit of depositors in the Post Office and Dominion Government savings banks was $53,057,018. The amount on deposit in the savings departments of the chartered banks was $1,125,202,403.

The Dominion revenue and expenditure in 1914–20 are shown in Table XI. Up to March 31 1920 the total outlay for the war was approximately $1,670,406,342. This amount includes all expenditures in Canada, Great Britain and France, and is also inclusive of the upkeep of the troops overseas.

TABLE XI.—Revenue and Expenditure: March 31 1914–March 31 1920.

	Revenue	Expenditure—Consolidated Fund
1914–5	$133,073,481	$135,523,206
1915–6	172,147,838	130,350,726
1916–7	232,701,294	148,599,343
1917–8	260,778,952	178,284,313
1918–9	312,946,747	232,731,282
1919–20	349,746,334	303,843,929

	Expenditure—Capital Account	Expenditure—War Accounts
1914–5	$41,447,320	$ 60,750,476
1915–6	38,566,950	166,197,755
1916–7	26,880,031	306,488,814
1917–8	43,111,904	343,836,802
1918–9	25,031,266	446,519,439
1919–20	69,301,877	346,616,954

The net debt of Canada, which before the war stood at about $363,000,000, on March 31 1920 was $2,248,868,623. The increase was almost entirely attributable to war expenditure. Details of the domestic loans issued by the Canadian Government since the commencement of the war are given in Table XII. In addition War Savings Certificates to the amount of approximately $12,500,-000, as well as a considerable amount of debenture stock, were sold. Loans were also floated in New York for: (1915) $874,000, (1916) $75,000,000, (1919) $15,000,000, (1919) $60,000,000. From the outbreak of war to Nov. 30 1918 Canada established huge credits on behalf of the Imperial Government. Through these advances Great Britain and her Allies were able to finance the purchase of food-stuffs, hay and other commodities and to carry on the operations of the Imperial Munitions Board in Canada. In addition to the above, Canadian chartered banks advanced to the Imperial Government through the medium of the Minister of Finance the sum of $200,000,000 for the purchase of munitions and wheat. This was made possible by the large savings deposits in Canadian banks, which from Aug. 1914 to Oct. 31 1918, despite the withdrawals for subscription to war loans, increased by $417,115,476.

TABLE XII.—Internal Loans.

	Allotment	No. of Subscribers
1915-25 5%	$100,000,000	24,862
1916–31 5%	106,705,000	34,526
1917–37 5%	172,926,800	41,263
1917–37 (Victory Loan) 5½%	546,148,750	809,000
1918 (2nd Victory Loan) 5½%	682,256,500	1,100,000
1919 (3rd Victory Loan) 5½%	594,725,200	800,000

Soon after the outbreak of war taxes were placed on luxuries and gradually increased. Higher customs duties and rates of excise on certain commodities, including liquors and tobacco, imposed soon after the commencement of the war, were followed in 1915 by a war tax on transportation tickets, telegrams, money orders, cheques, letters, patent medicine, etc. In 1915 an increase of 7½% *ad valorem* to the general tariff and 5% *ad valorem* to the British preferential tariff was made on all commodities with the exception of certain food-stuffs, coal, harvesting machinery, fisheries, equipment, etc. In 1918 a special customs duty was imposed on tea and coffee and the excise on tobacco was increased. In addition, various other taxes were imposed or increased, and a special war excise tax was imposed on various articles, including automobiles, jewelry, etc. Under the Business Profits War-Tax Act the Government at one time, in the case of all businesses having a capital of $50,000 and over, took 25% of the net profits over 7% and not exceeding 15%, 50% of the profits over 15% and not exceeding 20%, and 75% of the profits beyond 20%. In the case of businesses having a capital of $25,000 and under $50,000 the Government took 25% of all profits in excess of 10% on the capital employed. Companies employing capital of less than $25,000 were exempted, with the exception of those dealing in munitions or war supplies.

The Canadian income-tax, which came into effect in the year 1918–9, is in some respects higher than that in force in the United States. The scale provides for the exemption of incomes in the case of unmarried persons with an income of $1,000 and under, and in the case of married persons with an income of $2,000 and under. There is also provision for the exemption of $200 for each child.

Defence.—Under the Militia Act of 1904 the command in chief of the militia is vested in the king, by whom, or by the governor-general as his representative, it is exercised and administered. The Act further provides for the appointment of a Minister of Militia and Defence, charged with the administration of militia affairs, and of a deputy minister; also for the appointment of a militia council. This includes, besides the minister and deputy minister, four military members—the chief of the general staff, the adjutant-general, the quartermaster-general, and the master-general of the ordnance. There is also an inspector-general, whose duty it is to inspect the forces and report to the minister on their readiness for war, but he has no seat in council. The Canadian land forces are divided into the active militia and the reserve militia. The active militia consists of a permanent and a non-permanent force, the latter divided into city and rural corps. Service in the active militia is voluntary and for three years, but the Government has the power to apply compulsion should the necessity arise. The permanent force comprises all arms of the service and is composed of a number of permanently embodied units. It provides personnel for the various schools of military instruction and garrisons for the fortresses, where a permanent element is necessary for defence, for the maintenance of works and for the preservation of armaments. The non-permanent active militia undergoes an annual period of training, which varies from 12 to 16 days according to the arms of the service and the location of the corps, *i.e.* whether they are city or rural. The reserve militia has not been organized. The authorized Limited Establishment for the permanent force was approximately 4,000 in 1921. The non-permanent active militia is comprised of such corps as from time to time are authorized by the governor-general in council. In pre-war days its strength was approximately 68,000.

The above organizations are supplemented by numerous cadet corps and rifle associations. The Royal Military College at Kingston provides both a military and a general education. It trains officers both for the permanent force and for the remainder of the active

militia, and a certain number of commissions in the British regular army are granted annually to its cadets.

Naval Service.—The department of the Naval Service of Canada embraces, in addition to the naval service proper, fishery protection, hydrographic surveys, tidal and current survey, radiotelegraph or wireless service and the Canadian Arctic Expedition. The naval service proper embraces one light cruiser, two torpedo destroyers and two submarines, a gift from the Admiralty of Great Britain. It also embraces the Royal Naval College of Canada and the dockyard at Esquimalt and the dockyard at Halifax. The dockyards at Esquimalt and Halifax are maintained as bases of supply and for the purpose of repair and overhaul of the ships of the fleet, as well as for the other services of the department. The principal functions of the department are thus: (*a*) to assist in the maritime defence of the Empire; (*b*) the maritime defence of Canada from attack from overseas; (*c*) the protection of Canadian fisheries; (*d*) the surveying of ocean beds, coast-lines, bays, rivers and lakes, and the preparation and distribution of charts, plans and sailing directions of the navigable waters; (*e*) the scientific investigation of tides and currents, and the prediction and determination of tide levels; (*f*) the administration of wireless telegraphy and telephony throughout the Dominion; (*g*) the completion of the Canadian Arctic Expedition.

HISTORY.—The political history of Canada in 1910-13 centred round the two great questions of Reciprocity with the United States and Canadian naval policy in relation to the Empire. On July 18 1911 Parliament reassembled after the Coronation adjournment, and on July 20 the Government of Sir Wilfrid Laurier, who had been Premier since 1896, decided to recommend the dissolution of Parliament and to submit their proposals for commercial reciprocity with the United States to the judgment of the Canadian people at a general election, which was fixed for Sept. 21. While the chief question before the electors was the Reciprocity Agreement, the question of Canada's naval policy received much attention, especially in the province of Quebec. The result was a complete defeat for the Government and the Reciprocity party. What had been a Liberal majority of 43 was converted into a Conservative-Liberal and anti-Reciprocity majority of 49. Mr. Fielding and Mr. Paterson, who were responsible for the negotiations with the United States, were both defeated, together with Sir F. Borden and four other ministers. On Oct. 6 Sir Wilfrid Laurier and his administration resigned office. Sir Wilfrid Laurier retained his seat, however, and decided to remain at the head of his party, now in Opposition.

Mr. (later Sir) R. L. Borden (b. 1854), leader of the Conservative party, being called upon to form an administration, accomplished this task on Oct. 10 1911, and the new Ministry was constituted as follows: R. L. Borden, Premier and President of the Privy Council; George Eulas Foster (b. 1847), Trade and Commerce; Robert Rogers (b. 1864), Interior; F. D. Monk (b. 1856), Public Works; Francis Cochrane (b. 1852), Railways and Canals; William T. White (b. 1866), Finance; Louis P. Pelletier (b. 1857), Postmaster-General; John D. Hazen (b. 1860), Marine and Fisheries and Naval Service; Charles J. Doherty (b. 1855), Justice; Samuel Hughes (b. 1853), Militia and Defence; William J. Roche (b. 1859), Secretary of State; Thomas W. Crothers (b. 1850), Labour; Wilfrid B. Nantel (b. 1857), Inland Revenue and Mines; John D. Reid (b. 1859), Customs; Martin Burrell (b. 1858), Agriculture; George H. Perley (b. 1857), Albert E. Kemp (b. 1858), and James A. Lougheed (b. 1854), members without portfolios. On Oct. 22 1912 Mr. Monk resigned on the question of Mr. Borden's naval policy and his portfolio was taken over by Mr. Rogers, Mr. W. J. Roche becoming Minister of the Interior in his place. The office of Secretary of State was filled by Mr. Louis Coderre (b. 1865), the member for the Hochelaga division of Montreal. On Oct. 23 1911 the Hon. Auguste Landry was appointed Speaker of the Senate, and on Nov. 15 Dr. T. S. Sproule was elected Speaker of the House of Commons.

The twelfth Parliament of the Dominion of Canada was opened on Nov. 15 1911 by the new governor-general, the Duke of Connaught, in person. The address in reply to the speech from the throne was voted on Nov. 29, and on Dec. 7 Parliament adjourned over the Christmas recess until Jan. 10 1912. On resuming, the main business was financial. On April 1 1912 Parliament was prorogued.

When the new session opened on Nov. 21 1912, it was known that the announcement of Mr. Borden's naval programme would be the business of outstanding importance. The governor-general, in the speech from the throne, stated that his advisers having consulted with the Imperial Government, it had been concluded that it would be the duty of Canada at this juncture to afford aid in strengthening the effective naval forces of the Empire; and on Dec. 5 the Premier announced an Emergency Contribution bill, leaving permanent policy for future consideration.

The Reciprocity Question.—Sir W. Laurier's Government had begun their official negotiations for Reciprocity with the United States in Jan. 1911, as the result of private discussions in the previous year. The terms of the proposed agreement were announced in the Canadian Parliament by Mr. W. S. Fielding, the Finance Minister in Sir W. Laurier's Cabinet, on Jan. 26 1911. It aimed at more free interchange of products by removing duties on certain articles and reducing them in others.

Among those which were to enter free in each country, if of the growth, product or manufactures of the other, were live animals, poultry, wheat and other grain, vegetables, fruit, dairy products, honey, cottonseed oil and certain oil seeds, grass, garden, field and other seed, fish except those preserved in oil, certain fish oils, timber (not sawn), brass (not polished), rolled iron or steel sheets 14-gauge or thinner, galvanized, coated with zinc or tin, crucible cast steel, galvanized iron, steel or wire, typewriting and typesetting machines, barbed wire fencing, coke (round), wire rods, wood pulp, and cream separators. Among the articles to be admitted into Canada from the United States and into the United States from Canada at identical rates were the following: Fresh meats 1¼ cents per lb.; bacon and hams, not in tins or jars, 1¼ cents per lb.; meats dried and preserved 1¼ cents per lb.; canned meats and poultry 20%; lards, etc., 1¼ cents per lb.; barley, malt, per 100 lb. 45 cents; cereal foods 12½ cents per 100 lb.; biscuits, wafers, cakes 25%; confectionery 32½%; farm wagons 22½%; farming implements of various kinds 15%; portable engines with boilers and traction engines for farm purposes 20%; roofing slates 55 cents per 100 ft.; cutlery, plated or not 27½%; clocks, watches, etc., 27½%; automobiles 30%. Arrangements were made for special rates of duty on a moderate scale to cover a large number of other commodities.

The case presented for the adoption of this agreement was that reciprocal trade relations had been the policy of all parties in Canada for generations, that many efforts had been made to secure a treaty without success, and that Sir John Macdonald's National Tariff policy (1870) contained a standing offer of reciprocity with the United States covering a large portion of the products included in the present agreement. The United States having approached Canada with fair offers, it was claimed that they should be fairly met, and that in making the arrangement the Government were realizing the desires which the Canadian people had expressed for half a century, and also that in promoting friendly relations with the neighbouring republic the best possible service to the Empire was being done. As Canada was seeking markets everywhere for her surplus products, subsidizing steamship lines, and sending out commercial agents, it would be absurd to refuse increased facilities at her very doors if they could be obtained by negotiation.

A denial was given to the expressed fear that the imports from Great Britain would be seriously affected. It was pointed out that the greater part of the agreement dealt with natural products which did not come from Great Britain, and that the range of manufactures affected was small. It was further denied that there was any foundation for the assumption that the tariff rates agreed upon discriminated in favour of the United States and against Great Britain. The promoters of the agreement promised that in every case Great Britain would have the same rate or a lower one, and held that Canada's right to deal with the British preference as she pleased remained untouched.

The opposition to the agreement took the ground that the arrangement had been entered into hastily without its effects being fully appreciated, and that the question should be referred to the people. Attention was drawn to the success which had attended the efforts to build up a nation and bind the country together from east to west, and it was contended that, as the arrangements proposed would primarily affect the question of transportation by promoting a tendency to make trade move north and south, the immense efforts which had been made would be sacrificed, and the markets which had been secured in Great

Britain abandoned. The action of the United States in approaching Canada with a desire to make such an agreement, after declining on so many occasions to consider the question when asked to do so by Canada, was looked upon with suspicion, and it was suggested that the balance of advantage would remain with the United States, the speeches of some of her most prominent public men being freely quoted in support of this view—notably one by Mr. Champ Clark in Congress, and another by President Taft himself. It was held that the impelling cause was the desire of the United States to have access to the abundant natural resources of Canada, her own reserves of wood, coal and other minerals, and much of her farm land, having shown signs of exhaustion. It was thought the better plan was to conserve Canadian resources for Canadian use. A further objection to the proposals was that, while they would change the whole current of Canadian industries, and be likely to dislocate the national development, the new markets proposed would be so entirely unstable and insecure that, after having had the benefit of them for a few years, they might be withdrawn, causing a reversion to the position of 25 years earlier, and necessitating the rebuilding of home industries and re-making their reputation in markets which in the meantime had been entirely occupied by old competitors. Great importance was attached to the restriction on legislation which it was alleged this agreement would cause, as no trade aggrieved under it could obtain redress without the arrangement as a whole being upset. It was also urged that under it concessions in the tariff would have to be made, in accordance with existing treaties, to countries from which no equivalent advantages could be obtained; and it was declared that if this Reciprocity policy was pursued the ties of Empire would eventually be cut, for it would lead to complete commercial union and in the end the political domination of the United States, to which Canada would simply be an annexe.

The debates in connexion with the matter lasted for almost the remainder of the session; but on Feb. 22 1911, on the motion of Mr. F. D. Monk, the House adopted unanimously the following as an amendment to the motion for going into Committee of Ways and Means: " But, before resuming the discussion of the terms of the agreement concluded between the Government of Canada and the President of the United States, and with a view to dispel the feeling of unrest created in Canada by comments made in both countries as to the political consequence of the agreement, the House wishes to affirm emphatically its determination to preserve intact the bonds which unite Canada to the British Empire and the full liberty of Canada to control her fiscal policy and internal autonomy."

A bill to give effect to this Reciprocity Agreement on the part of the United States was introduced in the American Congress on Jan. 29, and in due course passed the Senate on July 22, it being enacted that its provisions should become operative as soon as the necessary counterpart legislation had been passed by the Canadian Parliament. Discussion continued in the Canadian House of Commons, but no progress was made towards the adoption of the proposals, and on July 29 1911 the Government decided to recommend the dissolution of Parliament and to submit the matter to the judgment of the people at a general election. The defeat of the Government followed, the result being greatly influenced by the strong opposition to Reciprocity which was shown by such well-known Liberals as Mr. Clifford Sifton (b. 1861; formerly Minister of the Interior in the Laurier Cabinet), Mr. Lloyd Harris and Mr. Wm. German, and by the steps taken by a body of prominent Liberals of Toronto, assisted by Sir Edmund Walker, president of the Canadian Bank of Commerce.

Sir W. Laurier's Naval Policy.—An outcome of the Imperial Conference of 1909 had been the determination of the Canadian Government to establish a naval service; and on Jan. 12 1910 a bill for this purpose was introduced into the House of Commons, and became law on May 4 1910. It provided for the creation of a Naval Department, and transferred to it from the department of Marine and Fisheries the wireless telegraph, fisheries' protection, hydrographic and tidal survey branches. It empowered the Government to appoint a Naval Board to advise the minister, and to organize and maintain permanent, reserve and volunteer forces, and to place at the disposal of His Majesty, for general service in the Royal Navy, ships or men of the Canadian naval service. Provision was also made for a naval college. During the debate on the bill Sir Wilfrid Laurier announced that it was the intention of the Government to construct, in Canada if possible, four cruisers of the improved " Bristol " class, and six destroyers of the improved " River " class. At conferences with the British Admiralty it was agreed that the naval stations for Canada should be two—one on the Atlantic, to include the waters of 30°N. lat. and west of the meridian of 40° W.; and one on the Pacific, to include the waters north of 30° N. lat. and east of the meridian of 180°. Halifax dockyard was taken over from the Imperial authorities on Jan. 1 1906, and the dockyard at Esquimalt on Nov. 9 1910. On Aug. 28 1911 it was announced that the King had approved of the naval forces of Canada receiving the style of " The Royal Canadian Navy," and of the ships-of-war of that navy being designated as " His Majesty's Canadian Ships." On Dec. 16 the following regulations were published with regard to the flag and pennants to be flown by the Royal Canadian Navy: " All ships and vessels of the Royal Canadian Navy shall fly at the stern the white ensign as the symbol of the authority of the Crown, and at the jack-staff the distinctive flag of the Dominion of Canada, such distinctive flag being the blue ensign with the Arms of the Dominion inset in the fly. The white pennant will be flown at the masthead."

In pursuance of Sir Wilfrid Laurier's naval policy, H.M. cruisers " Niobe " and " Rainbow " were purchased and taken over in the autumn of 1910. On July 29 1911, however, H.M.C.S. " Niobe " sustained damage by grounding on the coast off Cape Sable; her repairs were undertaken at Halifax and took 15 months to complete. The building of the proposed new cruisers and destroyers had, however, not been commenced at the time of the resignation of Sir Wilfrid Laurier's Government.

Mr. Borden's Naval Policy.—The naval policy of Sir Wilfrid Laurier's Government was that of a Canadian-built and Canadian-controlled navy, but this was criticised by the Opposition as involving a large expenditure, a disunited Imperial navy, and the construction of obsolete types of ships. Upon Mr. Borden's acceptance of office, the naval question became one of renewed interest. Mr. Borden stated that in his view the question of permanent coöperation between the Dominion and the rest of the Empire ought to be fully debated and that the Canadian people should be given an opportunity of pronouncing upon it; pains would be taken to ascertain in the meantime what were the real conditions confronting the Empire. In pursuance of this object, Mr. Borden, with several of his colleagues, visited London in July 1912, and were cordially welcomed by Mr. Asquith's Government, who enabled them, at meetings of the Imperial Defence Committee and otherwise, to obtain all the information available as to the problems of British foreign policy and the naval situation as it presented itself to the British Admiralty. The proposals which the Canadian Government founded on the understanding thus arrived at were left, however, to be made public first in the Dominion Parliament after it met in November.

Mr. Borden's speech on Dec. 5 1912 must always be historic in the relationship between Canada and the mother-country. It was notable for announcing two steps forward in a common Imperial policy. In the first place his " Bill to authorize Measures for increasing the effective Naval Forces of the Empire " proposed to contribute £7,000,000 ($35,000,000) for the construction and equipment of three first-class battleships, to be under the control of the British Admiralty as part of the Royal Navy, subject to arrangements for their being at the disposal of the Canadian Government if ever a separate Canadian navy were established. And in the second place, by the agreement of the Imperial Government to include a Canadian minister as one of the permanent members of the Committee of Imperial Defence, the principle was recognized that, if the dominions took their share in Imperial defence, they must also have a share in determining Imperial policy. The proposal for an " emergency contribution " of three battleships to the British navy was founded on a memo-

randum (published in England on Dec. 5 as a parliamentary paper) drawn up by the Admiralty for the information of the Canadian Government as to the existing international situation from a naval point of view; and Mr. Borden read this out.

As regards the three Canadian battleships now to be added to the navy, Mr. Borden pointed out that, under the Admiralty, the Empire now had what he had convinced himself was the most thorough and effective naval organization in the world, of which it was the best Canadian policy to make use. The hazardous and costly experiment of building up a separate naval organization for Canada was quite unnecessary, and in any case could only provide a poor and weak substitute. In the present emergency the Canadian ships were best employed as part of the Imperial navy under the Admiralty of the mother-country:—

"Those ships will be at the disposal of His Majesty the King for the common defence of the Empire. They will be maintained and controlled as part of the Royal Navy, and we have the assurance that, if at any time in the future it will be the will of the Canadian people to establish a Canadian unit of the British Navy, these vessels can be called by the Canadian Government to form part of their Navy, in which case, of course, they will be maintained by Canada and not by Great Britain. In that event, there will, necessarily, be reasonable notice, and indeed, Canada would not desire or suggest the sudden withdrawal of so powerful a contingent from any important theatre in which the naval forces of the Empire might be exposed to severe and sudden attack. In the meantime I am assured that special arrangements will be made to give Canadians an opportunity of serving as officers in these ships. . . .

"The ships will be built under Admiralty supervision in the United Kingdom for the reason that, at present, there are no adequate facilities for constructing them in Canada. The plant required for the construction of dreadnought battleships is enormous, and it would be impossible at present to have shipbuilding in this country on such a scale. In any case, only half could be built in Canada, because the machinery for armour and guns would, necessarily, be constructed or manufactured in the United Kingdom. The additional cost of construction in Canada would be about $12,000,000 for three, and it would be impossible to estimate the delay. No one is more eager than myself for the development of the shipbuilding industries in Canada, but we cannot, upon any business or economic considerations, begin with the construction of dreadnoughts, and especially we could not do so when these ships are urgently required within two or three years at the outside for rendering aid upon which may depend the Empire's future existence. According to my conception, the effective development of the shipbuilding industries in Canada must commence with small beginnings and in a businesslike way. I have discussed the subject with the Admiralty, and they thoroughly realize that it is not to the Empire's advantage that all shipbuilding facilities should be concentrated in the United Kingdom. I am assured, therefore, that the Admiralty are prepared in the early future to give orders for the construction in Canada of small cruisers, oil-tank vessels, and auxiliary craft of various kinds. The plant required is relatively small as compared with that which is necessary for dreadnought battleships, and such an undertaking will have a much more secure and permanent basis from the business standpoint. For the purpose of stimulating so important and necessary an industry we have expressed our willingness to bear a portion of the increased cost for a time at least. I see no reason why all the vessels required in future for our Government service should not be built in Canada, even at some additional cost. In connexion with the development of shipbuilding I would not be surprised to see the establishment of a high class of engineering works which will produce articles now imported and not at present manufactured in Canada. Therefore, although the sum which we propose to devote for necessary naval aid at this critical juncture is to be expended in Great Britain, yet we believe that this step will result, under the conditions which I have described, in the very marked development of more than one industry in Canada, and that, even from a purely material standpoint, the step has much to commend it."

The Canadian expenditure now proposed was, in Mr. Borden's view, a moderate one, regarded not as the beginning of a system of periodical contributions, but as an emergency aid at a moment of crisis:—

"If we should neglect the duty which I conceive we owe to ourselves, and if irreparable disaster should ensue, what will be our future destiny? Obviously as an independent nation or as an important part of the great neighbouring republic. What then would be our responsibilities, and what would be the burden upon us for a protection on the high seas much less powerful and less effective than that which we enjoy to-day? Take the case of one nation whose territory, resources, population and wealth may fairly be compared with those in Canada. The naval estimates of Argentina for the four years from 1909 to 1912 inclusive amounted to $35,000,000 (£7,000,000). No information is available as to the exact proportion of the last-mentioned sum which has been appropriated for naval purposes, but it is understood that the far greater portion is for naval construction. It is safe, therefore, to estimate that during the past four years Argentina has expended for naval purposes not less than from $65,000,000 to $70,000,000 (£13,000,000 to £14,000,000). The Federal and State expenditure of the United States comprises a total outlay for armaments of between $250,000,000 and $300,000,000 (£50,000,000 and £60,000,000), or at the rate of $2.75 per head. Similar expenditure by Canada would mean an annual outlay of some $20,000,000 to $25,000,000, or between $80,000,000 and $100,000,000 during the same period.

"It is apparent, therefore, that the aid which we propose to bring at this juncture is of a moderate and reasonable character. For 45 years as a Confederation we have enjoyed the protection of the British Navy without the cost of a dollar. . . . So far as official estimates are available, the expenditure of Great Britain on naval and military defence for the provinces which now constitute Canada during the 19th century was not less than $400,000,000 (£80,000,000). Even since the inception of our Confederation, and since Canada attained the status of a great Dominion, the amount so expended by Great Britain for the naval and military defence of Canada vastly exceeds the sum which we are now asking Parliament to appropriate. From 1870 to 1890 the proportionate cost of the North Atlantic Squadrons which guarded our coasts was from $125,000,000 to $150,000,000 (£25,000,000 to £30,000,000). From 1853 to 1903 Great Britain's expenditure on military defence in Canada runs closely to $100,000,000."

As regards the voice which it had been arranged that Canada should have on the Committee of Imperial Defence, Mr. Borden said:—

"With increasing power and influence there has necessarily come, by sure and gradual steps, a certain development in our relations with the United Kingdom and the other dominions. . . . In this constitutional development we are necessarily confronted with the problem of combining coöperation with autonomy. It seems most essential that there should be such coöperation in defence and in trade as will give to the whole Empire an effective organization in these matters of vital concern. On the other hand, each dominion must preserve in all important respects the autonomous Government which it now possesses.

"The responsibility for the Empire's defence upon the high seas, in which is to be found the only effective guarantee of its existence, and which hitherto has been assumed by the United Kingdom, has necessarily carried with it the responsibility for and the control of foreign policy. . . . When Great Britain no longer assumes sole responsibility for defence upon the high seas she can no longer undertake to assume responsibility for and sole control of foreign policy, which is closely, vitally, and constantly associated with that defence in which the dominions participate. . . . The great dominions, sharing in the defence of the Empire upon the high seas, must necessarily be entitled to share also in the responsibility for and in the control of foreign policy. Not only His Majesty's ministers, but also the leaders of the opposite political party in Great Britain, have explicitly accepted this principle. . . .

"I have alluded to the difficulty of finding an acceptable basis upon which the great dominions coöperating with the mother-country in defence can receive and assert an adequate voice in the control and moulding of foreign policy. We were brought closely in touch with both subjects when we met the British ministers in the Committee of Imperial Defence. That committee is peculiarly constituted, but in my judgment is very effective. It consists of the Prime Minister of Great Britain and such persons as he may summon to attend it. Practically all the members of the Cabinet from time to time attend its deliberations, and usually the more important members of the Cabinet are present. In addition, naval and military experts and the technical officers of the various departments concerned are in attendance. A very large portion of the work of the Committee is carried on by sub-committees, which often are composed in part of persons who are not members of the general committee itself, and who are selected for their special knowledge of the subjects to be considered and reported upon. The amount of work which thus has been performed during the past five or six years in particular is astonishing, and I have no doubt that it has contributed largely to the safety of the whole Empire in time of peril.

"The Committee is not technically or constitutionally responsible to the House of Commons and thus it is not supposed to concern itself with policy. As so many important members of the Cabinet are summoned to attend the Committee, its conclusions are usually accepted by the Cabinet and thus command the support of the majority of the House of Commons. While the Committee does not control policy in any way and could not undertake to do so as it is not responsible to Parliament, it is necessarily and constantly obliged to consider foreign policy and foreign relations for the obvious reason that defence, and especially naval defence, is inseparably connected with such considerations.

"I am assured by His Majesty's Government that, pending a final solution of the question of voice and influence, they would welcome the presence in London of a Canadian minister during the

whole or a portion of each year. Such minister would be regularly summoned to all meetings of the Committee of Imperial Defence and be regarded as one of its permanent members. No important step in foreign policy would be undertaken without consultation with such representative of Canada. This means a very marked advance both from our standpoint and from that of the United Kingdom. It would give us the opportunity of consultation and therefore influence which hitherto we have not possessed."

In opposition to the Government proposals, Sir Wilfrid Laurier on Dec. 12 moved an amendment which, while not negativing the first clause of the Government resolution providing for a vote for increasing the effective naval forces of the Empire, would have substituted for the remaining clauses a resolution declaring it necessary that Canada without further delay should enter actively upon a permanent policy of naval defence, and that any measure of aid to Imperial naval defence which did not embody a permanent policy of participation by ships owned, manned and maintained by Canada, was not an adequate expression of the aspirations of the Canadian people. Mr. Borden, said Sir Wilfrid, had asserted that before she enacted a permanent policy Canada must have a voice in all questions affecting war or peace. But that was a large contract, and the question before them was that of emergency and immediate defence. If Canada was represented in the councils of war and peace, the other dominions and dependencies must be also. That question might take years to solve. It must be discussed by itself, and in the meantime Canada should continue in her preparations for defence. Sir Wilfrid Laurier condemned the Government's policy of direct contribution as un-Canadian and un-British, and as unsuited to the real needs. But his influence was no longer in the ascendant.

Owing to the outbreak of the World War in 1914, all these pre-war plans were eventually upset, and the war created an entirely new situation.

Canada in the World War.—In the early months of 1914 Canada, for practical purposes, had no army. There was a permanent force of about 3,000 men, with no reserve; its purpose was partly to provide garrisons for a few fortresses, and partly to train the militia. The latter was a lightly trained force, rather well organized for a defensive war on its own soil. The number trained in 1913 was about 60,000. In the late summer and early autumn of 1914 the 1st Canadian Div. of 33,000 men was raised and sent across the Atlantic. It left Gaspé Bay on Oct. 3, and, after nearly three months of additional training in England, landed in France, at St. Nazaire, on Feb. 11 1915. The 2nd Div. was formed immediately and landed in France on Sept. 14, when the Canadian Army Corps was formed. The formation of the 3rd Div. was authorized just before Christmas 1915, and the division was in France early in 1916. The 4th Div. joined the Canadian Corps in the middle of Aug. 1916. The Canadian Cavalry Brigade appeared in France in 1915. After the completion of the Canadian Army Corps the policy of the Dominion was to maintain a comparatively small number of divisions, but always to keep these at full strength, in order that the troops might have the encouragement of full ranks. Until the winter of 1917–8 the Canadian Expeditionary Force was recruited by voluntary enlistment. During the winter the Military Service Act came into operation, and after that time 83,355 recruits were obtained. These were partly men who were drafted and partly men, in the classes called out, who reported voluntarily.

The total number of men enlisted in Canada from the beginning of the war to Nov. 15 1918 was 595,441. The details are:—

Obtained by voluntary enlistment		465,984
Drafted or reporting voluntarily after the Military Service Act came into force		83,355
Granted leave or discharged		24,933
Overseas Service other than C.E.F.:—		
Royal Air Force	12,902	
Imperial Motor Transport	710	
Inland Water Transport	4,701	
Naval Service	2,814	
Jewish Palestine Draft	42	
		21,169
		595,441

The distribution of these men was as follows:—

C.E.F. proceeded overseas	418,052
Enlisted for Royal Air Force, etc.	21,169
On the strength of C.E.F. in Canada and St. Lucia, including those under training as overseas reënforcements, Siberian Expeditionary Force, Canadian Garrison Regiment, Military Police Corps, Medical and Administrative Services, etc.	36,533
On harvest leave without pay	15,405
Granted leave of absence without pay as compassionate and hardship cases	7,216
Number discharged in Canada who had not proceeded overseas for the following among other reasons: as below medical standard, absentees, aliens, to accept commissions, deaths, on transfer to British army and Royal Air Force	95,306
Included in enlistment returns for whom discharge documents have not been received, or in some cases duplicate enlistments. This number is being adjusted as further records are received	1,760
	595,441

In addition to the above, 14,590 British and Allied reservists went from Canada to rejoin the colours in their own countries. The movement overseas by years was as follows:—

Before Dec. 31 1914	30,999
Calendar year 1915	84,334
" " 1916	165,553
" " 1917	63,536
Jan. 1 to Nov. 15 1918	73,630

On Sept. 30 1918 about 160,000 men were in France and about 116,000 men in England.

The total Canadian casualties up to and including Feb. 28 1921 were 210,096:—

	Officers	Other ranks	Total
Killed in action and died of wounds	2,595	49,079	51,674
Died of other causes	297	4,663	4,960
Wounded	6,347	143,385	149,732
Prisoners of war	236	3,493	3,729
Still missing	--	1	1
	9,475	200,621	210,096
Died in Canada	—	—	3,569
Died in Siberia	1	18	19
Wounded in Siberia	—	1	1
Deaths in Canada on the strength of the Soldiers' Reëstablishment	—	—	2,005

The honours gained by the Canadian forces included 62 V.C.'s, 710 D.S.O.'s and 2,885 M.C.'s.

The following summary gives only the more notable engagements in which the Canadian troops fought. The Canadian Army Corps in four divisions, forming part of the I. British Army under Sir Julian (later Lord) Byng, was commanded by Lt.-Gen. Sir Arthur Currie. In 1915 the 1st Division greatly distinguished itself in the second battle of Ypres on April 22, and again at Festubert and Givenchy in May and June. In 1916 the Canadians, now forming three divisions, were very heavily engaged at St. Éloi in April, and at Sanctuary Wood and Hooge in June. In Sept., Oct., and Nov. the four Canadian divisions fought in the battle of the Somme, especially distinguishing themselves at Courcelette, Mouquet Farm, and the Kenora, Regina and Désiré trenches. In 1917 the Canadian troops bore the largest part in the taking of Vimy Ridge (April 9) and of Arleux and Fresnoy (April 28 and May 3), and fought with great success in the advance on Lens and the taking of Hill 70 in August. They were again heavily engaged in the fighting round Passchendaele in Oct. and Nov., capturing all their objectives in spite of severe losses. In 1918 the Canadian cavalry, motor machine-guns, and railway troops were active in the resistance to the German advance in March. The Canadian Corps was in the centre of the British front in the second battle of Amiens, Aug. 8–17, advancing 14,000 yd. on the first day, the deepest advance made in one day during the war. In the battle of Arras, at the beginning of Sept., the Canadians played an important part in the breaking of the Quéant–Drocourt line, a part of the Hindenburg system. The Canadian casualties in these two actions were serious, but less than the number of prisoners taken. In the battle of Cambrai, which began on Sept. 27, the Canadians on Oct. 9, after heavy

losses, took Cambrai and made large captures of men and material. In the final stage of the fighting Denain was taken by the Canadians on Oct. 20, Valenciennes on Nov. 2, and Mons at 4 A.M. on Nov. 11, the day on which the Armistice came into force at 11 A.M. The Canadian troops captured 45,000 prisoners, 850 artillery guns, and 4,200 machine-guns, retook 130 towns and villages, liberated 310,000 French and Belgian civilians. Canadian units also served in Palestine, Macedonia and Russia.

The Canadian cavalry fought, for the most part, separately from the Canadian Army Corps. They distinguished themselves in March 1917 by the capture of six villages in two days, and in Dec. gave valuable help in the attack on Villers-Guislains. In the German offensive of March and April 1918 the Canadian Cavalry Brigade was actively engaged and suffered heavy casualties at Bois Moreuil, Rifle Wood and elsewhere. The brigade fought as part of the Canadian Corps in the second battle of Amiens, and, in the great advance at the end of the fighting, captured the town of Le Cateau on Oct. 9. Canadian railway units were attached to all the British armies; these troops were responsible for the whole of the construction of light railways and 60% of the standard-gauge railways in the area occupied by the British forces. In addition to the units of the Canadian Forestry Corps in France, a number of Canadians were engaged in Great Britain in cutting and milling timber.

During the war 1,617 medical officers, 2,002 nursing sisters and 12,382 other ranks of the Canadian Army Medical Corps went overseas from Canada. There were in Canada at the end of the war 913 medical officers, 527 nursing sisters, 182 V.A.D. nurses, and 4,012 other ranks. The Medical Corps had in France 6 general hospitals, 6 stationary hospitals, 6 casualty clearing stations, and 13 field ambulances, and in England 9 active treatment hospitals, 5 special hospitals, 5 convalescent hospitals, and a special sanatorium. In Canada there were 65 military hospitals, with 11,786 beds. Some 22,300 patients were brought back to Canada in 1917 and 1918 on 35 passages of hospital ships. On 27 of these passages the C.A.M.C. provided the staffs of the ships. The "Llandovery Castle" was sunk by a submarine while returning from Canada to England.

About 12,000 troops were required in Canada for home defence—as garrisons for fortresses and guards for internment camps, canals, etc. Canada also furnished a garrison for the important post of St. Lucia in the West Indies. There were 12,902 Canadians in the Royal Air Force, and its predecessors the Royal Naval Air Service and the Royal Flying Corps. In addition, a number of Americans were trained in Canada by the instructional staff of the Royal Air Force. Some 4,701 men were furnished from Canada for the Imperial Service known as the Inland Waterways and Docks. About 710 Canadians joined the Imperial Motor Transport Service, and several hundred Canadians, mostly from the universities, received commissions in the British army. Canada also furnished several hundred doctors and veterinarians and about 200 nurses to the British army. Some 200 Canadian officers were lent, as instructors, to the United States.

As regards the naval service, at the outbreak of the war in 1914 the Canadian Government possessed only two naval vessels—the "Niobe," a cruiser of 11,000-tons displacement, with a main armament of 16 6-in. guns, stationed at Halifax, and the "Rainbow," a small cruiser of 3,600-tons displacement, armed with 2 6-in., 6 4·7-in. and 4 12-pounder guns, stationed at Esquimalt, on the Pacific. The "Rainbow," which was ready for sea, patrolled, with other ships on the Pacific stations, as far south as Panama, and captured several ships carrying contraband of war. After the entry of the United States into the war she became depôt-ship on the Pacific coast. The "Niobe" was made ready for sea in Sept. 1914 and remained in commission one year, during which she steamed over 30,000 m. on patrol duty. She afterwards became depôt-ship at Halifax.

At the beginning of hostilities various small craft were taken over by the Naval Department from the Departments of Marine and of Customs, and were armed and manned by the R.C.N.V.R. for the performance of patrol duties off the Atlantic coast. Two submarines, which were bought just before the declaration of war patrolled the approaches to Victoria and Vancouver and helped in keeping Adml. von Spee's squadron away from the Pacific ports. H.M. sloop "Shearwater" was taken into the Canadian service as mother-ship to these submarines and, in the summer of 1917, these three vessels went, by way of the Panama Canal, to Halifax. A patrol and mine-sweeping service was carried on after the outbreak of war. The vessels used at first were Government and privately owned vessels which were taken over and equipped for the purpose. Some of these were placed at the disposal of the Government free of charge. Early in 1917 the Department of Naval Service undertook to have 60 trawlers and 100 drifters built in Canada for the Imperial Government. These vessels were built at various places on the St. Lawrence and the Great Lakes, many of them were in service in Canadian and European waters in the year 1917 and all were in service in 1918. The area patrolled under the Department stretched from the Straits of Belle Isle to the Bay of Fundy, and from Quebec to east of the Virgin Rocks. Within this area the Department had control of patrols, convoys, mine-sweeping, the protection of fishing fleets, etc. Only one large vessel was lost by enemy attack.

At the date of the Armistice the vessels in the Canadian naval service were as follows. In the Pacific: H.M.C.S. "Rainbow," depôt and training ship; H.M.S. "Algerine," sloop; auxiliary patrol ship "Malaspina"; several motor-launches for harbour defence. In the Atlantic: H.M.C.S. "Niobe," depôt and training ship; H.M.C.S. "Shearwater," submarine depôt ship, and 2 submarines; H.M.C.S. "Grilse," torpedo-boat destroyer; 9 auxiliary patrol ships, 47 armed trawlers, 58 armed drifters, 11 armed minesweepers and tugs, and a large flotilla of motor-launches. The crews of these vessels consisted of men from all parts of Canada, principally members of the Royal Canadian Naval Volunteer Reserve. At the date of the Armistice the personnel of the service was: officers and men of the Royal Canadian Navy, 749; officers and men of the Royal Canadian Naval Volunteer Reserve, 4,374.

In addition to the men serving in Canadian vessels, over 1,700 men were recruited in Canada for the Imperial navy, 73 surgeon probationers and a number of hydrographic survey officers were sent from Canada and 580 Canadians enrolled as probationary flight lieutenants in the Royal Naval Air Service, before recruiting for the Royal Air Force began in Canada. More than 500 Canadians holding commissions in the Royal Naval Volunteer Reserve were in the British Auxiliary Patrol and similar services.

The Royal Canadian Naval Air Service was established in the summer of 1918, with stations at Halifax and North Sydney. It coöperated with the U.S. Naval Aviation Corps in patrolling the coast and escorting convoys through the danger zone.

The Canadian Radiotelegraph Service controlled about 200 stations ashore and afloat. Several new stations were erected or taken over by the Department of Naval Service, and there was an unbroken chain of radio communication from St. John's, Newfoundland, to Demerara. The Department opened a training school for wireless operators, from which about 200 men were sent out for service in all parts of the world.

Important refitting, repairing and supply work was done by the Canadian dockyards. Large refits of Imperial and other ships were made at Esquimalt, including H.M.S. "Kent" after the battle of the Falkland Is., and the Japanese battleship "Asama," after grounding on the coast of Lower California. Several large cruisers were refitted at Halifax and Montreal. Other work included the defensive armament of merchant ships, the refitting of transports for troops, horses and special cargo, and the loading and securing on ships' decks of 600 large launches, tugs, etc.

The Canadian Naval Service provided supplies for the ships of the Royal Canadian Navy and for a number of Imperial and Allied ships in Canadian waters, as well as many of the requirements of H.M. dockyards at Bermuda and Hong-Kong. Large supplies were shipped from Halifax dockyard for provisioning the fleets in European waters. A large coaling depôt was established at Sydney for the use of patrolling vessels and of all convoys leaving the St. Lawrence.

In shipbuilding Canada had a splendid war record. Nearly 1,000 vessels of one kind or another were turned out for the vari-

ous Allied Governments, these including steel and wooden freighters, submarines, coastal patrol boats, lighters, drifters, etc. During the war period not only was wooden shipbuilding revived but the steel shipbuilding industry was placed firmly on its feet; for whereas in 1914 Canada had only two thoroughly up-to-date steel shipbuilding plants, in 1918 she had seventeen. In 1919 25,000 men were employed in the industry. The Department of Naval Service secured many of the first of these orders.

The Imperial Munitions Board, acting as the agent for the Imperial and Allied Governments, placed contracts with Canadian yards for $70,000,000 worth of shipping. In 1918 the Dominion Government, through the Department of Marine and Fisheries, launched its shipbuilding programme, which in its entirety called for 63 steel vessels having a deadweight tonnage of 375,000, constituting its own mercantile marine. The approximate value of these orders was $75,000,000. The first contract was signed on March 4 1918. All these vessels were built in Canadian yards and of Canadian material.

Canada became thoroughly and quickly organized for carrying on the war in all its phases. There were a number of committees, commissions, boards, etc., formed for various purposes, the members of which worked voluntarily. These were the Shell Committee, the Imperial Munitions Board (which had a wide scope of usefulness and responsibility), War Trade Board, Board of Grain Supervisors, War Mission to Washington, the Food Board (under the direction of a food controller), Fuel Control (under the direction of a fuel controller), and the Canadian Railway War Board.

Canadians gave liberally to all the organizations engaged in relief and help of any kind. The following is a summary of gifts for various war purposes from the Dominion and Provincial Governments, from municipalities, societies, universities, business houses and other corporations, and from private individuals:—

Canadian Patriotic Fund (to Feb. 28 1921)	$48,704,663
Manitoba Patriotic Fund (to March 31 1918)	3,957,042
Canadian Red Cross Society (to Dec. 31 1920):—	
Contributions in cash	9,074,208
Gifts in supplies (estimated)	15,000,000
British Red Cross Society (to Dec. 31 1919)	6,250,000
Belgian Relief Fund (to Dec. 19 1918):—	
Contributions in cash	1,642,104
Gifts in supplies (estimated)	1,512,800
Contributions from Canada to Y.M.C.A. for military work	4,574,821
Gifts from Dominion and Provincial Governments to Government of United Kingdom	5,469,316
Miscellaneous gifts	8,000,000
Total	$104,184,954

Of the various war organizations working in Canada, or among Canadian troops overseas, the most extensive in their operations were the Canadian Patriotic Fund, the Canadian Red Cross Society, and the military branch of the Y.M.C.A. The Canadian St. John Ambulance Association and Brigade, which were branches of the Order of St. John of Jerusalem in England, coördinated their war work with the Canadian Red Cross Society. The Association during the five years of the war instructed 61,612 Canadians in first aid and home nursing, for volunteer work either in Canada or overseas. In addition courses in first aid were given to 200,000 troops while in training in Canada.

Statistics, however complete, can give only an imperfect impression of the services which Canadian women rendered during the war. Women to the number of 2,400 went overseas in the C.E.F. and served in England, France, Belgium, Egypt, Greece and Russia. They were posted for duty in base hospitals, clearing stations, ambulance trains and hospital ships. There were also 527 on duty in Canada.

The casualties suffered by nurses were:—

Killed in action	2
Died at sea	13
Died of wounds	5
Died of disease (out of Canada)	17
Died in Canada.	17

The number of V.A.D.s who went overseas was 342; these served in hospitals in England and France. Many hundreds of Canadian women served in Canada as volunteer hospital probationers in military hospitals and in England, under the Joint War Committee's Women's V.A.D. Department.

Returned Soldiers.—Some time before the close of the war provision was made by the Government by repeated Acts for the care of the returned soldiers. The Military Hospitals Commission was appointed in June 1915. It provided 16 hospital cars and had hospital accommodation at the commencement of 1917 for 1,500 patients. It provided during 1917 10,000 beds in 40 centres. Vocational training for disabled men was organized in 1916. The number who commenced courses was 50,521, those who completed 36,826, and those who discontinued 8,081. In Feb. 1918 a Department of Soldiers' Civil Reëstablishment was organized to take over the work of the Hospitals Commission. An arrangement was made for the treatment of all invalided soldiers returned except those suffering from tuberculosis, epilepsy, paralysis, insanity and mental deficiency, which came directly under the D.S.C.R. The total of clinical treatments was 586,185. The information and service branch in connexion with the Department placed in employment 101,000 men. The number of situations found was 174,780. The pension branch rendered a most important service in connexion with permanently maimed soldiers, widows, mothers and children of soldiers who were killed. The total number to whom pensions were awarded was 110,702, and the aggregate of pensions paid to Dec. 1920 amounted to $81,659,636. The number of pensions in force at the end of 1920 was 73,620, and the amount in force on that date was $31,169,520. At various times from 1914 to 1920 the rate of pensions was substantially increased. For instance in 1914 the rate per annum for disability was $264, and in 1920 it was $900, with $300 for the wife, $180 for one child and a lesser amount for subsequent children. The annual rate for dependents of deceased soldiers increased practically in the same proportion. In addition to pensions, war service gratuities were paid to the amount of $164,000,000. Added to the pension system was a provision made for Government insurance of returned soldiers, including naval and air forces. The amount of insurance in force in 1921 was $5,225,000. Applications received amounted to 1,705.

The Soldier Settlement Act made provision for the settlement of returned soldiers on the land. It empowered a board consisting of three members to make a soldier grant of 160 ac. of Dominion land in the Western Provinces, and returned men were also eligible for a civilian homestead of another 160 acres. The Act also empowered the board to make loans to enable returned men to settle in any province. Loans might be granted up to $7,500 to qualified settlers purchasing land through the board, the settler to pay down 10% of the cash value of the land; up to $3,000 for equipment and improvements, and up to $5,000 to settlers who already owned land to enable them to pay off old mortgages and to purchase live stock and implements and to erect buildings. Up to March 31 1921 the board received 50,331 applications: 43,063 were granted certificates; 25,443 had gone on the land, 10,771 of whom received financial assistance amounting to $80,371,750.48. The total area of land occupied by soldier settlers under the Act was 4,854,709 ac.—purchased land 2,153,184 ac., encumbered land 360,227 ac., soldier grants (with loans) 980,108 ac., soldier grants (without loans) 1,361,280 acres. The value of the main crops produced by soldier settlers in 1920 was $13,953,178.

The following figures show the number of loans approved and the amounts by provinces:—

Province	Number of Loans Appr'ed	Total Amount of Loans Approved
Prince Edward Island	304	$ 819,507
Nova Scotia	399	1,310,049
New Brunswick	522	1,487,680
Quebec	456	1,903,340
Ontario	1,423	6,163,808
Manitoba	3,311	13,420,640
Saskatchewan	4,963	20,319,360
Alberta	5,790	23,233,342
British Columbia	2,954	12,697,222
	20,122	$81,354,948

These loans were for the following purposes:—

To purchase land	$44,463,951
To remove encumbrances	2,213,897
For permanent improvements	9,408,394
For stock and equipment	25,268,706
	$81,354,948

The Dominion Government also appropriated the sum of $25,000,000 for housing in Canada. The object of the Government was to provide houses for working-men, particularly returned soldiers, at the actual cost of building and land acquired at a fair value, thus eliminating the profits of the speculator.

After the War.—One result of the war was that Canada, along with other dominions, acquired a substantially new status in the Empire. Sir Robert Borden, as Canadian Prime Minister, was a member of the Imperial War Cabinet. Members of the Canadian Government attended the Peace Conferences, signed the Peace Treaties, and were members and participated in the deliberations of the League of Nations. Finally it was decided that Canada should be represented at Washington by a Canadian ambassador, distinct from, and with responsibilities quite apart from those of, the British ambassador.

During the war a general election had taken place on Dec. 17 1917, the Unionist Government under Sir R. Borden being opposed by the Laurier Liberals, the result being the return of 150 Unionists and 80 Opposition members. After the signing of the Armistice a certain number of the Liberals elected as Unionists to support the Government returned to the Liberal side of the House in Opposition. As the result of by-elections, representatives of the Farmers' party were also elected and sat upon the cross-benches, which included several former Liberals from the Middle West. At the close of the 1920 session of Parliament the Unionist party by that name ceased to exist, and there was formed the National Liberal and Conservative party, with a policy strongly protective in principle. In Aug. 1919, as the result of the death of Sir W. Laurier (Feb. 17 1919), a huge convention of Liberals was held at Ottawa to select a leader in succession to him, and to frame a platform. After an exciting contest of several days the Hon. William Lyon Mackenzie King was elected, and a fiscal policy was approved in favour of free imports of all foodstuffs and implements of production.

On March 21 1921, Sir Robert Borden having resigned the premiership, Mr. Arthur Meighen (b. 1874), as his successor in the Conservative leadership, was called upon to form a government. It included Sir George E. Foster as Minister for Trade and Commerce. Mr. Meighen subsequently attended the Imperial Conference in London in July 1921. But he and his party, standing on a high tariff platform, were heavily defeated at the general elections on Dec. 6. For the first time in Canada, women exercised the vote. The Liberal party, under Mr. King, were returned 121 strong, the Conservatives numbering only 51, the Progressives (under Mr. T. A. Crerar) 60, and Independents 2. The result was a victory for the Liberal policy of a tariff for revenue only, with British preference, but with reciprocity as regards the United States. Mr. Mackenzie King (b. 1874), who had been Minister for Labour for eight years under Laurier, thus found himself at the head of a clear majority over all other parties.

Lord Jellicoe and the Canadian Navy.—In pursuance of instructions from the Lords of the Admiralty to advise the Dominion in respect of a scheme of naval defence, Lord Jellicoe visited Canada in 1919 and his report was issued early in 1920. On June 14 1920 the Hon. C. C. Ballantyne made an official statement of policy in the Canadian House of Commons. He stated that the Government had not yet decided on a permanent programme, and would not so decide until after the matter had been discussed by an Imperial Conference and a decision had been arrived at by Great Britain on an Imperial naval policy. In the meantime the Canadian navy would be maintained on pre-war lines. The offer by the Imperial Government of one light cruiser and two torpedo-boat destroyers to take the place of the obsolete training ships, the "Niobe" and the "Rainbow," had been accepted. To make way for reorganization, it had been decided to demobilize all officers and naval ratings, discontinue certain civilian help at headquarters and at the naval dockyards at Esquimalt and Halifax, to recall all officers with the Imperial fleet and place them in the Canadian service, and to continue the Naval College.

Prince of Wales' Visit, 1919.—The year 1919 was made notable by the visit of the Prince of Wales. King Edward VII., as Prince of Wales, had visited Canada in 1860, and King George V., in the same capacity, in 1901. This tour of the Prince of Wales in 1919, however, was the most extensive ever made by any member of the royal family. He arrived in St. John's, Newfoundland, on Aug. 12, and from Aug. 15 to his departure for England from Halifax on Nov. 25 he visited every part of Canada accessible by railway communication from the Atlantic to the Pacific, being welcomed with the greatest enthusiasm everywhere; and in the course of his visit the Prince laid the corner-stone of the tower of the new Parliament Buildings at Ottawa.

Prohibition.—After the commencement of the World War all the Canadian provinces took steps toward the prohibition of intoxicants or the severe restriction of their use, as a war measure, to be effective during the period of the war. In British Columbia this was brought about by the submission of a referendum in the form of a statute. In other provinces prohibition measures were the results of direct action by the Legislatures. New Brunswick, Nova Scotia and Prince Edward I. had been largely "dry" before the war under the local option provisions of the Canada Temperance Act, but these, too, tightened up the existing law by provincial measures. In nearly every instance the purchase of liquors, with the exception of very light beer, where the sale of this was permitted, was possible only through medical prescription, and liquors were only available at drug-stores or Government shops. In Quebec a bill introduced in 1918 provided for total prohibition on May 1 1919. A subsequent bill of 1919 retained all the clauses of the Act of 1918, except in respect of the sale and use of beer and light wines, which were subject to a referendum, the result of which was: in favour, 178,112; against, 48,433. In the four western provinces much complaint was made by prohibitionists of the laxity of enforcement, which was admitted in official quarters to be a matter of great difficulty, and a discussion arose in all the provinces as to the advisability of restrictive measures of the nature then in force. On the prohibitionist side it was urged that more stringent laws should be enacted and better machinery provided for enforcement. On the other, the "moderation" side, Government control was advocated. An appeal was made to the Dominion authorities to prevent manufacture and the export and import as among provinces. Two provinces, British Columbia and Quebec, declared for Government control, and in both that system became effective. The Government of Canada endeavoured through the House of Commons to restrict the manufacture, transportation and importation of liquors during the war and for 12 month thereafter, but the measure was defeated in the Senate and abandoned. A subsequent law was enacted leaving the matter in the hands of the various provinces, as the result of referenda.

By statute assented to on Nov. 10 1919 provision was made for taking, at the request of any provincial legislature by resolution, a vote in the province upon the question whether the importation of intoxicating liquor therein should be prohibited, and the machinery for such votes, previously defective, was improved in 1920 by another statute, assented to on July 1 1920. Proclamations were at once issued directing votes to be taken on Oct. 25 following in the provinces of Nova Scotia, Manitoba, Alberta, Saskatchewan, and Ontario. These votes resulted as follows:—

	For	Against
Nova Scotia	83,422	23,874
Manitoba	68,831	55,056
Alberta	63,012	44,321
Saskatchewan	86,949	55,259
Ontario	540,773	373,938

The Yukon territory in June 1921 carried a referendum in favour of sale of intoxicants under Government control. It had previously been "dry."

Viceroys.—As governor-general of Canada Earl Grey had been succeeded in 1911 by the Duke of Connaught, who in turn was

succeeded by the Duke of Devonshire in 1916; and when the Duke of Devonshire's term expired on July 18 1921, he was succeeded by Gen. Lord Byng of Vimy. (W. L. G.*)

Canadian Literature

English-Canadian.—The literary record of Canada in 1910–21 falls more or less definitely into three sections—pre-war, war and post-war. During the war years the heart of the Canadian people became so completely absorbed in the great conflict, in which they had so much at stake, that, after the first year or so at any rate, there remained little room for any intellectual activity not connected directly or indirectly with the war and its successful prosecution. The new literature of 1910–14 had reflected the characteristic of the Dominion in those years—a spirit of optimism, of national self-consciousness, of conservatism in the broader sense, and intellectually of wider and more stimulating horizons. And the return to peace conditions, during 1918–21, was mainly notable in literature for more or less thoughtful reviews of Canada's part in the war, consideration of her problems of reconstruction, and the picking up anew of the somewhat neglected threads of her intellectual life.

Unquestionably the most important achievement of the pre-war period was the publication of *Canada and its Provinces*, a comprehensive survey of the history of the country in 23 volumes, edited by Dr. A. G. Doughty and Dr. Adam Shortt, and counting among its contributors most of the recognized authorities in Canadian history, biography and economics. Another notable essay in Canadian history was the series known as the *Chronicles of Canada*, in 32 volumes, edited by George M. Wrong and H. H. Langton, a series designed to present in attractive and at the same time authoritative form the outstanding events of Canadian history. The authors of the individual volumes included such well-known writers as Charles W. Colby, of McGill University, Col. William Wood, Stephen Leacock, Dr. Doughty, Oscar D. Skelton, of Queen's University, and Sir Joseph Pope. The publication in 1911 of an *Index and Dictionary of Canadian History* completed the series of biographies known as *The Makers of Canada*.

The celebration of the tercentenary of the founding of Quebec brought in its train, with a flood of purely ephemeral literature, several books of permanent value, such as *The King's Book of Quebec* (1911), edited by Dr. Doughty and Col. Wood, James Douglas' *New England and New France* (1913), Wood's *In the Heart of Old Canada* (1913), and Prof. Wrong's *The Fall of Canada* (1914). In 1920 the Hudson's Bay Company celebrated its 250th birthday with elaborate pageants in Winnipeg and elsewhere throughout the West. The occasion was also marked by the publication of a very completely illustrated history of the Company. In 1921 McGill University celebrated the 100th anniversary of its charter.

This period also witnessed a succession of biographies and autobiographies of famous Canadians, including Beckles Willson's *Lord Strathcona* (1914) and W. T. R. Preston's pungent life of the same many-sided character, Sir Richard Cartwright's *Reminiscences* (1912), Sir George W. Ross' *Getting into Parliament and After* (1913), L. J. Burpee's *Sir Sandford Fleming* (1915), John Boyd's *Sir George Etienne Cartier* (1914), Sir Charles Tupper's *Recollections of Sixty Years in Canada* (1914), and Goldwin Smith's posthumous *Reminiscences* (1910), *Life and Opinions* (1913) and *Correspondence* (1913), all three edited by his literary executor, Arnold Haultain.

Other noteworthy books of this period are W. H. Atherton's *Montreal 1535–1914* (1914), John Ross Robertson's *Landmarks of Toronto* (1914), E. H. Oliver's *The Canadian North-West* (1914), and Doughty and McArthur's *Documents relating to the Constitutional History of Canada, 1791–1818* (1914); and in books of description and travel, A. P. Coleman's *The Canadian Rockies* (1911), Ernest Thompson Seton's *Arctic Prairies* (1911), Dr. Campbell's *Canadian Lake Region* (1910), and Charles Sheldon's *Wilderness of the Upper Yukon* (1911). Among a host of political and economic essays may be mentioned John S. Ewart's *The Kingdom Papers* (1914), Sir William Peterson's *Canadian Essays and Addresses* (1915), Sir George Foster's *Canadian Addresses* (1914), Sir Andrew Macphail's *Essays in Politics* (1910), Maj.-Gen. C. W. Robinson's *Canada and Canadian Defence* (1910), and Edward Porritt's *Revolt in Canada against the New Feudalism* (1911). In 1913 a new edition also appeared of Col. George T. Denison's *History of Cavalry*, written as early as 1876, and awarded in the following year the prize offered by the Tsar of Russia for the best essay on the subject.

In imaginative literature, the only books of verse that need be noted here are Bliss Carman's *Echoes from Vagabondia* (1912), William Wilfrid Campbell's *Sagas of Vaster Britain* (1914), William Henry Drummond's *Poetical Works* (1912), Marjorie Pickthall's *Drift of Pinions* (1913), Frederick George Scott's *Poems* (1912), and Arthur J. Stringer's *Open Water* (1914). In 1913 Dr. Campbell brought out his excellent anthology, the *Oxford Book of Canadian Verse*. In fiction, the most noteworthy names are those of Miss L. M. Montgomery, Charles G. D. Roberts, Norman Duncan, C. W. Gordon ("Ralph Connor"), Theodore Roberts, Alan Sullivan and Arthur Stringer.

With regard to the literature of the war, or of Canada's part in it, many volumes of personal experiences had already been published by 1921. A really notable book is *Winged Warfare* (1918) by Col. William A. Bishop, V.C. Others that may be named here are Col. George G. Naismith's *On the Fringe of the Great Fight* (1917), F. C. Curry's *From the St. Lawrence to the Yser* (1917), F. McKelvey Bell's *First Canadians in France* (1917), and *Captured* by Lieut. J. Harvey Douglas (1918). In 1917 appeared the first of six volumes of *Canada in the Great World War* (completed in 1921), an authoritative account of Canada's part in the conflict, by a number of competent writers. An official history of the war, from a Canadian viewpoint, under the title of *Canada in Flanders*, the first two volumes of which were prepared by Lord Beaverbrook and the third by Maj. Charles G. D. Roberts, appeared in 1916–8. Other war books of interest are Col. J. G. Adami's *Official War Story of the C.A.M.C.* (1910), Dr. Herbert A. Bruce's *Politics and the C.A.M.C.* (1910), J. F. B. Livesay's *Canada's Hundred Days* (1910), Hon. Henri S. Béland's *Three Years in a German Prison* (1919), Alan Sullivan's *Aviation in Canada* (1919), Capt. Harwood Steele's *Canadians in France* (1920), John W. Dafoe's *Over the Canadian Battlefields* (1910), and Sir Robert Borden's *The War and the Future* (1917). Through the foresight of Lord Beaverbrook and Dr. Doughty, Canada acquired an exceptionally complete collection of war records, paintings, and trophies.

Among the more significant of the post-war books are Sir Robert Falconer's *Idealism in National Character* (1920), J. L. Morison's *British Supremacy and Canadian Self-Government* (1919), Hon. W. L. Mackenzie King's *Industry and Humanity* (1918), R. M. MacIver's *Labour in the Changing World* (1919), W. C. Good's *Production and Taxation in Canada* (1919), A. H. Reginald Buller's *Essays on Wheat* (1919), Prof. Wrong's *The United States and Canada* (1921), W. G. Smith's *Study in Canadian Immigration* (1920), and two books discussing the relations between English-speaking and French-speaking Canada—O. W. H. Moore's *The Clash* (1918) and P. F. Morley's *Bridging the Chasm* (1919).

In history and biography there were such important works as J. S. McLennan's *Louisbourg* (1918), Chester Martin's *Lord Selkirk's Work in Canada* (1916), G. C. Davidson's *North West Company* (1919), William Smith's *History of the Post Office 1639–1870* (1920), W. R. Riddell's *Old Province Tales* (1920), Prof. Skelton's *The Canadian Dominion* (1919), Sir John Willison's *Reminiscences* (1919), W. T. Grenfell's *A Labrador Doctor* (1919), E. M. Saunder's *Life of Sir Charles Tupper* (1916), Skelton's *Sir Alexander Galt* (1920), and *Sir Wilfrid Laurier* (1921), Sir Joseph Pope's *Correspondence of Sir John MacDonald* (1921) and Walter Vaughan's *Sir William Van Horne* (1920). The Historical Section of the Canadian General Staff issued the first three volumes of an official *History of the Military and Naval Forces of Canada from 1763* (1920–21).

Of agencies which, each in its own way, were making in these later years for the development of intellectual life and scholar-

ship in Canada, none was more important than the Dominion Archives, the Royal Society of Canada, the Champlain Society, and two important Canadian periodicals, the *University Magazine* and the *Canadian Historical Review.* The Archives perform a triple service, in collecting and safeguarding the manuscript treasures of Canada, in affording facilities for research to students, and in publishing selected documents from its collections. The Champlain Society, with headquarters in Toronto, devotes itself to the publication of important works bearing upon Canadian history, and the reprinting of old works in the same field. J. B. Tyrell's editions of Hearne's *Journey* (1911) and David Thompson's *Journals* (1916), Dr. Doughty's edition of Knox's *Historical Journal* (1914-16), Grant and Bigger's edition of Lescarbot's *New France* (1911) and Col. Wood's *Select British Documents of the Canadian War of 1812* (1920), are admirable examples of Canadian scholarship. The establishment of the *University Magazine* under the control of three of the principal Canadian universities, and the transformation of the annual *Review of Historical Publications Relating to Canada* into a quarterly *Canadian Historical Review* widened the opportunities for the intellectual discussion of Canadian questions by Canadian writers in a Canadian periodical.

In imaginative literature during this later period, there are found several arresting books, such as Clive Phillipps-Wolley's *Songs from a Young Man's Land* (1917), John McCrae's *In Flanders Fields* (1918), Lloyd Roberts' *Poems* (1910), Norah Holland's *Spun Yarn and Spindrift* (1918), Marjorie Pickthall's *The Lamp of Poor Souls* (1916), Bliss Carman's *April Airs* (1916), Duncan Campbell Scott's *Lundy's Lane and Other Poems* (1916) and *Beauty of Life* (1921), Arthur S. Bourinot's *Poems* (1921), and Bernard F. Trotter's *Canadian Twilight* (1917). In fiction, the principal names were Sir Gilbert Parker, C. G. D. Roberts, Arthur Stringer, Theodore Roberts, W. A. Fraser, L. M. Montgomery, C. W. Gordon, Basil King and Norman Duncan. Among Canadian humorists Stephen Leacock (b. 1869 in England; on the staff of Upper Canada College, 1891-9; and later head of the department of political economy at McGill University) during 1911-21 had gradually established a widespread popularity, and his volumes of humorous essays and sketches gave him an international reputation as a writer, somewhat eclipsing his professional position as an economist. In this connexion also may be mentioned the *Goblin*, a really excellent comic monthly published by undergraduates of Toronto University. Two delightful books for children are Isabel Ecclestone MacKay's *The Shining Ship* (1918) and Cyrus MacMillan's *Canadian Wonder Tales* (1918). R. P. Baker has written a *History of English Canadian Literature to Confederation* (1920). (L. J. B.)

French-Canadian.—During 1910-21 there was a very natural desire among French-Canadian writers to do all that could be done toward keeping their compatriots true to type in race, religion, speech, thought, aspiration, letters and whatever else might encourage a distinctive form of life to persist unchanged by contact with the English-speaking world. Among the extreme Nationalists this unfortunately led to a self-conscious particularism, tending rather to weaken both ideas and expression by confining them within a narrow pale than to win an assured position in the intellectual world at large. The best written, however, of all the French-Canadian papers was *Le Devoir*, edited by Henri Bourassa, the Nationalist chief, who had kept it easily first in literary excellence, with the able assistance of Omer Héroux, Georges Pelletier, Ernest Bilodeau, Madame E. P. Benoît (" Monique "), and Madame H. St. Jacques (" Fadette "). Another Ultra, the Abbé Lionel Groulx, edited *L'Action Française*, a monthly numbering among its contributors that excellent stylist, Père Beaudé, whose *nom de plume* is Henri d'Arles. A wider outlook was taken by *Le Canada Français*, successor to *La Nouvelle-France*, once led by the scholarly pen of the Rev. Camille Roy. The widest and most diverse views were to be found in *La Revue Moderne*, edited by Madame Huguenin. *La Revue Trimestrielle* also took broad views, and had done good service to literature.

Three types of French-Canadian history were represented by (1) the *Histoire du Canada*, a big school-book written by the Christian Brothers from their own point of view, and without any reference to archives; (2) the five volumes of the *Cours d'Histoire*, ardently written by the Abbé Groulx in admirable French, and based on original sources, but carefully dividing the sheep of his own party from the goats of all others; and (3) the *Cours d'Histoire du Canada* by Thomas Chapais, whose scholarly taste, deep reverence for original research, and wide experience of public life preëminently fitted him for his distinguished rôle as professor of the Université Laval. Montreal was highly favoured in possessing that indefatigable archivist, E. Z. Massicotte. But Quebec was the headquarters of the new Provincial Archives, established in 1920 under the direction of Pierre Georges Roy, whose name had become famous for all that concerns the discovery, study, classification, and enlightened cataloguing of original documents, as well as for archival work at large.

Folklore was more and more studied by C. Marius Barbeau (Dominion Anthropologist), E. Z. Massicotte, C. Tremblay, Dr. Cloutier, Gustave Lanctôt, and others. The *Journal of American Folklore* devotes one number a year to the work of French-Canadians.

Pure literature made a very real advance in the decade. The great French-Canadian drama was still to seek; but in poetry Jean Nolin's *Les Cailloux* showed good achievement and still greater promise, while power was the predominant note of Charles Gill's *Le Cap Éternité.* Two women who emerged as poets had already done well and seemed likely to do better: Marie Le Franc's *Les Voix au Cœur et l'Âme* is both psychology and art; while Blanche Lamontagne's *Visions Gaspésiennes*, *Par Nos Champs et Nos Rives*, and *La Vieille Maison* showed a continual advance from merely tuneful and rather diffuse description to something like creation. Jules Fournier and Olivar Asselin, both most competent critics, had edited the *Anthologie des Poètes Canadiens* (1920). Fiction was well represented by Damase Potvin's *L'Appel de la Terre.* The late Louis Hémon, a Frenchman who lived and worked with the French-Canadian *habitants*, had, in his *Maria Chapdelaine* (1916), written a novel which was a true work of art and racy of the soil.

In other literature Laure Conan produced the best of introspective sketches in *L'Obscure Souffrance*, which is a kind of *journal imaginaire.* Her terse and finely chosen style greatly helped her penetrating vision to reach the very heart of her subject in everything she wrote, as, for instance, in her *Silhouettes Canadiennes.* Edouard Montpetit was both reminiscent and " previsionist " in his *Au Service de la Tradition Française.* And Adjutor Rivard, whose *Chez nos Gens* gives moving glimpses of *habitant* life, has placed all students of French under a deep debt of gratitude in his magnificent *Études sur les Parlers de France au Canada.* (W. Wo.)

CANALEJAS Y MÉNDEZ, JOSÉ (1854-1912), Spanish politician, was born in Ferrol July 31 1854. Coming of a middle-class family with university connexions, he graduated (1871) at the university of Madrid and took his doctor's degree (1872), becoming lecturer on Literature (1873). For a time he entered his father's engineering works as general secretary and studied railway problems, but continued his literary work, publishing a history of Latin literature in two volumes. He was early attracted to politics, sympathizing first with the Republican and then with the Liberal party. He was elected deputy for Soria in 1881 and his parliamentary ability asserted itself from the first. He became under-secretary for the prime minister's department under Posada Herrera in 1883, then Minister of Justice (1888) and of Finance (1804-5). He was president of the Chamber in the Moret administration, and became prime minister and chief of the Liberal party in 1910. It was while in office that he was murdered in Madrid Nov. 12 1912. Canalejas was a remarkably consistent statesman. He believed in the possibility of a monarchy open to a thoroughgoing democratic policy both in economic and in strictly civil and political matters. A sincere Catholic, he was nevertheless a strong anti-clerical, and a champion of

the rights of the State against the encroachments of the Church. By his death the Spanish Liberal party lost the only statesman capable of uniting it under one definite programme.

CANCER (*see* 5.175).—No striking change was witnessed in the years from 1910 to 1921 in the general attitude of medical men to the problem of cancer. Some new considerations have been submitted, however, and some new aspects of the subject disclosed. Industrial cancers occurring in tar workers and workers in paraffin shale have been the subject of observation by the Home Office in England, while the association between certain of the aniline products and malignant disease of the bladder has been pointed out in connexion with the health of German dye workers. Sir George Lenthal Cheatle has published, too, some observations on the manner of invasion of breast cancers which tend to show a passage up the milk ducts.

Generally speaking, the view is still held that while cancer tends to make its appearance on areas which have been subjected to irritation of one kind or another, there remains an unknown factor which determines its actual onset. Only a small percentage of cases which are subject to chronic irritation ever become malignant. This fact alone rules out the explanation of new growth in terms of local or even general irritation—a consideration which applies even to cancers in radiological practice.

In these circumstances a special interest attaches to the recent experiments initiated by Prof. Fibiger of Copenhagen. In 1913 this worker obtained for experimental purposes a number of rats. On examination he found that several of these had carcinomata of the stomach and further purchases from the same dealer produced more cancers. After most painstaking investigations Fibiger found that all these rats came from a certain sugar refinery which was infested with cockroaches. He obtained some of the cockroaches and had them examined. It was then found that they were carriers of an unknown nematode worm. This worm was consequently named *spiroptera neoplastica*. The female is 4 to 5 cm. long by about 0·2 mm. in diameter: the male less than half this size. The eggs are oval and clear and measure about 0·06 mm. and contain curled-up embryos. They can be seen in the body of the female or in the upper layers of the gastric epithelium, but occur only in that part of the stomach which is lined by squamous epithelium.

By feeding rats on the cockroaches or by giving them ova of the nematode to eat Fibiger was able to produce warty growths in their stomachs and occasionally cancers. He published a further paper in 1920 in which it was pointed out that the embryos of the worm having been hatched in the cockroach pass to the muscles of that insect and there encyst themselves. When the rat eats the cockroach the embryos are set free. Fibiger took rats and fed them on various forms of this worm and then examined 116 of them which had survived for periods of 30 to 298 days. The stomach of each was examined in serial section. None of the rats which died within 44 days of the eating of the worm showed any signs of cancer, but of 102 rats which survived from 44 days up to 298 days no fewer than 54 showed quite typical carcinoma of the squamous-cell type in the gastric col-de-sac. In the remaining 48 only benign proliferations and inflammations were found. These are almost invariably produced by the spiroptera.

Of the rats which died with gastric cancer in from one and a half to three months after injection of the infected material 20 had very small tumours, but 5 had multiple carcinomata; of 26 which lived for from three to ten months 18 had tumours of fairly large size and 8 had minute nodules while 15 had multiple cancers. Finally 8 rats which lived for prolonged periods had large tumours. The tumours, too, set up metastases which as a rule tended to be localized in the animals' lungs.

Cancer of the stomach had up till 1920 been produced in 89 rats. There had also been produced in some rats cancer of the tongue. In this latter case 217 rats were experimented on, care being taken to obtain mixed breeds. A relatively small number of rats developed inflammation of the tongue and a still smaller number got cancer. The inflammation began a few days after the injection of the spiroptera and in the great majority of cases was spontaneously cured in from two and a half to six months. It attacked all parts of the tongue; there was thickening of the epithelium of the organ. The cancer produced was found to be exactly similar to the cancer of the tongue found in human beings. The cancer persisted after the inflammation and all signs of the spiroptera had vanished.

The importance of this work lies in the fact that there would now appear to be a method of starting cancer *de novo* and so of studying it from its origin. Another parasite, cysticercus, has for many years been associated with the appearance of sarcomata in mice. Only one rat, of 2,500 examined at Copenhagen, was found to show a cysticercus sarcoma, and this curiously enough was one of Fibiger's animals. It was also infected with spiroptera and had, in addition to a sarcoma, a carcinoma of the stomach. Thus two different worms were able in the same animal to cause two different and well-recognized types of tumour. At least 90% of sarcomata in the liver of rats are said to contain cysticercus, and in these animals sarcomata far outnumber carcinomata. In mice, on the other hand, though the cysticercus is frequently found in the liver, sarcomata are never found. This fact must be emphasized as showing how dangerous conclusions on the subject may be. On the other hand there can be no doubt that Fibiger's experiments do throw a new light on a very baffling problem.

See *Comptes Rendus de la Société de Biologie*, vol. lxxxiii., no. 16; *British Medical Journal*, May 15 1920 and June 5 1920.

(R. M. Wi.)

CANEVA, CARLO (1845–), Italian general, was born at Tarcento (Friuli) in 1845. His birthplace being under Austrian rule until 1866, Caneva was educated at the Military Academy at Wiener Neustadt, but he entered the Italian army on May 1 1866. In 1892 he attained the rank of colonel on the general staff, and he was promoted to major-general two years later. He served in the African campaign of 1897, and in 1902 was promoted lieutenant-general. After commanding a division and an army corps, he became sub-chief of the general staff and in 1910 he was chosen to command an army in the event of war. The event came a year later, with the outbreak of war between Italy and Turkey; Caneva commanded one side in the much-discussed manœuvres of 1911, his opponent being Cadorna, and the former was declared victor, though military opinion was divided. In any event, it was probably owing to the result of the manœuvres that the selection to command the Tripoli Expeditionary Force fell upon Caneva rather than Cadorna. Caneva was given a thankless task. He was sent to occupy the coast towns, in the belief that the Arabs and Berbers would welcome the Italian occupation, and that the Turkish garrison unsupported by the tribesmen could be brought to surrender with little or no difficulty. He was speedily undeceived, and the initial over-confidence was succeeded by a period of excessive caution. For a time Caneva could do nothing, as he had no transport, and later on he was hampered by orders from home which forbade risks or heavy casualty lists. But even allowing for his handicaps Caneva was generally considered to have carried the waiting policy too far and clung to it too long. Although the late spring and summer of 1912 saw a change, and several important successes were gained, Caneva was recalled to Italy on Sept. 2, and shortly afterwards retired. He presided over the commission of inquiry into the Caporetto disaster in 1917. (W. K. McC.)

CANTEEN, a generic term for the building and organization which provides for the soldier's recreation and extra-regulation comforts. The use of this term has naturally been extended to cover similar buildings and organizations which provide the same services for factory workers and others who live and work together in considerable numbers; but here it is sufficient to deal with canteen organization and its results in the British and American armies during the World War.

The effort which was made in most of the armies in the field to mitigate campaign hardships by canteen organization reached its highest point in the American and the British armies. The American organization was chiefly in the hands of the American Y.M.C.A. (which was also entrusted with the educational work in the American army). The British organization was, as regards the home camps, chiefly in the hands of the army and navy canteens, the Y.M.C.A., the Church Army and the Salvation Army; as regards the armies abroad in the hands of the Expeditionary Force canteens and the private agencies mentioned, whose personnel in the field were given the right to wear uniform and to use military transport and billets.

As regards the British army, the Expeditionary Force canteen in 1918 was a vast organization operating in every theatre of war. It provided for officers and men cheap shops, good rest and recreation centres, and for officers excellent hotels. From the Expeditionary Force canteens the soldier could buy cigars, cigarettes, chocolate, sweets and all kinds of canned goods, duty free, and at prices far lower than those of the London shops. Whisky, wine and beer could be bought duty free, under some restrictions.

The Expeditionary Force canteens organization was formed first in 1915. Its operations commenced in France, but were subsequently extended to all theatres of war. The undertaking was from its commencement conducted by Sir Alexander W. Prince and Colonel F. Benson. In due course the organization took on various other

functions, but its canteen business alone made it by far the biggest shopping concern in the world. The "supplies and shipping" department of the Expeditionary Force canteens had for canteens alone an average annual turnover of approximately £20,000,000. From three to four thousand different articles appeared on the stock sheets. The tonnage handled was enormous, and during the month of Nov. 1918 it reached nearly 12,000 tons, representing 320,000 cases, in France alone. The record week was that ending March 16 1918, just prior to the great German offensive, when 3,643 tons of canteen supplies were landed, and a turnover amounting to £400,000 was reached. The tonnage off-loaded for the year 1918 was 121,000 tons, and comprised over three million packages. The growth of the total sales at canteens and depôts in France is shown by the following figures (by half-years ending at the dates mentioned):—

June 1915 . . .	£ 120,000	June 1917 . .	£6,000,000
Dec. 1915 . . .	700,000	Dec. 1917 . .	8,000,000
June 1916 . . .	2,000,000	June 1918 . .	9,500,000
Dec. 1916 . . .	4,000,000	Dec. 1918 . .	9,500,000

Profits were kept to a strict minimum, and by a happy decision prices for the same goods were the same on every front.

Another feature of the Expeditionary Force canteen work was that it served the man in the fighting line first and the man in the rear zone second. When in 1917-8, owing to the shipping position, Expeditionary Force canteen supplies had to be restricted, and the complaint came that what supplies did come over were largely absorbed at base and on lines of communication, and the men in the front line got very little, the quartermaster-general ordered that (1) certain luxuries which were in very short supply should go only to the front area canteens and not at all to the base; (2) other goods should go in the proportion of four to front areas and one to the base. Beer was a special problem, as its bulk made demands on tonnage which could no longer be admitted. G.H.Q. did not like the prospect of stopping the soldiers' beer, and accordingly the Q.M.G.'s department took over, in part or in whole, breweries in the army areas and arranged to brew beer locally, importing only the malt and the hops from England. American canteens were, of course, "dry."

The work of the British Expeditionary Force canteens in France was the most important as regards figures, but probably on the remote fronts it was of greater value in showing the troops that they were still in touch with home. In Egypt and Palestine the organization pushed forward its comforts far into the desert on camel-back, and on these fronts about £5,000,000 a year passed over its counters. On the Mesopotamia front there were 37 canteens, the most remote being at Khaniqin (in Persia); and one flourishing branch was at Qurna, the legendary site of the Garden of Eden, where soldiers could buy most of the fruits of the earth in canned form. A canteen boat was kept plying on the Tigris. The Salonika front and the British front in Italy were also well supplied with canteens.

The work of the British Expeditionary Force canteens was sometimes carried on under conditions of some danger, as forward canteens were never withdrawn on account of hostile shell-fire unless it became very intense. During the German advance in the spring of 1918 the Expeditionary Force canteens lost very heavily in goods. As the enemy came forward and the canteens had to be evacuated the stocks of spirits were destroyed, other goods given away to the troops as they passed, and the residue destroyed by fire.

The British Y.M.C.A. during the war spent a gross of £21,900,000 on canteen work for British troops and war workers. Of this sum £17,300,000 represented refreshments sold. The Y.M.C.A. provided "dry" canteens, amusements and stationery, and in rear areas was in charge of lecture and other educational work. Its free gifts to the troops were valued at nearly £1,000,000, and all profits made at canteens were put back into war work. After the Armistice, when public subscriptions to the Y.M.C.A. fell off, the British War Office, recognizing the importance of its work, advanced to it £700,000 to enable it to continue operations during the period of demobilization. Subsequently £590,000 of this was made a free gift. Y.M.C.A. work was carried on in every theatre of war.

The Church Army provided nearly 2,000 canteen centres for the British army, of which about one-half were in France and others in Mesopotamia, Egypt, Malta, Salonika, Gallipoli, India and at naval bases. (F. F.)

When the American army arrived in France, the U.S. Red Cross had already established and was operating a canteen system for the French army. This system was extended, the existing organization naturally forming a base, since the American Expeditionary Force was superposed on the forces already in the French zone, and at first used the same lines of communication. Military canteens were also established by the troops themselves. But by far the greater part of the canteen work in touch with troops was carried out by the American Y.M.C.A., which, by an army order of Sept. 6 1917, took over responsibility for canteen work generally. The order forbade the establishment of a military canteen where a "Y" was available, and finally over 1,200 canteens or recreation halls were in operation. Affiliated to the Y.M.C.A. and working in connexion with its canteen system were library, educational, athletic and entertainment organizations in profusion. The Y.M.C.A. also coöperated in the work of the French "*Foyer du Soldat*." On a smaller scale, similar work was done by the "Knights of Columbus."

CAPELLO, LUIGI (1859–), Italian general, was born April 14 1859. He entered the infantry, and his career till he became a general officer was passed in this branch of the service. During the Italo-Turkish War he served in Cyrenaica, and as a major-general he took part in the operations round Derna, commanding a column in the final action of the war in Oct. 1912. In 1913 he was promoted to lieutenant-general. He commanded the 25th Sardinian Div. during the early attacks upon the Carso in the summer of 1915, and the VI. Corps opposite the southern part of the Sabotino-Podgora bridgehead in Sept. 1915. In Aug. 1916, Capello, whose command had been increased to the strength of six divisions, conducted the attack which stormed the bridgehead and led to the capture of Gorizia. A difference of opinion between Cadorna and Capello led to the latter's transference to the Trentino front, where he commanded successively the XXII. and V. Corps in the Asiago uplands. In March 1917 he returned to the Julian front as commander of the "Gorizia Zone" (VIII., VI. and II. Corps), in which capacity he conducted the first phase of the Italian offensive in the following May. In June Capello was given command of the II. Army, which extended from the Plezzo valley to the Vippacco, and in Aug. he directed the attack on the Bainsizza plateau. There was a difference of opinion between Cadorna and Capello regarding the development of the action after the initial success, and this difference became more serious when Cadorna decided to stand on the defensive in view of the forthcoming enemy attack. Capello wished to go on attacking, and it is difficult to avoid the conviction that his belief in his own method of meeting the coming threat prevented him from coöperating whole-heartedly in the plan of his chief. Capello fell ill shortly before the enemy attack was launched and only returned to his post on the very eve of the battle. He was quite unfit for the strain of command, and had to resign after two days. When sufficiently recovered in health he was given the task of creating the new V. Army out of units broken and disbanded by the retreat. To this task he gave all his energy, and in it he achieved remarkable results, but in the spring of 1918, on the constitution of the Caporetto Inquiry Commission, he was put on half-pay, and in July he was retired. After his retirement Capello wrote two books, a reply to the criticisms of the Inquiry Commission, entitled *Per la Verità*, and *Note di Guerra*, a work which deals with the Italian campaign as a whole but especially with those operations in which he played an active part. He also took some part in politics, presiding at various important Nationalist and *Fascisti* meetings.

CAPE PROVINCE (*see* under CAPE COLONY, 5.225), the largest of the provinces of the Union of South Africa. At the 1911 census the inhabitants numbered 2,564,965, of whom 582,377 were whites and 1,982,588 coloured, an increase since 1904 of 8·33% in the coloured pop. but of only 0·45% in the white.

Among whites, females exceeded males by 43,623; among the coloured people by 63,782. In 1918 a census of whites only was taken. They then numbered 618,825, an increase of 6·41% over 1911, affording an example of the abnormal fluctuation to which the white pop. of S. Africa is subject. Of the 1911 pop. 96·47% of the white and 44·20% of the coloured inhabitants returned themselves as Christians. The coloured inhabitants were divided into Bantu 1,519,939, Asiatic 7,690, and "mixed" and other coloured 454,959. This last category included a few thousand Hottentots and Bushmen, but the majority were the mixed white and black "Cape Boy" class commonly called "coloured" in distinction from "natives." In 1911 of the whole coloured pop. 24,000 were engaged in professions or commerce and 93,000 in industries. Many districts of the province are arid or semi-arid, and over most of its area there are not more than seven persons per sq. mile. The pop. is mainly found in the fertile S. and S.E. coast regions, and of the Bantu in 1911 no fewer than 871,062 lived in the Transkeian territories, where there were 54 persons to the sq. mile. These Bantu are still heathen and nearly all are agriculturists. There were in 1911 only five towns with over 12,000 inhabitants, namely Cape Town (161,759), Kimberley (44,433), Port Elizabeth (37,063), East London (24,606) and Grahamstown (13,830).

Administration.—The affairs of the province are in the hands of a provincial council, elected for three years and not subject to dissolution save by effluxion of time. The qualifications for electors and members of the council are the same as for the members elected by the province to the House of Assembly

(save that a provincial councillor must live in the province in which his constituency is situated). Under this provision in the Cape province natives and other non-white races possess the provincial franchise. At the 1917 registration there were 150,000 white and 30,000 coloured electors. The number of constituencies are also the same as for Parliament.[1] The provincial council has powers of legislation on subjects specifically assigned to it by the Act of Union and on subjects delegated to it by the Union Parliament. These powers include direct taxation within the province in order to raise revenue for provincial purposes and the control of municipalities and other local bodies, and of "elementary education"—which embraces all education other than university. Its enactments are called ordinances, and no ordinance is valid so far as it may be repugnant to an act of the Union Parliament. In short, though a legislative body, the provincial council exercises no authority which Parliament cannot revoke. There is no separate judiciary, or police force, or civil service, nor any separate departments of general government. Moreover, harbours and railways are under the control of the Union Parliament.

The provincial council is presided over by a chairman, elected from its members; and the council also chooses an executive committee of four, who need not be members of the council. The chief executive officer is styled administrator and is chosen by the Union ministry; the administrator is appointed for five years and is irremovable. A provincial auditor is also appointed by the Union ministry and is removable only for reasons which must be submitted to the Union Parliament. The Union ministry likewise appoints an attorney-general as legal adviser.

Revenue.—Under provisions of the Financial Relations Acts of 1913 and 1917 the Union Government pays to the provinces an annual subsidy amounting to one-half of the estimated normal provincial expenditure for the year. This financial dependence of the provinces on the Union Government emphasizes their subordinate position and is a guarantee against any tendency in the provinces to go beyond the scope of local affairs.

The subsidies paid to the Cape provincial council varied from £862,000 in 1913–4 to £909,000 in 1917–8; the revenue raised by the province was £405,000 and £426,000 respectively in the years named, but had been as low as £316,000 in 1914–5. Transfer duties and licences (trade, liquor, motor, etc.) were the chief sources of revenue. The chief item of expenditure is on education; thus in 1913–4, out of a total expenditure by the provincial council of £1,142,000, the sum of £853,000 was spent on education. In 1917–8 the figures were:—total expenditure £1,477,000; on education £1,150,000. In 1920–1 the cost of education had risen to £2,163,000, the number of children on the school rolls being 284,000, an increase of about 50,000 since 1913. In primary schools education is free.

History.—Politically the Cape province has had no separate history since the establishment of the Union in 1910. Parties in South Africa are not divided on provincial lines; it may, however, be recorded that the majority of the Cape members of Parliament have favoured the maintenance of the British connexion and the fusion of Dutch and British interests. In the rebellion of 1914 De Wet in his effort to reach German S.W. Africa entered the province and was captured at a place 110 m. W. of Mafeking. In domestic concerns the province showed a progressive attitude, notably in its care for education. Bilingual requirements gave rise to no great difficulty, the provincial council having passed an ordinance in 1921 providing that the medium of instruction up to standard IV. should be the "home language" of the child. Provincial spirit remained keen, but the white inhabitants of the eastern district, who are largely (if not mainly) of British descent, look to the Transvaal and Free State for trade, while with the people of the western part of the province (who, Cape Town apart, are predominantly of Dutch origin) they have practically no commercial intercourse.

Sir N. F. de Waal, who had been colonial secretary in the last ministry of Cape Colony, was the first administrator, and he guided the province through the period of change caused by the establishment of the Union. He served for two successive periods and was reappointed for a third time in 1920. There was no introduction of party politics in the provincial council (as happened in the Transvaal province).

The period 1910–20 witnessed considerable industrial and agricultural development and a significant growth of Ethiopianism and trade unionism among the native and coloured people. These were not features peculiar to the Cape province, though, as the Cape contained a larger proportion of educated natives and there was no colour bar to the exercise of the franchise, the province was the chief centre of native agitation for social and industrial rights. An indication of the activity of the Anglican Church was the creation of two new dioceses, George (1911), and Kimberley and Kuruman (1912).

An event which caused a deep impression on the public mind was the epidemic of influenza in the autumn of 1918. It was estimated that a quarter of the inhabitants suffered and for three or four weeks business in the cities was dislocated, so numerous were the victims. (F. R. C.)

[1] The particulars here given of provincial administration are the same in all four provinces (the Cape, Natal, Orange Free State and Transvaal) save that the minimum number of members of a provincial council is 25, whereas Natal and the Free State return fewer members to Parliament.

CAPES, BERNARD EDWARD JOSEPH (1854–1918), British novelist, was born in London Aug. 30 1854 and educated at Beaumont College. He was a nephew of John Moore Capes, a prominent figure in the Oxford Movement, and was brought up a Roman Catholic. Originally intended for the army, he was prevented from taking a commission by a mistake as to the age at which he should have presented himself for examination. He was then put into a tea-broker's office and for some years struggled with uncongenial work, finally abandoning it to study art at the Slade School, London. In 1888 he joined the publishing firm of Eglington & Co. and succeeded Clement Scott as editor of *The Theatre*. In 1892 the firm came to an end, and he made an unsuccessful experiment in rabbit farming. But in 1896 he won a prize offered by the *Chicago Record* for a novel of mystery and henceforth devoted his energies to fiction. His novels, 36 in number, were mostly tales of adventure, some of them historical. They include *The Lake of Wine* (1898); *From Door to Door* (1900); *A Jay of Italy* (1905); *A Rogue's Tragedy* (1906); *The Story of Fifine* (1914) and *Moll Davis* (1916). He published also a volume of verse. He died at Winchester Nov. 2 1918.

CAPE TOWN (*see* 5.252), capital of the Cape province, and seat of the legislature of the Union of South Africa. In 1913 Cape Town municipality was greatly enlarged by the absorption of the suburban municipalities of Green Point and Sea Point, Woodstock, Maitland, Mowbray, Rondebosch, Claremont, Kalk Bay and Muizenberg, with Camps Bay and other adjacent areas. Cape Town thus extends across the Cape Peninsula from Table Bay to False Bay—a distance of 17 m.—and covers an area of over 50 sq. miles. Wynberg (between Rondebosch and Muizenberg), though retaining a separate municipality, is a suburb of Cape Town. The pop., including suburbs, 170,083 in 1904 (44,203 whites), was 161,579 in 1911 (85,442 whites and 76,137 coloured). In 1918 the white pop. was 99,603; the coloured (estimate) 82,000.

Business, professional and official life is concentrated in Cape Town and at the docks. The chief feature of the decade 1910–20 was, however, the development of the suburbs, an enterprise in which the municipality took the lead. Cape Town in the season (Oct.–March) is the principal pleasure resort of South Africa.

On the sea front at Table Bay a promenade pier (1,500 ft. long) and esplanade (1,000 yd.) were completed in 1914. The pier replaces the old central jetty and is in a line with Adderley Street and Government Avenue, the principal thoroughfares. To the Houses of Parliament, in Government Avenue, a new wing was added (1910). At the foot of the Avenue is the site of the National Art Gallery. The Max Michaelis collection of Flemish and Dutch masters—including examples of Rembrandt, Frans Hals, Jan Steen and Vandyck—presented to the Union Government in 1912, is in "the Old Town House," in Greenmarket Square. The building, a fine example of colonial Dutch 18th-century architecture, was transferred to the Government in 1916.

Rondebosch, 5 m. from the centre of the city, is the chief residential suburb. It contains Groote Schuur, formerly the property of Cecil Rhodes; since 1910 the official residence of the Prime Minister of the Union. In 1918 on the incorporation of the South African College (founded at Cape Town 1829) as the university of Cape Town, a site for new buildings—to replace those in the centre of the

city—was granted in the grounds of Groote Schuur; £500,000 towards buildings and endowment being provided mainly from bequests by Sir Julius Wernher and Mr. Alfred Beit. In 1912 a Rhodes memorial was unveiled at Groote Schuur by Earl Grey (a former director of the Chartered Company). In front of the memorial, a granite temple in the Doric style approached by a flight of steps, is the equestrian statue of "Physical Energy" by G. F. Watts. In the temple is a bust of Rhodes. Not far from Rondebosch, at Kirstenbosch, are the National Botanical Gardens, established 1913. In Oct. 1918 Cape Town suffered from a great epidemic of influenza, 7,000 deaths occurring in three weeks. In the autumn of 1919 influenza, but in a milder form, again ravaged the city.

Cape Town has since 1913 ranked second in importance to Durban among South African seaports, but it is first for passenger traffic. The shortage of shipping did not greatly affect Cape Town until 1918. In that year the total tonnage of cargo landed, shipped and transhipped at Table Bay was 1,070,000, the average for the three previous years being over 1,440,000 tons. In 1918 the net tonnage of shipping entering Cape Town was 2,347,000—British, 1,662,224; foreign, 684,776. In 1919 British shipping had increased to 2,253,000 net tons, while foreign shipping fell to 424,000 net tons. In 1918 the ratable valuation of Cape Town was £21,258,000, municipal revenue £778,000 and indebtedness £4,893,000. In 1919 the ratable valuation was £23,343,000.

Direct communication with the railways of the S.W. Protectorate (ex-German S.W. Africa) was opened in 1915 and in 1918 the railway going north had reached Lualaba (Upper Congo) at Bukama, a distance of 2,598 m. from Cape Town without break of gauge. An aerodrome on the trans-Africa air route was laid out at Young Field, Wynberg, in 1919, and the first airmen to cross the length of Africa, Lieut.-Col. Sir H. A. Van Ryneveld and Flight-Lieut. Sir C. J. Q. Brand, arrived at Wynberg on March 20 1920. A wireless station at Slang Kop, 18 m. S. of Table Bay, was opened in 1911. It has a normal range of 450 m. by day and 1,500 by night.

CAPITALISM.—The meaning of "capital," in economics, is analyzed in the earlier article under that heading (5.278). But the working of "capitalism" or the "capitalistic system," as such, had by 1921 become so highly controversial a question as to require here more detailed examination.

The term "capitalism" is generally applied to the system under which the instruments of production are the property of private owners, who usually employ managers and manual workers to carry out production by their means. By production we must include, if this definition is to be correct, the whole of the process by which raw materials are brought to the place of manufacture and worked up into manufactured goods, and the manufactured goods are then distributed to the places where they are wanted and sold to the final consumer through the hands of retailers. The instruments of production thus include not only the land, factories, tools and machinery, and other equipment used in actual manufacture, but the railways, ships and other means of transport, and the warehouses and shops through which the goods finally pass to the consumer.

Private Ownership.—Private ownership of the instruments of production has not been universal in man's economic history, but it has been generally adopted by progressive communities. When "Adam delved and Eve span," they were "capitalists" in the sense of owning a spade and spinning-wheel and using them for purposes of production; but they used these tools themselves and for the purposes of supplying their own needs. And at a very primitive stage of society, this simply individualistic system by which the capitalist used his own tools and worked for his own needs may be presumed to have been common. When, however, by the development of a wider society the division of labour and the exchange of goods between one member and another of the community began to be practised, the new feature arose by which the producer made and grew goods not only for his own use, but to be exchanged for goods grown or produced by others; and consequently he had to produce something which somebody else wanted if he wished to provide for his own needs to his own satisfaction. Thus we find in the Middle Ages artificers and craftsmen owning their own tools, that is to say, their own capital equipment, and working to produce articles such as armour, farming implements and clothes which they exchanged in return for the food produced by the farmers who would only take the goods produced by the artificers if they were of a kind which pleased their fancy. It is important to note at the outset that the capitalist, whether he works with his capital or sets others to work with it, must invariably direct the work done so as to suit the wishes of a buyer which may or may not be expressed before the making of the article is begun. Capitalism, in the sense of a private ownership of tools and equipment, thus dates from the earliest organization of human economic activity. As soon as a savage had given time and labour to fashioning a weapon with which he could more easily kill or catch animals that he hunted for food or clothing, he had become a capitalist; he had made something which would help him to provide for his own needs and those of his dependents more easily, or by which he could more easily acquire commodities which he could exchange against those owned by other members of his tribe. But capitalism in the modern sense, and as defined above, is usually said to date from the last quarter of the 18th century, when what is called the "Industrial Revolution" began, and by the inventions of machinery and the use of steam industry was reorganized on a new basis.

Capitalist and Worker.—Owing to these developments it was no longer possible for the workman using his own tools and working in his own home to compete with workmen who were assembled in a great factory and worked with machinery which it would not have been possible for their collective resources to buy. Thus arose the distinction between the worker and the capitalist, which had in effect already made considerable progress before the introduction of machinery, but was so rapidly developed after it that modern capitalism is usually so dated. By this system the worker, by which is generally meant the manual worker, is said to have been divorced from the ownership of his tools. The scale of industrial organization became so great that it was only possible for men of great means, or for a collection of people of considerable means, to provide the necessary land, factories and equipment for its working, and also to buy the large quantities of raw material required, to pay the wages of the multitude of workers and managers, and to finance the other expenses during the process of production and up till the time of payment by the final purchaser.

Originally it was usual for the owners of these factories, whether individuals or small bodies working in partnership, to act as managers of the whole concern. The capitalist was at once owner of the factory and machinery, provided the money needed for the financing of the industrial process, and managed and organized the whole enterprise. He was responsible for buying raw materials, paying wages and selling the product to the greatest possible advantage to the other capitalists, merchants and middlemen, who passed it on until it reached the final consumer; he, singly or in partnership, took all the risk of loss involved if the product failed to suit the caprices of the buying public, and took all the profit, if any, that was earned from the enterprise. This profit thus included interest on his money invested, the payment of his salary as organizer and manager, and any extra bonus which his skill might enable him to earn as compensation for the risks run.

Joint Stock System.—As industry developed on a still greater scale it was not possible for this comparatively simple organization to be maintained. When it became a question of building railways, requiring hundreds of millions to finance them, no individual or partnership could supply the necessary funds, and so the joint stock system, which had already been developed on a small scale in mediaeval times, was extended so successfully to industry that the greater part of our industrial activity is now carried on by means of joint stock companies, the extension of which was enormously facilitated by the introduction of the principle of limited liability. Thus the position of the capitalist has become still further defined and differentiated. It is certainly probable that the managers of most of our great industrial concerns hold a certain number of shares in the business which they conduct, and to that extent may be described as capitalists, but the two functions are now quite distinct. The capitalist pure and simple lends money to industry or invests it in industry, using industry in the widest sense of the word to include transport and commerce. The actual management is carried on by officials appointed specially for this purpose under the supervision

of a committee of the shareholders who are called directors, who are paid comparatively small fees for the usually rather nominal supervision which they exercise over the more highly paid work of the managers and staff, and for guiding the financial policy of the company with regard to dividend distributions and so on. The capitalist is either a creditor or a shareholder in the company which is formed by public subscription to carry on the industry in question; all that he does is to lend to industry the money which is essential in order that the industry may acquire all the tools, machinery, buildings, raw materials and other equipment necessary for carrying on the work, and to pay the wages of the wage-earners and managers during the initial period before the company's operations have produced something that can be sold to supply money for wages, the purchase of further raw materials, and the upkeep of the plant. The business of management is carried on by highly paid experts, and the capitalist's sole claim to a share in the earnings of the company is based on the fact that he has provided the money which was essential for its beginning and for its further growth. He earns his reward first by placing this money at the disposal of industry instead of spending it on his own immediate enjoyment; and secondly by risking the loss of part or the whole of his money if the industry should fail.

Capital Financing.—A highly ingenious machinery has been developed for the provision of money for industry and commerce by the process of investment in the securities of public companies, and for the turning of these securities back into money by their sale in markets known as stock exchanges. Joint stock companies are formed either to carry out some new enterprise, or work some new process, or to take over an existing business which has hitherto been carried on by private partners. An appeal is therefore made to the public to subscribe to the securities into which what is called the company's capital is divided. As so often happens in these matters of business, great confusion arises owing to the use of the same word in different senses: the capital of industry has hitherto been referred to in the course of this article as the tools, buildings, and other equipment by which industry works; but the capital of a company generally means the money that it receives from those who subscribe to the securities that it offers. If we take the case of a company formed to work a coal mine, and suppose that the original promoters consider that £2,000,000 will be necessary for them to make a proper start on the enterprise, then these two millions will be the original capital of the company, subscribed to it by investors who receive, in return for their money, securities which give them claims upon it for interest, dividends and repayment either at a fixed date or in the event of the company's liquidation. These claims take the form of securities issued by the company. They would probably be divided into several categories; there will be a debenture stock, perhaps carrying mortgage rights and entitling the holders to a fixed rate of interest, and most probably to repayment in full or at a premium at some future date. In case of default in payment of their interest or repayment of the sums promised at the due date, the debenture-holders would be entitled to take over the property and put it in the hands of a receiver. They are thus not shareholders in the company but its creditors, and, strictly, securities issued in this form of a mortgage or debenture are not part of a company's capital but its debt. Ordinary business parlance, however, usually includes mortgages and debentures as part of capital. The share capital is usually divided into preference and ordinary, the preference shareholder being entitled to a fixed rate of interest which has to be paid to him before the ordinary shareholders receive anything. This preference right among English companies is usually what is called cumulative, that is to say, if the preference dividend is not paid in any year all arrears have to be paid before the ordinary shareholders receive any return on their investment. In America, however, where the term "preferred" rather than "preference" is more usual, this cumulative right is not so common as it is in England; in some cases also preference shareholders are entitled to a further participation in profits after a certain rate of dividend has been paid to the ordinary shareholders. The ordinary shareholders as a rule take what is left of the profits after the claims of debenture-holders and preference shareholders have been satisfied. If the company is successful they thus earn higher rates on their investments than go to the holders of other forms of securities. If the company fails they receive little or no profit, and the claims of the mortgage and preference shareholders have to be satisfied in full before the ordinary shareholders get any of their capital back in case of liquidation. Almost infinite variations, however, are performed on the theme of capital arrangements, with income debentures, cumulative ordinary shares with a fixed rate of dividend, deferred shares, founders' shares and so on. And some companies issue no securities except ordinary shares or stock.

By this ingenious system the amount of risk involved by industrial investments can be varied to suit the taste of the individual investor, but generally with the result that the less risk he takes the less return he is entitled to on his investment. The holder of a debt which is a first charge on a long-standing and well-managed industrial or transport concern comes as near as he can to eliminating risk altogether from an industrial investment. It consequently follows that this kind of security is originally issued and is dealt in on the markets of the world on terms which give their subscribers or purchasers a comparatively low rate of interest. The preference shareholder, who is not as well secured as the debenture-holder, but ranks before the ordinary holder, also stands midway between them in the matter of risk and the matter of return. Before the World War, for example, if a well-known English brewery company were appealing to the public for subscriptions it would probably have been able to issue its debenture stock in return for a promise of 4% to 4½%, its preference shares on the basis of 5% to 6%, while its ordinary shares, if they were to expect a ready response from the public, would have had to show a probable return of 7% or 8%.

When the prospectus has been issued and the public subscription has been carried out, the securities offered are then quoted on the Stock Exchange at prices which will vary with the opinion held concerning the present and prospective prosperity of the company, and also in accordance with the general rate ruling for the use of money, which varies like the price of everything else in accordance with supply and demand. At a time when there is a great demand for capital for the development of new and old enterprises all over the world the rates that have to be offered in order to tempt subscribers will be forced up by competition, and consequently the price of existing securities will tend to fall owing to sales by their holders, who are tempted by the more alluring rates offered by new ventures. If, on the other hand, enterprise is slack and new creations of capital are comparatively rare, then the pressure of accumulating savings for investment in existing securities will force their prices up and so lower the rate of return which an investor may expect.

By this means capitalism has devised a highly efficient machinery through the mechanism of the Stock Exchange by which anyone who has lent money to industry, as conducted by an ordinary joint stock company, is able in normal times to realize his holdings and turn them into cash by sale on the stock markets. If the company in which he has invested has been successful and is fulfilling, or more than fulfilling, the anticipations held out in its prospectus, he will be able to sell his holdings at a comfortable profit, especially if he is an ordinary shareholder. The prices of securities with a fixed rate of interest or dividend naturally fluctuate less than those of the ordinary shares, but even in their case the success or failure of the company has a very considerable influence upon the price for which they would be sold. Many popular securities have a world-wide market and can be dealt in in all the financially civilized countries; and this development of securities readily marketable at publicly quoted prices has been a great assistance to the growth of international banking.

Freedom of Enterprise.—By the development of this machinery it is possible for the association of small contributions by a large number of people with comparatively small means to carry out enterprises on a colossal scale, and to pour the stream of investment into all the countries of the earth, fertilizing its backward

places and bringing forth a vigorous crop of goods and services and making the world into one great market united by the bonds of industry and finance. In many large industrial companies nowadays, shares of £1 each or less are now issued, and in this way capitalism has been democratized to an extent which a hundred years ago would have been thought quite incredible. Enormous enterprises, the most obvious example of which are the Egyptian pyramids, have been carried out in the past by means of slave labour employed by tyrants; and the Roman roads and aqueducts are another example of what could be done by the application of state management to a highly disciplined people. But the most notable achievement of modern capitalism is that it has vastly increased the productive power of mankind by making use of the resources of thousands of individuals voluntarily subscribing their money in the hope of profit which can only be earned if the consuming public will voluntarily buy the goods and services produced. Thus capitalism is essentially based on freedom—the freedom of the subscriber in risking his money, and the freedom of the consumer in giving or withholding his custom and the profit that it makes possible. It opens its pocket freely—sometimes too freely—to anyone who can persuade it that an enterprise is likely to be profitable. Under it the way is open from the bottom of the ladder to the top for those who have the diligence, determination, capacity, and luck to climb; and they can climb only by producing something that will fetch a good price in the market of their fellow-creatures' needs and desires. The freedom of capitalism is thus limited by the consumers' veto. It can only succeed by pleasing the ultimate buyer and coöperating with the consumer by satisfying his needs.

Prejudice against Capitalism.—Nevertheless, capitalism is perhaps now more virulently criticized than any other human institution, largely owing to the belief that it involves robbery of the wage-earning classes by those who place the means of production at their disposal and pay them wages for working upon them. The prejudice against capitalism could not be as wide as it is unless there were some foundation for it; and in the first half century in which modern capitalism was active the exploitation of the wage-earners through low wages, long hours, disgraceful working conditions and ruthless dismissal at any time when it seemed more profitable to the employers to reduce output, was carried on to an extent which is now seen to have been criminal. This seems to be the reason for the astonishing hold which the works of Karl Marx have exercised upon those of the wage-earners who are attracted by his revolutionary doctrines. It is admitted by Marx's most fervent admirers that most of his theories were wrong, that many of his assertions were incorrect, and that most of his forecasts have been proved to be baseless. But the fact remains that he was able to describe a state of things in English industry on the authority of official documents which was entirely disgraceful; and the wage-earners, who probably seldom study his works but usually rely upon a summary of their contents, find that with regard to the exploitation of the worker he has a solid basis of facts which are known to them by the tradition they have received from their forbears who worked under the miserable conditions that he describes.

It need not be said that since the middle of the 19th century there has been a very great change in this respect, thanks to Factory Acts, the growing strength of the trade unions and a more humane and sensible spirit among the employers; and it is interesting to consider why it should be that the employers of the first half of the 19th century, most of whom were probably quite human and kindly people who thought that they were doing their best according to their lights, should have treated those who worked for them in a manner which now seems to us so inhuman. In the first place, we must remember that a very large number of them in those days were men who had risen from the ranks and had themselves had to suffer the hardships which they imposed on others, and, since they had come through them successfully, did not see any reason why anything better should be done for those who worked under them. But a further excuse has to be found for the men of noble lineage and high intellectual attainment, who also suffered barbarities to be perpetrated in the mines and factories which they owned; and this excuse is provided by the pessimistic utterances of economists such as Adam Smith, Malthus and Ricardo, who stated or implied that the pay of the wage-earners could not rise above the level required to maintain them as efficient workers; and that any attempt to improve their condition would simply lead to an increase in their number by procreation which would inevitably defeat the efforts of those who tried to improve their lot. With doctrines such as this in the air, and expounded by high authority, there is some reason to excuse wickedness or mistakes which have cost the industrial world dear by the legacy of bitterness and suspicion which they have left behind.

Capitalism and Wages.—It is also true that too many modern capitalists are still apt to resent any attempt on the part of the wage-earners to improve their lot by demanding better wages and shorter hours of work, and do not seem able to perceive how entirely short-sighted such resentment is. When the wage-earners are confronted, every time they ask for an improvement, by demonstrations on the part of capitalists that its granting would immediately ruin the industry in which they are concerned, and when nevertheless they insist upon the improvement and then find that the industry is by no means ruined but goes ahead to fresh prosperity, it is natural and inevitable that the wage-earners should be filled with a deep distrust of any statement made by their employers concerning what is and what is not possible to be granted by industry. And it is not only owing to this distrust and bitterness that this policy on the part of employers has been short sighted. They might have recognized that for all the great staple commodities the wage-earning classes are already, and will be to an increasing degree, the most important consumers; and therefore that those who are engaged in making any product of general use will find it to their own interest that the general level of wages should be high so that there should be a good and steady demand for the product which they have to sell. It may be true from the point of view of the next balance sheet that it will pay any individual employer to pay as low wages as possible to his workmen, but he ought to recognize that what he needs is that all the workers in all other industries should be paid as well as possible and that he, by paying his own workers low, is doing what he can to depress the general level and so defeat his own objects in securing a market. This is quite apart from the wider question how far low wages involve cheap production. Up to a point, and as long as the wage-earners can be induced to give a fair day's work in return for their wage, experience has shown—especially in America—that high wages are an important item in cheapening production. Lately, and especially since the war, experience has shown that increases of wages have been followed by absenteeism on the part of the workers, and slack work while they are at work. Up to this point it should be the ambition of enlightened employers to pay the highest wages that the industry can stand. Capitalism increases its own efficiency and those of its wage-earners up to the point at which it enables them to improve their health and efficiency by paying higher wages; but when, as sometimes happens, the wage-earner simply has no use for any increase in his money receipts, then higher wages merely mean that he works fewer days in the week. The only remedy for this deadlock seems to be the education of the worker in the habit of accumulating for himself out of any surplus that he earns. If the wage-earners could thus be induced by accumulation to become capitalists themselves, it is possible that an improvement, the extent of which it is quite impossible to measure, might be secured in the relations between labour and capital.

Charges Examined.—If then we admit, as we must, that the early days of modern capitalism were marked by serious injustice inflicted on the manual workers, and that even to-day employers are much too ready to resist demands on the part of labour for improvements in its conditions, it must at the same time be remembered that these faults in the working of capitalism do not necessarily imply any essential injustice in the system or any blots upon it which cannot be improved out of existence. If the early employers, taking advantage of the unorganized state

of their workers, paid them too low for too long working days under working conditions which were a disgrace, it is also true that these conditions are in most industries, especially the best organized and most prosperous industries, a thing of the past. Moreover, the charge against capitalism, brought against it by the most extreme of its critics, is not merely that it has been in the past or is now unjust to those who work for it in the matter of hours and wages, but that the whole system is essentially based upon robbery, that the whole product of industry is really due to the exertions of labour, and that any interest or profit taken by the capitalist is necessarily a form of robbery. It is not a question of degree—that the capitalist has taken more than he is entitled to—but that the capitalist is not entitled to take anything at all, and that anything he takes is essentially a theft.

Labour's Capacity.—For this contention it is very difficult to find any real ground either in fact or in theory. Labour, in the sense of manual labour, by itself can effect nothing. Put down the most skilful hand-worker on a bare piece of ground and he cannot produce anything out of it until he has made himself tools and so become a capitalist; and, in the meantime, he would somehow have to feed himself on any roots that he could dig up, or any wild animals that he might be able to kill. Even if we include under labour the brain-workers and organizers, it remains true that any body of skilled workers, organized as well as possible under the most skilful management, would be equally ineffective without the assistance of the factory, tools, and other equipment which have to be supplied out of capital, that is to say out of the accumulation of past savings, before they can produce effectively. Labour by itself can effect nothing industrially or commercially; labour plus management is equally powerless. Capital by itself is, of course, in exactly the same position. Anyone who through the possession of capital owns a large supply of raw materials, and the necessary land, factory and equipment, can make nothing out of them without efficient management and efficient manual labour. These truisms are usually acknowledged by the extremist advocates of labour's claim to what is called the whole of its product. They admit that labour must have machinery and tools to work with; but Mr. Philip Snowden, for instance, the English Labour M.P., has contended that " the existence of a rich class who do no labour is the conclusive proof of the claim that labour does not receive all that labour creates, but that a surplus over and above the wages of labour is appropriated in some way and some form by those who do no work." But this argument begs the whole question by assuming that " labour creates " all that labour produces with the help of machinery. It seems to be based on a confusion of mind which imagines that because the machinery and equipment by themselves can produce nothing, therefore, those who work them and make them efficient are entitled to everything that is produced by their own efforts assisted by the machinery. In fact the existence of the machinery, which has been provided by the possibly idle capitalist, enables the manual workers to produce goods of an immeasurably greater volume and value than they could turn out without it. If labour is entitled to the whole of its product, as it surely is, it is also true that labour gets the whole of its product and a very great deal more, because, owing to the assistance given it by the machinery and equipment provided by capital, it is able to produce a very much greater volume of goods, and the bargain between it and capital results in its being better off than it could have been without capitalism's assistance.

To take an obvious example, let us suppose a man in a primitive stage of society to have hit on the idea of making a spade, and so greatly increasing his own production of food. If he then makes a second spade and lends it to a friend, enabling the latter to multiply his production and charging him a portion of the increased food for the use of the spade, then we see a rough analogy of the bargain which under capitalism is struck between capital and labour. In this case the friend who borrows the spade works for the capitalist who lent it, but he also works for himself. By the use of the spade his production is multiplied manifold; and to argue that he is entitled to take the whole amount of what he produces with the assistance of the spade, and that the man who invented and lent him the spade robs him by taking part of the increased production which it brings into being, is surely an example of astonishingly distorted logic. At the same time it has to be remembered that those who claim the whole product of industry for the manual workers can say that all the factories, means of transport, tools and machinery have actually been erected or produced by manual labour. But this manual labour, and the skill which organized it, were paid to produce these instruments by owners of wealth who were prepared to risk it on these objects. All these forms of the equipment of industry only came into being and increased the numbers and welfare of the whole community because some of those who controlled wealth when they were first invented used it to secure their manufacture and production instead of upon their own immediate enjoyment. At any time the future development of any country or community depends upon the extent to which its members are prepared to postpone immediate enjoyment to the provision of equipment for its further progress. If some of our ancestors had not made investments in industry in the past, and so equipped the world with all the machinery of industry and commerce, probably not half of us would now have been alive. Interest and profit are thus the reward paid for successful investment in the means of life in the results of which we all share.

Means of Production.—Critics of the capitalistic system are, at first sight, on firmer ground when they argue that it is wrong that anybody should possess, by the ownership of private wealth, this responsibility for the future development of the country or community; that injustice arises because private ownership makes it difficult and sometimes impossible for those who want to work to secure access to the means of production, and that a more equitable basis would be arrived at if all the means of production were owned by the state, or by some other public body, or, as is now contended by the syndicalists and guild socialists, by the industries which employ them organized into an all-embracing trade union or guild.

There can be no question that the existence of private property in the means of production does involve hardships and difficulties for those members of the community who do not happen to be born into the possession of property, or of the kind of qualities which enable them to acquire it rapidly. To such people, the ordinary unskilled workers, it must naturally seem unjust that if the kind and quantity of work that they offer to any private employer is not needed, some of them find great difficulty in earning a livelihood for themselves and their dependents. And the question that we have to consider is whether the hardships involved to a comparatively small number of the less fortunate members of the community are balanced by the advantages to the community as a whole involved by the working of the capitalistic system. Under that system anybody who by ingenuity and energy can earn more than his fellows is enabled and encouraged to do so and to devote his accumulations to the furtherance of industry by putting them out at interest, or engaging them in enterprises from which he hopes for profit. There is consequently a continued stimulus for activity and exertion, and it must always be remembered that this activity and exertion can only be successful if it produces something with which the community, as a whole, or a sufficient number of its members who are in a position to buy goods and services, are satisfied.

Thus, by this stimulus, the wants of the community have been continually considered and cared for by its most enterprising members, who are urged to do so by the hope of gaining profit. If this stimulus were taken away it is at least possible that progress would be very greatly retarded and that the interests of the community, as a whole, especially those of its poorest members, would be seriously affected. It has to be admitted that the wants of the community are not always wholly sensible and are very often marked by highly questionable taste. These drawbacks are surely to be best amended by the education of the community to a more sensible and tasteful use of the power that it has by its decision, through the manner in which it spends its money, concerning the goods and services which are turned out by industry. If the decision as to what is to be produced is to be

in the hands of a bureaucratic committee, as under state socialism, or of a guild or trade union committee, as it would apparently be under guild socialism or syndicalism, then it is perhaps possible, though highly doubtful, that the objects on which the productive enterprise of the community would be exercised might be more sensible and tasteful; but the general members of the community, having no power of choice, would not be exercising sense or good taste, but would merely be taking, whether they liked them or no, goods and services provided by the decision of an outside body.

Advances under Capitalism.—A more serious doubt arises whether under any alternative system that has yet been suggested the actual needs and necessities of the community would be successfully met. We have to admit that under capitalism there has existed and still exists a great deal of destitution and poverty which are serious blots on the success of the system. On the other hand, anybody who takes even a superficial and cursory view of the productive progress of the last century and a half under modern capitalism must admit that an enormous advance has been secured. There is no need here to enumerate all the miraculous inventions by which man's power over nature has been increased, and his productive capacity has been enormously multiplied. The extent of these powers was only fully realized when the World War came, and, in spite of the view expressed by some economists that a modern continental war could not last more than a few months because the economic strain would be too great, it was nevertheless possible to carry the war on for more than four years, to develop the production of lethal weapons during its course on a scale which has never heretofore been dreamt of, to feed and clothe the armies in the field much better than armies in the field had been fed and clothed before, and, at the same time, at least in England, to increase the standard of comfort of the greater part of the population. These achievements were in fact only carried out by making drafts to some extent upon the capital resources of the countries engaged, as, for example, when England sold back to the United States her investments in American railway bonds in exchange for food and munitions of war, which she was importing from America. But, when full allowance has been made on this score, the fact remains that the World War demonstrated a growth of productive capacity which had not been suspected until the supreme test aroused the energies of all the chief nations of the world.

But, apart from this astonishing effort at a time of crisis, we may take the prosaic facts of the last half of the 19th century as quoted by acknowledged champions of socialism. Mr. Sidney Webb, in his *Industrial Democracy*, speaks of "the past fifty years' rise in the condition of the English wage-earning class." Mr. Snowden, in his *Socialism and Syndicalism*, says that according to official figures between 1850 and 1900 the wages of the working classes in England had risen by 78%, and at the same time there had been a fall in the prices of wholesale commodities of 11%. This is surely a wonderful achievement which has to be granted as practical evidence of the efficiency of the capitalistic system, and of the extent to which its benefits were being shared with those who did its manual labour.

Mr. Snowden objected that the prices of wholesale commodities are not the best possible test of the buying power of the wage-earners, and that certain articles which they use had in fact risen. This may be so, but nevertheless the very great advance in actual money wages, accompanied by a quite appreciable reduction in the prices of many articles of general consumption, is a stubborn fact. This, indeed, Mr. Snowden to some extent admits, but he goes on to argue that this progress had stopped at the beginning of the 20th century, and that the tendency had then become permanent by which the share of the wage-earners in the product of industry was actually going backwards. This was certainly true in the first few years of the century, since the rise in wages, which still continued, did not quite keep pace with the rise in general prices. But Mr. Snowden's contention that this tendency was permanent was merely an assumption which might easily have been proved false even if the war had not happened. As we all remember, the World War came at a time when the manual workers of England were preparing a great attempt to improve their position, and there is every reason to assume that this attempt would have been successful. In any case, the war came and the general position of labour was certainly improved during its course. Since the war, the struggle between wages and prices to keep up with one another has been somewhat difficult, but it may at least be contended that this has been due not to an essential fault in capitalism, but because the wage-earners thought fit to restrict output in a mistaken belief that they would thereby resist any attempt to force them back to the pre-war standard, which they were rightly determined to avoid.

We have also to remember that under the sway of capitalism this very considerable improvement in the wage-earners' lot has been carried out in spite of an enormous increase in population. If it be admitted that the general standard of life before the World War was not all that it should be, it must also be admitted that the gift of life and all that life involves had been showered upon millions of people in all the economically civilized countries of the world, who could not have come into being if it had not been for the great increase of wealth under capitalism.

Weakness of the Alternatives.—One of the strongest arguments in favour of the present capitalistic system is the weakness shown by any system with which its critics would propose to replace it. State socialism has long been before the public as an alternative to the private ownership of capital. If it could be worked its economic advantages would be considerable, because it would mean that the state would own all the means of production and so would be the sole purchaser and the sole organizer and the sole distributor. The state would, therefore, decide what the needs of the community were, and how much work had to be done to provide them, and would set the members of the community to work to provide these things. All the waste involved by competition and advertisement would be saved, and all the mistakes in production would be avoided, which now arise because those who organize production have to try to foresee and forestall the needs of the public. The state would say what work each one of us was to do and what goods each one of us was to consume. If it were really possible that under this system we should work as well as we work now, there can be no doubt that the business of supplying the community's needs, as interpreted by the state, would be free from many of the joltings and jarrings which now often put the industrial machinery to some extent out of gear. But, in the first place, there is the enormously important question whether such a system could work at all—whether in fact the ordinary human being, as he is to-day, would be prepared to work at the bidding of the state, on conditions laid down by the state, with anything like the enthusiasm and readiness with which people work nowadays with the prospect of securing profit and advantage to themselves. Even if it be true that the great majority of commonplace people, who do not at present work with much enthusiasm or energy because they know that their own chance of achieving striking success is remote, would work for the state as well (or as indifferently) as they work now for private employers, there is very considerable doubt whether the more stirring spirits who think they can see their way to fortune in present circumstances if they work for it with determination, would put anything like the same vigour into work that they did for the state; it is upon the energy and readiness to take risks of this comparatively small body of stirring spirits in the community that economic progress really depends. If we stifle the incentives which now spur them to take risks and try experiments in the hope of fresh opportunities of profit, there is grave danger not only that the economic progress of the community might be checked, but that its whole economic organization might fall into decay and slothfulness, and that any attempt to improve or expand might be met with the same cold and unreceptive stare that now usually greets any new suggestion that comes up before officials of government departments. It might be possible in time to produce a set of officials who would be as ready and eager to promote the economic efficiency of the community as are the present captains of industry stirred by the incentive of profit. But past experience does not show that there

is much hope of this happening, at any rate for many years, and in the meantime any community which subjected itself to state socialism might find itself very much worse off. It is true that during the World War great feats were achieved by government departments in organizing the supply of food and of war munitions, but they were achieved because the spirit of the nation was stirred to meet the most momentous crisis in its history; and because government departments were able to rely upon the assistance and experience of a large number of men who came to work in them, who had been trained in the school of practical business based on the incentive of private profit. And even so, these official achievements during the war were only carried out at a cost which the country could not possibly have stood except for a comparatively short time; they also involved continual friction between government departments and the wage-earners whom they employed, and their general results were so unsatisfactory that it is now a commonplace, even among labour leaders who are most anxious to nationalize industry, that whatever happens "bureaucratic control" must not be allowed to take charge. "Government departments are in the worst of bad odours just now, and nothing which seemed to involve an extension of bureaucracy would have a chance at the polls"—so writes Mr. Gerald Gould, one of the latest exponents of socialist ambitions, in *The Coming Revolution in Great Britain*, published in 1920. How it is possible to organize nationalized industry without bureaucratic control has not yet been shown.

Nationalization.—The nearest attempt at solving this problem is made by the syndicalists and guild socialists, who do so by giving the nation remarkably little to say in the conduct of industry. Syndicalism in fact seems, as far as one can make out from the shadowy sketches that are obtainable of the desires of its champions, to ignore the state altogether. It proposes that the workers in any industry should seize the industry's capital equipment for themselves and work it for themselves. It is difficult to see how such a scheme could possibly be worked in practice. With each industry its own master there does not seem to be any means of arriving at any common denominator for the exchange of their products, that is to say, of arriving at a price, and the question of the provision of further capital seems to have been left out altogether. Guild socialism seems to be an attempt to reconcile syndicalism and state socialism and to arrive at a working compromise by a compound of the two. Unfortunately, its schemes as at present expounded seem rather more likely to suffer from a mixture of the drawbacks of both systems. The guild socialists consider that the capital equipment of industry should be owned by the state, but that the whole organization of industry, the decision as to what is to be produced, and the control of the product, are to be in the hands of those who work in it with brain or with hand. Here again we have the difficulty as to how we are to arrive at a means of exchange between one guild and another. If the shirt-making guild thinks that its members ought to get a pair of boots in exchange for two shirts, while the boot-making industry thinks that a pair of boots ought to be exchanged for three shirts, who is to decide between them and what power is to enforce decision? In the exceedingly vague sketches of the guild systems that have been produced by their champions, some attempts have been made to answer these questions. It is suggested that there would have to be a guild parliament representing all the guilds, a state parliament representing the consumers, and apparently yet another parliament which is to settle matters when these two parliaments cannot agree. Obviously there are materials here for economic chaos. It is true that if everybody worked with a perfectly angelic spirit such a system might possibly be able to carry on the work of production, but if everybody had an angelic spirit any system, even capitalism, would also be highly successful. But the guild socialists have to admit that, if any particular guild which was strong enough chose to hold a pistol at the head of the rest of the community by refusing to work except on its own terms, serious difficulty would arise. In fact, some of its more candid advocates have stated frankly that the wage-earners might conceivably be a good deal worse off under guild socialism; but they seem to think that a diminution in their actual control of goods and comforts would be more than compensated by the greater freedom they would enjoy, and by the feeling that they were no longer working to profit a private capitalist.

Economic Tyranny.—How much truth is there in this claim for the greater freedom to be enjoyed by the wage-earners under guild socialism? One of the principles on which its champions most strongly insist is that production and the control of the product are to be in the hands of the guildsmen themselves, and that, consequently, they will be able to insist on producing goods which they think should be produced, rather than goods which consumers would prefer to consume. One of their champions, Mr. G. D. H. Cole, even goes so far as to mention the right to "choose whether they will make well or ill" as one of the things which must be secured for the workers under guild socialism. Certainly the right to work well or ill is a very large extension of freedom of a kind, but is it likely to react in favour of freedom in the fullest sense of the word? As industry is now organized under the principle of the division of labour, every one of us produces or helps to produce one article or fraction of one article, but we consume hundreds of articles. Economic freedom, that is to say, freedom to provide ourselves with such goods as we should like to consume, thus seems to be much more real under capitalism, which gives us the right to spend our wages and salaries as we please, than it would be under state socialism or guild socialism. State socialism would tell us what work to do and what goods to consume; and guild socialism, though apparently leaving to us, when once members of a guild, the right to decide along with our fellows concerning the goods that we will produce, and also as to whether we will work well or ill, would nevertheless leave us dependent upon the decisions of the other guilds as to what kind of goods they chose to produce, and upon the inclination to work well or to meet our demands with shoddy and ill-made commodities. Since this is the kind of freedom which is held out to the wage-earners under these rival systems, there certainly seems to be good reason why they should think many times before taking a leap in the dark by adopting them.

Capitalism and Progress.—Such are the doubts and difficulties that face us when we contemplate the practical working of any alternative so far suggested to capitalism. For it, on the other hand, we can at least claim that, with all its faults, it has achieved a marvellous improvement in the command of man over natural forces; and has produced an enormously greater amount of wealth, which has been distributed, though in a manner which leaves a good deal to be desired, over a greatly increased population. Along with this purely material improvement there has proceeded a great expansion in education, sanitation and social reform. Capitalism can certainly lay no direct claim to the whole of this expansion, a great deal of which has been brought about, in spite of the opposition of the propertied classes, by a few enthusiasts, educational and scientific; but capitalism can fairly claim that these enthusiasts could not have done their work if there had not been available the surplus supply of wealth which was called into being by the efforts of private enterprise working with the incentive of profit. A noted labour leader has recently said that capitalism has made England a "C.3" nation. But this description is more rhetorical than accurate. England's achievements by land and sea, during the World War, and likewise those of her Allies and enemies, who had also developed their resources under a capitalistic system, were such as to astonish those who had anticipated that the drift of the populations into great towns, and their occupation under sedentary conditions, would make it difficult to find armies who could fight with the spirit in which armies fought in former days. In fact, armies were produced in proportion to the population on a scale previously undreamt of, and fought an almost continuous battle for four years, showing unprecedented courage under conditions that no armies had hitherto been asked to face. The spirit and physical power of the countries which have grown into material greatness under the capitalistic system certainly show no sign of demoralization. At the same time it is true, as has already been admitted, that the blot of destitution is one which has to be

erased from the record of capitalism before it can claim to have produced a system which is really worthy of what is called civilization. If capitalism is to continue it will clearly have to remedy this evil and others which have already been mentioned. The leading spirits among those who are interested in its maintenance are fully aware that these things have to be remedied. In fact the change of attitude on this point among employers in recent years almost amounts to a revolution, though there are still too many obstructive exceptions. Associations formed for the face-to-face discussion of these points by employers and employed are already common, and, on the side of the employers, it is certainly true that (perhaps under the spur of self-interest) they are earnestly trying to repair the weaknesses in the system which they have to work. Their difficulty is to know what it is that labour really wants; what concessions can be made which will induce labour to work the capitalistic system with hearty coöperation. Improved conditions, higher wages, and greater influence on problems of management, the best of them are more than ready to grant if only they can secure in return for them active work during the time when the manual labourers are engaged on their job, and the renunciation of the policy of the restriction of output. It would appear from the utterances of those who consider themselves entitled to speak for labour, such as Mr. Sidney Webb and Mr. Cole in England, that labour has made up its mind that it is not going to work in future to put profits into the pockets of private employers; in other words, it is determined to end the capitalistic system. Whether the rank and file of manual workers have really adopted this extreme view may very well be doubted, but they are extremely likely to adopt it unless they can be granted greater security. This is certainly a demand on the part of the manual worker which will have to be met by capitalism if it is to survive. The anxieties of the ordinary manual worker, who does not know how soon he may be told that he is no longer wanted at his job, should always be present in the minds of the employers, and if the schemes now being mooted by which every industry should make itself responsible for its own unemployed can be brought into practical effect, there can be no doubt that one of the worst evils of capitalism will have been abolished.

Another reform on which the manual workers seem likely to insist is a clearer statement of the costs and profits of industry. At present the accounts published by joint stock companies usually only succeed in making darkness visible. Labour has so often been misled as to the capacity of industry to stand concessions to it, that employers will be well advised to produce a more scientific system of accounting, by which they can be able to prove to demonstration what the true costs of industry really are, how much is required for depreciation and upkeep, how much goes to labour and management and how much is taken by capital.

As to the sordid ugliness with which capitalism is usually charged, everyone who has visited an English north-country industrial town must admit that the system in its craving for cheap production has ignored many things which make life tolerable for those who work for it, and has therein shown only another example of short-sightedness for which it now has to pay. Even on this point, however, one feels a certain doubt whether any alternative scheme of state socialism or guild socialism would provide the community with the necessary leisure and surplus wealth that could be devoted to the beautification of the country which adopted it, as is too usually assumed. If everybody is to have a nice house and live in pleasant surroundings, production has to be organized so as to be not only comfortable for those who are engaged in it, but efficient in the matter of output. And, on this subject, as has already been shown, there is good reason to doubt the efficiency of alternative schemes.

Inherited Wealth.—Another of the weaknesses of the capitalistic system is the power that it gives to owners of wealth to continue to accumulate it and pass it on to their heirs and assigns, with the result that a class is created which is able to live in great luxury on the past efforts of their ancestors, relatives, or friends, without making any effort to justify their own existence. There can be no doubt that the existence of these huge fortunes, accumulating and being passed on, are a source of great bitterness among the classes which do not possess them. Much might be done to alleviate this bitterness if all the owners of this wealth, and not only a certain number of them, were careful to make a more public-spirited use of it. It is true that they owe it to the work and exertions of others who have passed on this wealth to them, but this is only partially so. A large part of it they really owe to the existence of an ordered society providing a market and outlet for the efforts of those who accumulate the wealth and a machinery for investing it and reinvesting it, and so increasing it from generation to generation. From this point of view a large part of their great wealth they owe to the community in which they live, and the assumption that it is their own to do what they like with is a dangerous one which will cost them dear if put into practice too logically. It is possible, however, that this evil may be cured, at least to a great extent, by the development of death duties and inheritance taxes, which seems likely to be an increasingly important part of the fiscal arrangements of civilized nations in time to come. Here again, however, there is danger that if this remedy is exercised too freely the process of accumulation which is required to provide the community with capital for fresh enterprise may be dangerously checked. For the evil of huge fortunes is balanced by the fact that it is largely from them that accumulations of new capital on a great scale are effected; and it is highly dangerous to diminish them by the use of the fiscal weapon, before the duty of saving and accumulating has been effectually brought home to those classes of the community which are now accustomed to spend all that they earn or receive.

Need of Extended Capitalism by Savings.—The efforts made in England and America and elsewhere, during the war, to try to induce everybody to save for victory have had effects which astonished those who were most closely acquainted with the thriftlessness of ordinary human nature (*see* SAVINGS MOVEMENT). Long before then the coöperative movement had already developed a new and very interesting form of capitalism among the wage-earning classes. Coöperation is sometimes described by its own champions as an effort directed to the overthrow of private capitalism, but it is in fact merely a variation of it. Coöperation assembles the shillings and pounds of the wage-earners and puts them into productive and distributive industry, especially the latter, with marked success. The division of the profits is effected on different lines, those of the retail shops being divided among the purchasers in accordance with the amount of their purchases. So far its successes have been won on a somewhat narrow field, but there is no reason why they should not go ahead at a greatly accelerated pace as the higher earnings of the workers give them a larger margin available for saving. If this tendency could be continued,—if good work, rapid production, and high wages could be accompanied by individually small accumulations of capital by the great mass of the wage-earners, and if they could thus be induced to become not only wage-earners but themselves also capitalists, and if, at the same time, the large capitalists could be induced to see that the use they make of their incomes and of their leisure is a matter which concerns the community as well as themselves,—then it might be possible to arrive at a state of affairs in which every worker was a capitalist and every capitalist a worker, and capitalism, shorn of many of its worst evils, might work miracles of industrial production.

CAPORETTO, BATTLE OF.—The Italian offensive[1] of Aug.-Sept. 1917 had reduced Borocvić's armies to the limit of resist-

[1] See generally under ITALIAN CAMPAIGNS.

ance, so much so that, as Ludendorff records, "the responsible military and political authorities of the Dual Monarchy were convinced that they would not be able to stand a continuation of the battle and a twelfth attack on the Isonzo. . . . In the middle of Sept. it became necessary to decide for the attack on Italy in order to prevent the collapse of Austria-Hungary."

Though the Italian advance on the Bainsizza plateau had come so near to a definite break through, it had left the Italian II. Army badly placed for defence. South of Tolmino the Aug. fighting had bitten out a wide salient on the Bainsizza plateau. North of Tolmino the Italians were still in the positions they had occupied early in the campaign, among the mountains on the left bank of the Isonzo, with comparatively little room between the trenches and the river. Neither sector of the line was satisfactory for defence, and on the Bainsizza there had been little time to make adequate preparations, because of the rocky nature of the ground. But the real weakness of the situation was due to the enemy's possession of the Tolmino bridgehead. The bridgehead itself was strong, as it did not form a salient, the Austrian line running nearly due N. and S. from the great ridge of Rudeci Rob (6,250 ft.) by Mrzli and Vodil Vrh to the high hills of the Lom plateau, N. of the Bainsizza. The bridgehead was well protected by these flanking bastions, and for this reason it made an excellent point of departure for an attack. The ridges in front of it rose steeply, and were strongly held by the Italians, whose position, however, suffered from two grave drawbacks. In the first place it was impossible to support the defence by direct flanking fire against attacking troops; in the second place, there was little depth in the lines traced on the Zagradan-Jeza ridge, which fell rapidly to the head of the Judrio valley and the glens which carry the minor streams between the Judrio and the Natisone.

There was a clear difference of opinion on the Italian side as to the best way of meeting the forthcoming attack. Cadorna was convinced that he had to stand on the defensive, the more so as he was uncertain in which sector of the Julian front the chief blow would fall, but his instructions naturally included and recommended vigorous local counter-attacks. Capello, who commanded the II. Army, did not like the idea of the defensive. His army was in the main aligned for attack. Preparations had been made for a continuation of the offensive which had been broken off in Sept., and it was not possible, given the difficulty of communications and the risk of imminent attack, to take up those positions best adapted for defence. He felt, in addition, that opposite the Tolmino bridgehead he had little room for defence, and he was anxious to anticipate the enemy's move by an attack N.E. from his positions on the Bainsizza plateau. In this idea he had the support of more than one of his corps commanders, but Cadorna thought, and it is difficult to meet his reasoning, that he could not throw in the forces necessary for such an attack when he was uncertain as to the direction of the forthcoming blow. His first news from the enemy side spoke of an attack against his new lines on the Bainsizza. Later came the report of a more general attack, "from Plezzo to the sea." The enemy believed that Cadorna had been deceived by demonstrations made in the Trentino, and their belief was fortified by news that he was sending guns westward. But these were the French and British heavy guns (nearly 200 in number), which had been withdrawn when he stated that he could not renew his offensive, and a number of batteries now restored to the Trentino front, which had been stripped for the earlier fighting.

Cadorna was still preoccupied about the *moral* of his troops, and he made careful inquiries on this point, which received very satisfactory replies. He was especially anxious as the units which had suffered heavily during the last offensive were but newly filled with fresh drafts, and he had found reason before to fear the influence of some of the men fresh from the depots. But the answers of his corps commanders were thoroughly reassuring. He had enough men, though a number of his units were below strength, while others were battle-worn and others again had suffered much from an intestinal disease that had been prevalent in the valleys of the Natisone and the Judrio; and he had enough guns, in spite of the withdrawal of the Allied artillery, though he would doubtless have been glad of a larger reserve. Between Monte Rombon and Monte San Gabriele, Capello had some 2,200 guns and nearly 800 trench mortars.

North of Tolmino the line on the left bank of the Isonzo was held by Cavaciocchi's IV. Corps, whose left wing held the Plezzo basin and was in contact with the Carnia Force on Monte Rombon. Next came Badoglio's XXVII. Corps, whose left wing, the 19th Div., raised to the strength of an army corps, held the lines opposite Tolmino. The other three divisions which completed the XXVII. Corps were across the river S. of the Lom plateau. Behind the 46th and 19th Divs., on the mountains W. of the Isonzo, lay the VII. Corps, newly reconstituted with units from other corps, and commanded by Gen. Buongiovanni. On the right of the XXVII., holding the line as far as the Sella di Dol between Monte Santo and Monte San Gabriele, were Caviglia's XXIV. Corps and Albricci's II. Corps, each of three divisions, with the XIV. Corps in immediate reserve. The Gorizia sector, from Monte Santo to the Vippacco, was occupied by the VI. Corps (Gatti) and the VIII. (Grazioli). South of the Vippacco the Duke of Aosta's III. Army had three corps (seven divisions) in line—XI., XIII., and XXIII.

The weak point of the Italian line was the Tolmino sector, the weakest part of this sector was at the junction of the XXVII. Corps (19th Div.) with the IV. (46th Div.), and the weakest position of all was that held by the right of the 46th Div., who were clinging to the slopes of Mrzli Vrh, completely dominated by the enemy, and badly off for communications with their neighbours. The Tolmino sector was chosen for the main enemy attack, and here, owing to a complex of circumstances, the Austro-German forces won a success that led to a great Italian disaster. In anticipation of the main drive in this direction, the II. Army reserves (XXVIII. Corps and various other units) were lying N. of Cormons, while three divisions under the direct control of Cadorna waited between Cormons and Cividale, at the foot of the valleys that run down S.W. from the threatened point. A further general reserve consisting of the XXV. (four divisions) and XXX. Corps (two divisions) lay about Palmanova, ready to be sent N. or E., according as the fighting developed.

The Italian preparations were much handicapped by the illness of Capello. From the beginning of Oct. the commander of the II. Army was seriously unwell, and though he had the assistance of Gen. Montuori, who was brought to Army Headquarters from the II. Corps, the II. Army undoubtedly suffered much from Capello's physical unfitness. Montuori had only taken command of the II. Corps a few weeks before; he had come from the Asiago uplands and knew little or nothing of the II. Army front. On Oct. 20 Capello left for Padua, in the hope of securing a short rest, leaving Montuori in command. His rest lasted less than two days; for when the imminence of the enemy attack was confirmed by two deserting enemy officers, of Rumanian nationality, he returned to resume his command, reaching Cormons late on the night of Oct. 22.

The main attack came in the direction anticipated, between Monte Rombon and S. of Tolmino, and was conducted by a mixed German and Austrian army under Gen. Otto von Below. The army, which was known as the XIV. Army, consisted of nine Austrian divisions and seven German, divided into four "groups." The northern group of four divisions (three Austrian and one German Jäger) was commanded by Krauss, who had been called back from the Bukovina. Next came a group of three divisions (one Austrian and two German) under the German von Stein, and a group of two German divisions under the German von Berrer. South of these two central groups was a mixed group under the Austrian von Scotti (commander of the Austrian XV. Corps). This group consisted of one German and two Austrian divisions. Behind these, E. of Tolmino, lay four divisions in reserve, at Below's immediate disposal. Boroević had 20 divisions in his two "Isonzo" Armies between Auzza and the sea. Below and Henriquez (II. Isonzo Army) had some 2,500 guns and 500 trench mortars.

erased from the record of capitalism before it can claim to have produced a system which is really worthy of what is called civilization. If capitalism is to continue it will clearly have to remedy this evil and others which have already been mentioned. The leading spirits among those who are interested in its maintenance are fully aware that these things have to be remedied. And, on this subject, as has already been shown, there is good reason to doubt the efficiency of alternative schemes.

Inherited Wealth.—Another of the weaknesses of the capitalistic system is the power that it gives to owners of wealth to continue to accumulate it and pass it on to their heirs and assigns, with the result that a class is created which is able to live in great luxury on the past efforts of their ancestors, relatives, or friends, without making any effort to justify their own existence. There can be no doubt that the existence of these huge fortunes, accumulating and being passed on, are a source of great bitterness among the classes which do not possess them. Much might be done to alleviate this bitterness if all the owners of this wealth, and not only a certain number of them, were careful to make a more public-spirited use of it. It is true that they owe it to the work and exertions of others who have passed on this wealth to them, but this is only partially so. A large part of it they really owe to the existence of an ordered society providing a market and outlet for the efforts of those who accumulate the wealth and a machinery for investing it and reinvesting it, and so increasing it from generation to generation. From this point of view a large part of their great wealth they owe to the community in which they live, and the assumption that it is their own to do what they like with is a dangerous one which will cost them dear if put into practice too logically. It is possible, however, that this evil may be cured, at least to a great extent, by the development of death duties and inheritance taxes, which seems likely to be an increasingly important part of the fiscal arrangements of civilized nations in time to come. Here again, however, there is danger that if this remedy is exercised too freely the process of accumulation which is required to provide the community with capital for fresh enterprise may be dangerously checked. For the evil of huge fortunes is balanced by the fact that it is largely from them that accumulations of new capital on a great scale are effected; and it is highly dangerous to diminish them by the use of the fiscal weapon, before the duty of saving and accumulating has been effectually brought home to those classes of the community which are now accustomed to spend all that they earn or receive.

Need of Extended Capitalism by Savings.—The efforts made in England and America and elsewhere, during the war, to try to induce everybody to save for victory have had effects which astonished those who were most closely acquainted with the thriftlessness of ordinary human nature (*see* SAVINGS MOVEMENT). Long before then the coöperative movement had already developed a new and very interesting form of capitalism among the wage-earning classes. Coöperation is sometimes described by its own champions as an effort directed to the overthrow of private capitalism, but it is in fact merely a variation of it. Coöperation assembles the shillings and pounds of the wage-earners and puts them into productive and distributive industry, especially the latter, with marked success. The division of the profits is effected on different lines, those of the retail shops being divided among the purchasers in accordance with the amount of their purchases. So far its successes have been won on a somewhat narrow field, but there is no reason why they should not go ahead at a greatly accelerated pace as the higher earnings of the workers give them a larger margin available for saving. If this tendency could be continued,—if good work, rapid production, and high wages could be accompanied by individually small accumulations of capital by the great mass of the wage-earners, and if they could thus be induced to become not only wage-earners but themselves also capitalists, and if, at the same time, the large capitalists could be induced to see that the use they make of their incomes and of their leisure is a matter which concerns the community as well as themselves,—then it might be possible to arrive at a state of affairs in which every worker was a capitalist and every capitalist a worker, and capitalism, shorn of many of its worst evils, might work miracles of industrial production.

CAPORETTO, BATTLE OF.—The Italian offensive[1] of Aug.-Sept. 1917 had reduced Borocvić's armies to the limit of resist-

[1] See generally under ITALIAN CAMPAIGNS.

aside the spasmodic opposition of such small detachments as came in its way. The Austro-German advance was facilitated by the fact that Cavaciocchi had filled his front lines too full, and sent all his reserves across the river, in immediate support of the 43rd and 46th Divisions. When Lequis was approaching Caporetto Cavaciocchi had nothing in hand but a squadron of cavalry and one battalion of infantry which had not yet reached its destination E. of the river. For some hours previously Cavaciocchi had been calling on the VII. Corps, but Buongiovanni was very slow, not without excuse. His Corps was a scratch formation; his original left-hand division had been broken up two days before to strengthen the IV. and XXVII. Corps, and the 62nd, which had been assigned to him in its stead, was only moving up to take its place N. of the 3rd, already aligned, but too far back, on the ridge running N.W. from the Passo di Zagradan. A further difficulty was that no definite plan of action had been agreed on between Cavaciocchi, Buongiovanni and Badoglio, whose close coöperation was clearly necessary. Or, if a plan had been made, it was one which had been completely upset by the rapid successes of the enemy. In fact, as has been shown already, Badoglio had little idea of how the fight was going on his front; Buongiovanni was in the dark regarding the general situation except for the calls which came from Cavaciocchi; and Cavaciocchi, who saw his own danger, had played his cards too soon, and had nothing left. Krauss records the satisfaction he felt when he observed that the additional troops given to the IV. Corps on the eve of the battle were sent forward instead of being held in reserve.

By the evening the situation was very favourable to the attacking forces. Stein was pouring troops through the breach made by the Silesians, and was making good headway with the 50th Austrian division on their right, while the Alpenkorps, Berrer and Scotti had broken through the lines opposite Tolmino, and in several places had gained the high ridge dominating the head of the Judrio valley. Krauss was still held up at Saga and on Polounik, and the Bosnians had gained no more ground. But the break-through between Tolmino and Caporetto had made these positions untenable.

At Cividale, where Capello had his headquarters, and at the Comando Supremo in Udine, the first news that came from the IV. Corps and the absence of news from the XXVII. made a grave impression. Capello sent up the army reserves by the valley roads, and dispatched Montuori to direct the "left wing" (the IV. and VII. Corps). This was a step which might with advantage have been taken earlier; indeed, the II. Army might well have been further divided and, if necessary, made into an army group. It was too large, and covered too wide a front, for a single army command.

By evening the magnitude of the initial enemy success was clear, though it was not yet clear to what extent the whole Italian left wing was crumbling. There seemed good reason to hope that the advance might be blocked in the narrow valleys west of the Isonzo. But by nightfall both the IV. Corps and the 10th Div. were practically broken in pieces. Saga had to be abandoned owing to the break farther S., and the 50th Div., or what was left of it, retired into the Val d'Uccea and on to the ridge of the Stol, which was reached later by the remnants of the 43rd, who had held their own bravely, but were in great part cut off when they attempted to come back across the Isonzo. A gallant detachment (Alpini and details of the Etna brigade), finding retreat impossible, held out for days on Monte Nero till the battle had gone far to the W., and all their food and ammunition were gone. The 46th Div. was practically destroyed, many having surrendered when they found the enemy at their backs, and others having joined the masses of supply service troops which were now filling the roads. The 62nd Div. (VII. Corps) was beginning to be attacked at Luico, while its left was extending to occupy Monte Matajur and join hands with the 53rd, which had been dispatched by Capello to block the Natisone valley. The 3rd Div. was still in its old position, but it was now being attacked in front and its right was uncovered by the defeat and practical destruction of the 19th. The right wing of the 19th was still holding on Globocak and had been reënforced by the 1st Bersaglieri Brigade; Alpine troops still held a line down to the river, though they had been driven off their original positions on Krad Vrh, and troops of the 64th were being brought back from the left bank to strengthen this line. It was obvious that the positions on the Bainsizza could not be maintained. Capello had already transferred Badoglio's division beyond the river to the command of the XXIV. Corps (Caviglia), and the order had been given to Caviglia and Albricci to withdraw their troops to their main lines of defence and to the former to prepare for a retreat across the Isonzo.

At this moment the most dangerous point appeared to be the extreme left wing, where the 50th Div. had lost touch with the Carnia force, and only the Potenza brigade, of three regiments, but much weakened by disease, was available as a reserve. And the Potenza brigade was wanted farther south. Two Alpine groups were already on the way to this critical point, having been dispatched the day before, but it was clear that Krauss would try to push through by this route, the shortest way to the Tagliamento. The occupation of Caporetto threatened to open another route nearly as short, but the possession of Monte Maggiore and the Stol, together with Monte Matajur, gave good hope that the advance of the enemy might be quickly brought to a halt when it had outrun the protecting fire of its own guns. Cadorna ordered the Carnia force to occupy Monte Maggiore and block the Val d'Uccea "at all costs," and sent up a division to support the troops on the Stol. He gave orders for resistance to be made on three successive lines, but all of these radiated from Monte Maggiore, which was the key position. He gave orders for resistance on these lines, but at the same time he directed that plans and orders should be drawn up for a general retreat to the Tagliamento. This was a precaution only; at the moment, though the situation looked grave, there seemed little reason to doubt the capacity of the II. Army, and the reserves already under way, to stem the enemy's offensive.

Next morning Cadorna warned the Duke of Aosta of the danger of the situation, and directed him to send his less mobile heavy artillery W. of the Piave and prepare for a retreat beyond the Tagliamento. Tassoni, who commanded the Carnia force, was also directed to prepare for a withdrawal of his troops.

The news on the morning of Oct. 25 was increasingly grave. Krauss was pressing upon the Stol, and finding a weak resistance; the Potenza brigade was falling back from Creda; Monte Matajur had fallen, practically undefended. Other positions were seriously threatened, and there was no confidence that they would be held. For it was now known in Cividale and Udine that the behaviour of some of the troops had been very unsatisfactory, that men of some units had been quick to surrender, while others had retreated before they were heavily attacked. And this unexpected lack of spirit was communicating itself to some of the reserves. These had a difficult task in getting to the scene of action, for as they marched up the narrow mountain roads they were met by ever increasing masses of fugitives, the bulk of these belonging to the non-combatant services. The confusion and congestion on the roads may be estimated from the fact that in the area of the IV. Corps alone the number of non-combatant troops exceeded 30,000. Somehow the word went round, among combatants and non-combatants alike, that the war was over and that there was nothing to do but "go home." Perhaps the cry was raised by enemy troops disguised in Italian uniforms, for some of these were found; more probably it was started by some who had drunk in the Socialist catchwords, pronounced by the deputy, Signor Treves: "This winter no one must be in the trenches"; who had believed the promise that if they laid down their arms the enemy would do likewise. It was an extraordinary case of collective deception, which hastened the break-up of Capello's whole left wing.

A gallant resistance was still being made at various points, notably at Luico and Globocak, but the enemy had broken through at several positions of vital importance, and, as has been said, the reserves were becoming entangled in the crowds of fugitives, and some of them were becoming infected. **On the**

afternoon of Oct. 25 Capello, who could fight no more against an illness to which he ought perhaps to have given in sooner, and had been told by the chief medical officer of the army that he must resign his command, proposed to Cadorna an immediate retreat to the Tagliamento. His argument was that it was useless to send in more reserves to the chaos among the hills west of the Isonzo; that the only way to remedy the situation was to withdraw the bulk of the armies " from close contact with the enemy under the protection of vigorous rearguard actions," and so make possible the organization of a solid defence and eventual counter-attack. Cadorna agreed as to the probable necessity of retreat, but he was doubtful as to whether it should be immediate. He felt that unless he could delay the enemy advance down the Natisone and Judrio valleys by more than a mere rearguard action he ran the risk of having his centre and right, and all the mass of troops in the Udine plain, cut off from his bases. Montuori, who now succeeded Capello in command of the II. Army, was of opinion that he could hold on a line from Monte Maggiore to Monte Carnizza and thence across the valleys to Monte Korada. Cadorna decided to attempt the further stand, and, as the II. Army was obviously too large for movement, the left wing was given to Gen. Etna, late of the XXX. Corps, and the right to Gen. Ferrero, late of the XVI., while Gen. Sagramoso, who commanded the XIV. Corps, in reserve on the Isonzo, was charged with the duty of organizing a reserve line of defence on the river Torre. Tassoni, Di Robilant (IV. Army) and the Duke of Aosta were all warned to hold themselves in readiness for retreat, Di Robilant being told to send his big guns at once W. of the Piave to between Pederobba and Montebelluna. The VIII. Corps was detached from the II. Army and given to the Duke of Aosta, who was already forming a reserve line on the western rim of the Carso, preparatory to the withdrawal of his main body. Gen. Di Giorgio was sent northward, with two divisions from the general reserve, to occupy both banks of the Tagliamento in the region of Pinzano.

Cadorna hoped to hold, for a time at least, but at midnight on Oct. 26 he was wakened to hear the news that Monte Maggiore had fallen. He at once drew up the orders for a general retreat beyond the Tagliamento, and his plans were already matured for the longer retreat, across the Piave, which he foresaw would probably be necessary. Next day the weak resistance of the II. Army rearguards and the increasing number of disbanded soldiers confirmed his impressions. He saw, too, that there was, literally, no room to bring the II. Army back in good order. He was determined to keep the southern roads clear for the III. Army, and this meant that the retiring units of the II. Army would be so hampered by disbanded soldiers and fugitive civilians that most of them could scarcely hope to get back as units. In the circumstances he had to count out the greater part of the II. Army and fall back on a line that could be held by a smaller number of troops. It was only to gain time that he attempted a stand on the Tagliamento. Provisional orders and plans for a retirement to the Piave were issued on Oct. 20. The mournful retreat began on Oct. 27, and the prospects were rendered still more serious by the fact that the Tagliamento came down in sudden and violent flood. The fords could not be used; several existing bridges were carried away, and attempts to throw new bridges were unsuccessful. The danger of losing more men and guns on the retreat became still greater.

Fortunately for Italy, and for the cause of the Entente, the Germans and Austrians were, in part at least, outrunning their transport. Krauss complains that only he and Krafft von Delmensingen, Below's chief-of-staff, had been inspired by adequate ambitions for the attack. The objective had been Cividale, or, at best, the Tagliamento. Krafft thought they should have had the Adige in view. Krauss expressed the opinion that the real objective should have been Lyons. Without taking Krauss's aspirations too seriously, it may well be believed that if the German and Austrian Commands had worked out a bigger plan they would have done even more than they did do. But the transport difficulties were very great; Germany could not spare troops or material to make an unlimited effort on the Italian front, and the unexpectedly weak resistance of the Italian II. Army could hardly have entered into the calculations of those who were bound not to take too many risks. Krauss himself admits that if the Italians had held the Stol in strength his own move would have been frustrated.

Krauss, Stein, Berrer and Scotti were very quick in their pursuit, and Berrer paid for his haste with his life. He was shot by an Italian *carabiniere* at the gates of Udine on Oct. 28, the day on which his advance guard entered the town, less than 20 hours after Cadorna and his staff left for Treviso. His place was taken by Hofacher. The Italian covering troops were delaying the enemy advance, and giving time for the III. Army, fighting a strong rearguard action, to come back across the Tagliamento. Henriquez had difficult mountainous country to cross before he reached the plain, and both he and Wurm were held up on the Isonzo, where the bridges had been destroyed by the retreating Italians. The critical days for the Italians were Oct. 30 and 31, when the pressure from the N. and E. threatened the flank and rear of the III. Army, whose task had been rendered more difficult by the fact that the permanent bridges at Casarsa had been blown up prematurely, owing to a false alarm. Many guns had to be left on the eastern bank, including 46 heavy batteries, which had been brought all the way from the Bainsizza. The Tagliamento was falling, however, and a number of troops succeeded in fording the river. It had been impossible to keep the Casarsa bridges for the III. Army, as several units of the II. and a large number of disbanded men had been forced down by the pressure from the north. But on the afternoon of Oct. 31 the Duke of Aosta was able to inform Cadorna that all of his rearguard, with the exception of four brigades, who were holding a defensive bridgehead covering Madrisio, had passed the Tagliamento. The bulk of this rearguard crossed the same evening, and only a small bridgehead was held at Latisana. A considerable number of II. Army troops, having failed to cross the river at Casarsa, were coming down towards Latisana pursued by Scotti's vanguard and threatened on the flank by Henriquez. Some of these succeeded in crossing at the Latisana bridges, but the enemy attacked in considerable force the following day, and a large number of Italians were cut off and taken prisoners. By the evening of Nov. 1, the left bank was entirely in the possession of the Austro-German armies.

Krauss tells a remarkable story according to which both Below, with Scotti's group, and later, Goiginger, with the right wing of Henriquez's army, wished on reaching the Tagliamento to swing S., and cut off the Duke of Aosta's army, which, Krauss maintains, was still some distance to the east. According to Krauss, Boroević refused to allow Scotti to encroach upon his line of march, and forbade Gen. Ludwig von Goiginger to come S. of the line marked out for the II. Isonzo Army. But before Scotti was in a position to carry out the manœuvre which Below is reported to have proposed, the bulk of the Duke's army was already across the Tagliamento, and his last four brigades were more than capable of dealing with anything Scotti could then bring against them. Before Goiginger was on the spot the whole of the III. Army had passed the river and there were on the eastern bank only the broken troops who had come down from the N. in a last attempt to find a way across. Krauss's remark, that " Boroević had saved the Italian III. Army," has no foundation. Boroević knew more about the III. Army than the " German staff officers or Goiginger, who were Krauss's authorities." Krauss also asserts that the manœuvre would have led to the capture of the King of Italy and of Cadorna and his staff, a statement for which, though furnished by " a neutral crowned head," there are no grounds whatever.

Cadorna did not expect to stay long on the Tagliamento, but he did hope to hold up the enemy long enough to give adequate time for the retreat of the Carnia force and the IV. Army, and to organize a strong defensive line on the Piave. His weak point was the stretch of the river W. of Tarcento, for which Krauss and Stein were making with all speed. Two divisions under Di Giorgio had been dispatched to hold this line, but

their march, at right angles to the line of the retreat and athwart the long streams of retiring troops and civilians, had been very difficult. Stein's troops, however, failed to cross the Tagliamento, their attempts being repulsed with heavy loss. It was left to Krauss's Bosnians, after vain attempts to ford the river, to cross by the half-broken railway bridge at Cornino, on the evening of Nov. 2. The Bosnians had crossed by nine o'clock, surprising and driving back the small detachment watching the bridge. The following morning Di Giorgio was strongly attacked at Pinzano and Krauss established a sufficient bridgehead. On Nov. 4 Di Giorgio's left was pushed back still farther, endangering the line of retreat for the Carnia force divisions, and once more threatening the whole Italian line with envelopment from the north. For Stein was sending troops across to reënforce Krauss, and incidentally, according to Krauss, to claim the credit which was due to the Bosnians alone.

On the morning of Nov. 4 Cadorna ordered the retreat to the line of the Piave, and that night the troops holding the line of the Tagliamento resumed their march westward. Cadorna's main preoccupation was now for the IV. Army, which had been slow in getting under way, and for the Carnia force. Di Robilant wished to hold on in Cadore. It was natural, perhaps, that he should not have realized fully and at once the urgent necessities of the situation, but his hesitation to act promptly in accordance with Cadorna's instructions exposed him to the danger of having the retreat of his right wing cut off. For the safety of his route to the new positions assigned to his army depended now on the ability of the left wing of the worn-out II. Army to hold back the pressure of Stein's troops. Krauss's group had been sent N.W. through the mountains to the Upper Piave, to establish contact with Krobatin's X. Army and try once more to envelop the Italian left wing. This move cut off the greater part of Tassoni's Carnia force, caught between Krauss and Krobatin.

Di Giorgio's force and the rest of the covering troops of the II. Army slowed down the enemy advance, holding for some time on the Livenza and the Monticano. The III. Army, to which the VI. Corps had now been attached, was coming back steadily, though Boroević's advance guards were giving little peace to its covering troops. Cadorna had intended to put the battered units of the II. Army in reserve at once, to be reorganized and refitted; but the delay in the retreat of the IV. Army made it necessary to keep the II. and XXIV. Corps as part of the river defence force, the II. Corps in line from the Vidor bridge to Norvesa, the XXIV. in reserve, both under the command of Di Robilant, to whom was to be entrusted the sector from the Montello to the Brenta. The converging retreat of the IV. Army was being carried out with much skill, and Di Robilant's troops succeeded in bringing away with them a great amount of material, but several detachments were cut off, including remnants of the Carnia force, which had been attached to the IV. Army for the latter part of the retreat.

By Nov. 8 the bulk of the IV. Army had succeeded in coming into line between the I. and the III., though part of the I. Corps was still on the road between Ponte delle Alpi and Feltre. On Nov. 9 and 10 the last covering troops of the II. and III. Armies crossed the Piave, from Pederobba to the sea.

The line chosen to defend the fortunes of Italy implied a withdrawal of the right wing of the I. Army. This contingency had been studied, and preparations for a new line had begun, during the Austrian offensive in 1916, and Cadorna had ordered the work to be continued during the interval. Pecori-Giraldi retired from Asiago and Gallio, and based his right on the fortified lines of the Meletta group. This formed a salient, for the line marked out for the IV. Army E. of the Brenta ran considerably farther south. Di Robilant had taken over the XVIII. Corps from Pecori-Giraldi, and it had been gradually withdrawn from its old positions to hold a line that ran from near San Marino in the Brenta gorge nearly due E. towards the Piave, keeping always in touch with the IX. Corps as the latter came down from Cadore. The IV. Army now held the line from the Brenta to the Piave, and the short stretch of the river as far as the Montello. The rest of the river line was held by the Duke of Aosta, with the VIII. Corps on the Montello, the II., which had been in line between Pederobba and the Montello, occupied in preparing defensive positions, going back to be rested and re-fitted with the rest of the II. Army.

Reserves were coming in fast from the depots, including the young class of 1899. French and British divisions were already in Italy, and others were on the way. Many units of the II. Army were being rapidly reorganized and were soon to come into line again. But for the moment the Italians had only the I., III. and IV. Armies to hold the new line; and the III. and IV. Armies had been sorely tried by the retreat. There had been a serious breakdown in the *moral* of a part of the II. Army, which had been largely responsible for the extent of the enemy's initial success, and the tremendous strain of the retreat had naturally been responsible for further breakdowns. The behaviour of the majority of the troops had been beyond all praise, but all were now worn-out, physically fatigued by the long trial of the retreat and suffering from the great moral depression caused by unexpected defeat and retirement from the lines they had held so long. Diaz, who took over the command from Cadorna on the morning of Nov. 9, had to face a situation that seemed almost desperate. The Italian armies had lost some 320,000 men in killed, wounded and missing, the number of prisoners being estimated at 265,000. The bulk of the II. Army had to be counted out altogether, and the total number of troops to be reorganized and re-fitted was over 300,000. More than 3,000 guns had been lost, and over 1,700 trench mortars. There was shortage in equipment of every kind. It seemed scarcely possible that these greatly weakened forces could resist the renewed attacks of the victorious armies which had followed so closely upon their heels. Fortunately, the plans for defence had been well and truly laid by Cadorna in the limited time that was available, and, still more fortunately, his foresight had caused elaborate preparations to be made on Monte Grappa. Roads had been built and gun positions prepared, and reservoirs made for water; trenches had been dug and strong redoubts constructed at various important points, though the defensive system was not completely finished when the enemy attacked at Caporetto. These works had been ordered with the double object of strengthening the defences of the Val Brenta against an attack from the N., and of providing against the possibility of a retreat to the Piave, which Cadorna had been compelled to consider once before, in May 1916. It was due to this forethought that resistance on the line now chosen was possible.

Diaz had little breathing-space, though some days were required before the enemy could prepare for an attack in force upon the new line. For Conrad saw a chance, and, though he was short of troops, he struck at once, while calling for reënforcements to be sent to him for the eastern armies. He attacked Pecori's troops on Nov. 10, as they were preparing to come back to the line already indicated. When they had taken up their positions in the Meletta-Badenecche salient, Conrad's attacks were renewed, and for 10 days the fight continued, but brought no success to the Austrians, who lost heavily. Conrad had brought to this sector of the front all the troops who had been in the Fassa Alps, but he still felt himself too weak for the end he had in view—a break-through to the plain, and he urged continually the dispatch of further reënforcements. Meanwhile Boroević had tested the river defences at various points. On Nov. 12 a crossing was effected at Zenson, some 17 m. from the mouth of the river, and a small bridgehead was established in the loop formed by the curving stream. Various other attacks at San Donà, Intestadura, and the Grave di Papadopoli were unsuccessful, and the troops at Zenson could make no headway. Down by the mouth of the river Hungarian troops succeeded in establishing themselves between the Old Piave and the main stream, but they were unable to gain any more ground. As the days went on, other attempts to cross the river were defeated by the III. Army, and on Nov. 16 an attack in force failed completely. The Austrians crossed at various points N. of Ponte di Piave, but were repulsed with heavy casualties, losing some 1,500 killed and nearly as many prisoners. After this

failure Boroević abandoned his attacks. The river was a serious obstacle; the Italian defence was sound; it was clear that prolonged and careful preparation was necessary.

Conrad and Boroević were making no headway, but a more dangerous attack was being conducted by Krauss, between the Brenta and the Piave. Krauss, who now had Krobatin's troops under his orders, and subsequently drew reënforcements from Stein's group, wished to organize a double drive through the Brenta and Piave gorges, and reach the plain by the tactics he had successfully employed in the Plezzo basin. Attempts to break through by the valley roads were quickly frustrated. Krauss blames his divisional commanders, who, he says, were opposed to these tactics, and could not make up their minds to a resolute attempt. An effort was finally made in the Quero gorge on Nov. 17 and failed badly. Nor were the numerous gallant attempts to capture the all-important ridge of Monte Tomba–Monfenera, which ran down from the Grappa *massif* to the Piave, more successful in breaking through the thin Italian lines. The struggle at this point lasted for five days, from Nov. 18 to 22, and the Italian IX. Corps, under Ruggeri Laderchi, fought a great fight. The critical day was Nov. 22. In the morning Krauss's troops, the Bosnians and the German Jäger, who had both been heavily punished already, made a great effort to break through. The attacking columns reached the crest of Monte Tomba, but their bolt was shot; and Monfenera still held firm and raked their left flank. The Italian position, however, was critical in the extreme, for the line had become very thin, and there were no reserves to speak of. At dusk a message came from Di Robilant that he was sending up a brigade of the VI. Corps, which had been drawn from the reserve of the III. Army. A later message promised another brigade. Ruggeri Laderchi took his courage in both hands, and, without waiting, counter-attacked with his own battle-worn troops. He drove the enemy off the ridge, except at one point where a gallant handful of men still clung to a knob of hill that had been made into a machine-gun redoubt. Next day the reserves arrived, and the line was firmly established. Only one more attack was made in this sector and both Jäger and Bosnian divisions had to be withdrawn and re-made.

When he failed in his first attempt to go through in the valleys, Krauss resigned himself to a frontal attack upon the mountain lines between the Brenta and the Piave. He claims justly that the conditions were very difficult, but he made a big effort. The attack with his centre and right began on Nov. 21, while he was still hammering against Monte Tomba with his left, and he gained ground to begin with, driving back the Italian outpost lines in the Grappa sector. For a week the attack lasted, but little progress was made. The 22nd Schützen and Edelweiss Divs. who had broken through at Plezzo, and the 94th, from Krobatin's army, gained a little ground on the right, the Alpine troops of the 22nd capturing the summit of Monte Pertica, but the German Alpenkorps and the Austrian 50th, which had passed to Krauss from Stein's group, to replace the battered Bosnian and Jäger divisions, made no headway against the salient of Solarolo and Spinoncia, or against the Tomba-Monfenera line. They succeeded in taking various positions, among them Spinoncia, but they could not hold them against the Italian counter-attacks, and further attempts to extend the success gained on the right were equally unsuccessful. On Nov. 26 the Edelweiss made a great attempt to capture Col della Berretta, but were repulsed, and a pause followed.

The breathing-space was needed by Di Robilant's troops, for the XVIII. and IX. Corps had been very highly tried, especially the latter. On Nov. 22 the situation in the Grappa sector had been improved by the arrival in line of the XXVII. Corps, already re-made, under the command of Di Giorgio; and the Corps distinguished itself greatly in the fighting which followed. But a new attack was preparing, when the situation was eased by the arrival in line of the British and French divisions which had hitherto been waiting in reserve. On Dec. 2 three British divisions under Lord Cavan took over the Montello sector, and a similar French force under Gen. Duchesne relieved Ruggeri Laderchi's IX. Corps in the Monte Tomba region. It was expected that both these points would be the object of early attack, but as it turned out they were both left unmolested. Conrad and Krauss continued their attempts to break through on the mountain front, but Krauss confined his efforts to the positions west of Monte Grappa and the worrying Solarolo salient. Boroević remained quiet on the Piave front, and the rest of Below's army was now practically a reservoir for Krauss, who drew divisions both from Scotti and from Hofacher, as well as from Stein. Krauss was finding the question of communications very difficult, especially for his artillery ammunition, and could not open his new attack till Dec. 10. On Dec. 3 Conrad, reënforced by fresh troops but still complaining that he was starved for means of attack, opened a heavy bombardment on the curve of the Italian front from Monte Sisemol to E. of Monte Badenecche. Next day, by a skilfully conducted attack following a liberal use of gas shells, he pinched up the Meletta–Badenecche salient, occupying both Tondarecar and Badenecche and taking Monte Fior and Castelgomberto in the rear. Next day Conrad's eastern columns pushed down quickly towards Foza, but were held by a rearguard of Bersaglieri and Alpini who fought off the attack until a new line was established farther S., covering Valstagna and the mouth of the Frenzela valley. But more than 11,000 prisoners were taken as a result of the gas bombardment and the breaking of the line at the base of the salient. It should be said that on this occasion as at Caporetto the Italian gas mask proved very unsatisfactory. The army was shortly afterwards equipped with the British mask.

The loss of the Meletta–Badenecche positions left another salient exposed to Austrian attack. The hills S. of the Valle dei Bonchi were now open to artillery fire and infantry attack on three sides, and, after a fortnight's preparation, on Dec. 23 Conrad launched a new attack on the Italian lines between Monte Sisemol and the Frenzela valley. The salient was quickly wiped out, several thousand prisoners were taken, and both Col del Rosso and Monte Melago were captured. Next day the Italians counter-attacked, and re-took Col del Rosso and Monte Melago. They established themselves firmly in their reserve lines, and repulsed another attack, the last, on Christmas Day.

Between Conrad's two efforts Krauss had made a determined attempt to drive the Italians off the Grappa line. His command was now increased to the strength of 10 divisions, six Austro-Hungarian and four German, and he did not spare his troops. He opened his attack on Dec. 11 by a push on each wing of his front, from the Brenta valley and Monte Pertica against Col della Berretta, and against both sides of the Solarolo salient. The attack from the N.E. was carried out by German troops, while W. of Solarolo and Col dell' Orso were picked Austro-Hungarian divisions. After the first day, when the Brandenburgers of the 5th Div. took Monte Spinoncia, the N.E. outwork of the salient, the Germans could make no more headway, in spite of repeated attacks, in which they were supported by the 94th Austrian Div. on the other side of the salient. Besides the 5th, the 200th and the Jäger also took part in the attack, which was renewed again and again during 10 days, but no further progress was made. Krauss, who reports that he was not allowed to have the German troops on the spot more than 48 hours before they were to attack, claims that this " excessive sparing " of the troops worked out badly, for they suffered from insufficient acquaintance with the terrain. However that may be, the German divisions, in spite of a great expenditure of shells, could gain no ground. Sometimes a position was gained for a few minutes, only to be lost again. The fighting was very stubborn.

Krauss had better success with his right wing. At the end of four days' hard fighting the Austrian 4th Div. had taken Col della Berretta and Col Caprile, though their occupation was not firmly established, and the Italians were continually counter-attacking. Four days more, and Krauss's men had captured Monte Asolone, which looks down the Valle di Santa Felicità to the longed-for haven of the plain. This was the term of the Austrian advance. On Dec. 20 the Italians counter-attacked, and won back a good deal of the lost ground, the last move in the

long struggle. Krauss accepted failure for the moment, hoping for an early spring offensive farther west. Five days later the snow came, the heavy winter fall that was at least a month late.

The Austrians and Germans were much favoured by the late coming of winter, which greatly prolonged the strain on the hard-tried armies of Italy. But it gave also to the defending troops the chance to re-make at once a shaken reputation.

The recovery of the Italian army on Monte Grappa and the Piave, after the initial failures and the heart-breaking experiences of the long retreat, was a remarkable feat of courage and will. It will be clear from the narrative here given that the Caporetto disaster was not due solely to the cause which was at first generally accepted as the explanation of a defeat so sudden and so overwhelming. Cadorna's *communiqué* of Oct. 28, which condemned in the strongest terms the behaviour of "detachments of the II. Army" and gave this as the cause of the enemy success, was too simple an explanation, and was, moreover, unwise. Inevitably, the impression was left that the failure in *moral* had been more widespread than was actually the case. For in the whole course of the war no such candid announcement had ever been made by any commander on either side; it was assumed, especially abroad, that if Cadorna confessed this much there was far more that he did not tell. Cadorna wished to arouse both army and country to a sense of the situation, and to indicate clearly the results of the peace propaganda against which he had protested. In Italy the result was good on the whole, for the country was stung to a great effort. But Cadorna's open condemnation of his soldiers was strongly resented in many quarters.

There is no question about the weak resistance of certain units in line, nor can it be denied that other troops, among the reserves, became temporarily infected with a spirit that led to what many observers likened to a strike. Extreme war-weariness and socialist propaganda had their offspring in these failures. But the failures were sporadic only. The stories current at the time and long after, of a preconcerted agreement for surrender to the enemy, have no foundation whatever. The defending troops were subjected to a very severe trial and some of them failed. Their failure led to disaster. How far might disaster have been lessened or averted if the preparations for the Austro-German attack, and the actual conduct of the defence, had been different?

The narrative has drawn attention to certain errors and misunderstandings which contributed to the enemy success. First among these, in order of time, was the difference of opinion between Cadorna and Capello as to the right course to pursue in face of the coming attack. It is difficult to avoid the impression that Capello was only half-hearted in adopting, and in directing his corps commanders to adopt, the line of action indicated by his chief. Whether Cadorna or Capello was right in idea is a question which will remain a subject of contention, though Cadorna's arguments seem almost unanswerable. The point is that Capello would seem to have interpreted Cadorna's instructions as to counter-offensive action in too liberal a fashion, influenced, perhaps unconsciously, by his own wish to attempt a big counter-stroke. The fact remains that the bulk of the II. Army was still aligned for an offensive, and though a complete modification was impossible, certain changes might have been made. The situation of the IV. Corps was especially unfavourable for defence, the front line positions of the 46th Div. being practically untenable. The Sleme-Mrzli position ought to have been abandoned for the Pleca Selisce line, which was as strong naturally as the other was weak. Despite the weakness of the Sleme-Mrzli line, both dominated and enfiladed, despite the practical certainty that it could not be maintained against a resolute offensive in force, the enemy attack found a large number of Italian guns, including many of medium calibre, stationed well in advance of the Pleca-Selisce line. Although various commanders had reported the Sleme-Mrzli line indefensible, steps which should have followed logically had not been taken.

It is obvious also—after the event—that if the reserves for the IV. Corps had been close at hand, on the Stol and higher up the Natisone valley, the inrush of the enemy might have been stemmed. Such dispositions were clearly desirable, even before the event. There was, in fact, a tendency to underestimate the amount of time necessary for the transference of troops from one position to another. On the other hand, Cavaciocchi did not make the best use of the reserves which he had. Cadorna's efforts had not succeeded in making all of his subordinates grasp the principles of defence in depth, or of "elastic" defence. It was only later that the theories upon which he had for long insisted were understood and applied. And it may be admitted that the tendency to push the infantry too far forward was a necessary consequence of the policy which had left the guns aligned as for an offensive. The failure to hold in strength the roads on both sides of the Isonzo has never been satisfactorily explained. All that can be said is that an attack along these roads was apparently unexpected; that it came; and that it had much to do with the disaster that followed. It is clear that there was insufficient collaboration between the commanders of the three corps occupying the front attacked. This was doubtless due to the extreme pressure of the days which preceded the offensive, and to the many modifications which had to be made during these days. But it remains a grave omission.

The failure of the Italian artillery to carry out the general order of counter-preparation expressly given by Cadorna, and repeated in no less categorical terms by Capello, had an undoubted effect upon the course of the battle. The attacking troops, both gunners and infantry, found their task unexpectedly lightened by the absence of a heavy return fire upon their batteries, trenches, and zones of concentration. The Italian infantry, waiting under a crushing bombardment, were puzzled and disheartened by the silence of their own guns. This holding of the Italian fire, like the failure to appreciate the necessity for defence in depth, is explained by the fact that as regards the practice of defensive tactics the Italians were some two years in arrears. Cadorna and a few others had realized the progress made in attack methods and the necessity of meeting them with new methods of defence. The realization had not spread downward. The Italian armies on the Julian front had been so busily occupied in attack that they had not worked out the application of new defensive methods. They had had no recent practice in meeting an attack on the grand scale. It was this lack of practice, no doubt, and a false confidence based on obsolete experience, which led to the belief that even if the opening phases of the battle were unfavourable to the defence, there would be ample time to restore the situation. This spirit was widely evident in the disposition of troops and guns.

When retreat became inevitable, the prospects might well have seemed desperate to those who had to organize it. For the army, long used to the war of positions that had been the rule for 28 months, was in no condition to move. The retreat, with all its confusion, its mistakes and its tragedies, remains an astonishing achievement. The resistance which followed it, when the retiring armies turned and stood at bay on the mountains and on the Piave, was the greatest of Italian victories. (W. K. McC.)

CAPPS, EDWARD (1866-), American classical scholar, was born at Jacksonville, Ill., Dec. 21 1866. He was educated at Illinois College (A.B. 1887) and Yale (Ph.D. 1891). In 1890 he was appointed tutor at Yale. In 1892 he joined the faculty of the newly-founded university of Chicago as professor of Greek language and literature, remaining such until 1907. In 1903 he was special lecturer at Harvard, and during the next two years studied at Athens and Halle. During 1906-7 he was managing editor of *Classical Philology*, in 1907 was elected president of the Classical Association of the Middle West and South, and the same year was called to Princeton as professor of classics. In 1914 he was elected president of the American Philological Association, and in 1917 was Turnbull lecturer on poetry at Johns Hopkins. In 1918 he was appointed head of the American Red Cross commission to Greece with the rank of colonel. In 1920 he was appointed minister to Greece, resigning in March 1921 and returning to Princeton. A leading authority on the Greek theatre, he contributed much to philological journals.

His works include *The Stage in the Greek Theatre* (1891); *From Homer to Theocritus* (1901); *The Introduction of Comedy into the*

City Dionysia: a Chronological Study in Greek Literary History (1903) and *Four Plays of Menander* (1910). He was editor-in-chief of the University of Chicago Decennial Publications, 29 volumes.

CARINTHIA (*see* 5.336), a territory of the Austrian Republic, is bounded N. by Styria and Salzburg, E. by Yugoslavia and Styria, S. by Italy and Yugoslavia and W. by Tirol.

Area and Population.—The total area of Carinthia before the World War was 4,005 sq. m., and the pop. (in 1910) 396,200 (99 per sq. mile). The terms of peace deprived Carinthia of Kanal-Thal together with Tarvis and the lead-mines of Raibl, which were given to Italy; the district of Seeland, S. of the Karawanken, abandoned by Austria; the valley of the Mies with the lead-mines of Mies and Schwarzenbach and the district surrounding the mouth of the Lavant, which was given to the Southern Slavs. The district of Tarvis had (1910) some 7,700 inhabitants, of whom 5,700 were Germans. The districts given to the Southern Slav state then had 17,500 inhabitants, of whom 3,200 were Germans.

It was arranged that the basin of Klagenfurt should decide its future allegiance by plebiscite. This plebiscite was taken in two distinct zones, the outer (Zone I. or A) of which reached nearly to Klagenfurt, the capital of the district, and comprised an area of 667 sq. m., with (1910) 72,138 inhabitants, of whom 31·5% were German; the inner (Zone II. or B) included a smaller portion of the district of Klagenfurt, and comprised an area of 132 sq. m., with (1910) 58,600 inhabitants, of whom 89·7% were German. The voting in Zone I. resulted, on Oct. 10 1920, in a choice of allegiance to Austria by 59·1% of the total votes; Zone II., therefore, went Austrian also.

In the Carinthia of to-day (apart from the two above-mentioned Zones) 94·8% were German in 1910. Most of the Slovene population is in Gail-Thal. As Zone I. was occupied by the Southern Slavs at the time of the Austrian census of 1920, the total number of the inhabitants of the Carinthia of to-day is unascertained. The portion under Austrian rule in 1920 (inclusive, therefore, of Zone II.) had 297,257 inhabitants (99 per sq. mile). In 1910 the pop. was 299,091; in Zone I. 72,138. Altogether, therefore, the present-day Carinthia had, on Dec. 31 1910, 371,229 inhabitants (101 per sq. mile). The population of the district which exercised the plebiscite was in 1910 93·3% Roman Catholic and 6·5% Evangelical. The proportion of males to females was as 1,000 to 992; in 1920, however, the proportion was as 1,000 to 1,067.

For administrative purposes Carinthia has been divided into seven districts and an autonomous city—the capital, Klagenfurt (pop. 26,111 in 1920). Other important places are Villach (pop. 21,896); St. Veit, until 1518 the capital of Carinthia (pop. 5,927); Wolfsberg (pop. 5,808); Spittal (pop. 4,406) and Bleiberg (pop. 2,861). In the Electoral Zone I. are Völkermarkt (pop. in 1910 2,631) and Oberferlach (pop. in 1910 3,104).

Agriculture.—Of the Carinthia of to-day (with the exception of the Electoral Zone I.) 8·69% of the soil was unproductive in 1900. Of the productive areas 15·6% consisted of arable, 0·4% gardens, 11% meadowland, 25·1% grazing land (mostly high-lying), 47·7% woodlands (mostly coniferous). Stock-raising is well developed, but suffered severely during the World War. In 1918 there were 164,309 head of cattle (of which 66,501 were milch cows) and 97,766 swine.

The Carinthian breeds of cattle (Lavanttaler and Mölltaler) and of horses are greatly prized. Bee culture, in conjunction with the cultivation of buckwheat, is actively pursued.

Minerals.—The mineral wealth is still noteworthy, notwithstanding the loss of important mining districts. The gold-mines of Tauern are not worked. Copper and antimony ores are being mined, but are not smelted locally. On the other hand, the output of lead (12,000 tons in 1915, or over 92% of the whole present output of Austria) and zinc (400 tons, or 54% of the whole output) ores is important in the Gail-Thaler Alps, especially in Bleiberg and Kreuth. Since the Raibl mines fell to Italy and those of Mies and Schwarzenbach to Yugoslavia, Bleiberg has regained its importance as the chief lead-mining centre in Austria. Consequently its products of lead and lead colours (white and red lead) are considerable.

The iron-mining industry, which was once widespread, is now active only at Hüttenberg, at the foot of the Saualpe. The ore raised (in 1915 98,000 tons, or 5% of the whole output of Austria) is carried away from Carinthia to be smelted elsewhere. Lignite (*Braunkohle*) is found in many parts of Carinthia, especially in Lavant-Thal; the output of this, however, was in 1915 only 84,000 tons, or 3% of the whole Austrian output.

Manufactures.—Carinthia is richly endowed with water-power; but, in spite of that, its industries are inconsiderable. The most important are the manufacture of scythes (Himmelberg), the ironworks of Ferlach and Feistritz, the small-arms factory at Ferlach, all kinds of lead-ware, some paper and some woollen factories (Viktring) and machinery (Brückl). Klagenfurt and Wolfsberg are busy centres of the weaving industries and also of the manufacture of and trade in articles in products of wood—notably cellulose, lignine and pasteboard.

Communications.—Since the opening of the Tauern and Karawanken lines, Villach has become an important railway centre, being at the intersection of the Salzburg-Trieste-Vienna-Venice and Marburg–Franzensfeste (Hungary-Tirol) railways.

CARLISLE, GEORGE JAMES HOWARD, 9TH EARL OF (1843–1911) (*see* 5.341), died in London April 16 1911. He was succeeded by his son, Charles James Stanley Howard (b. 1867), well known as a Unionist politician under the name of Visct. Morpeth. The 10th earl died Jan. 20 1912, and was succeeded by his son, George Josslyn L'Estrange Howard (b. 1895).

CARNEGIE, ANDREW (1837–1919), American "captain of industry" and philanthropist (*see* 5.364), died at Lenox, Mass., Aug. 11 1919. His ideals are shown by his benefactions and are best described by describing them. In 1910 he gave $10,000,000 for establishing an Endowment for International Peace, "to hasten the abolition of international war, the foulest blot upon our civilization." This Endowment was planned to encourage studies in economics, history and international law so that misunderstandings of peoples be averted by increasing their knowledge of one another. After America entered the World War (1917) the Endowment gathered much international information and furnished it for use at the Peace Conference. In 1910, the Pan-American Union building erected in Washington by Carnegie at a cost of $850,000 was dedicated. In 1911 he established his last and largest endowment, the Carnegie Corp. of New York, and before his death placed in its charge $125,000,000 to be used for promoting civilization in whatever way seems best to the trustees. The variety of its activities is illustrated by the following: American Red Cross ($1,500,000); Knights of Columbus War Work Fund ($250,000); Y.M.C.A. War Work Fund ($250,000); Y.W.C.A. War Work Fund ($100,000); Library Buildings in Army Cantonments ($320,000); Study of Methods of Americanization ($204,000); National Research Council ($5,420,000); Church Pension Fund (nearly $325,000), and Simplified Spelling Board ($110,000). In 1913 the Hague Peace Palace, given by Carnegie and costing $1,500,000, was dedicated. Some of the best known gifts in addition to the above mentioned are: The Carnegie Institute of Pittsburgh, nearly $20,000,000; the Carnegie Institution of Washington, $22,300,000; the Carnegie Hero Fund Commission, $10,500,000; the Carnegie Foundation for the Advancement of Teaching, $29,250,000; the Carnegie U.K. Trust, $10,000,000; the Scottish Universities Trust, $10,000,000; the Dunfermline Trust, $3,750,000; the Simplified Spelling Board, $250,000; the Church Peace Union, $2,025,000. By the close of 1918 he had erected 2,811 library buildings (1,946 U.S.A.; 660 Great Britain and Ireland; 156 Canada; 49 elsewhere) at a cost of more than $60,000,000. He had provided 7,689 church organs throughout the world, costing more than $6,000,000. To the Carnegie U.K. Trust, founded in 1913, he transferred the charge of all his existing and future benefactions other than university benefactions in the United Kingdom. He gave the trustees a wide discretion, and they have inaugurated a policy of financing rural library schemes rather than erecting library buildings, and of assisting the musical education of the people rather than granting organs to churches. In his will he provided that after certain enumerated bequests the residue of his estate (his family having already been provided for) should pass to the Carnegie Corporation. Appraisal of the estate, smaller than had been estimated, was made in 1921 and showed a net value of $22,880,000. Since according to the law of New York only half of an estate can be assigned as public bequests in case husband, wife, parent, or child survive, the residue passing to the Carnegie Corp. was less than $11,000,000. Before his death Carnegie had made public gifts, including those mentioned above, amounting to $350,000,000. If he did not die poor, as he claimed every man should, he at least had given away all but a relatively small portion of his wealth.

His *Autobiography* appeared in 1920.

CARNOCK, ARTHUR NICOLSON, 1ST BARON (1849–   ), British diplomatist, was born in London Sept. 19 1849, the son

of Admiral Sir Frederick William Erskine Hamilton Nicolson, 10th Bart. (1815–99). He was educated at Rugby and Brasenose College, Oxford, and in 1870 entered the Foreign Office, where he was for some time assistant private secretary to Lord Granville. In 1874 he was attached to the British Embassy in Berlin, and after occupying a succession of minor diplomatic posts became in 1885 *chargé d'affaires* at Teheran. From 1888 to 1893 he was consul-general at Budapest, in 1894 secretary of embassy at Constantinople, from 1894 to 1895 agent in Bulgaria, and from 1895 to 1904 minister in Morocco. In 1899 he succeeded his father as 11th baronet. In 1905 Sir Arthur Nicolson was sent as ambassador to Russia, where he remained until 1910, and in the latter year returned to the Foreign Office, being until 1916, when he retired, permanent Under-secretary for Foreign Affairs. He received the K.C.I.E. in 1888, the K.C.B. in 1901, the G.C.V.O. in 1905, and the G.C.M.G. in 1906. He was raised to the peerage on his retirement, and took the title of Baron Carnock. He published in 1873 a *History of the German Constitution.*

CAROLUS-DURAN [CHARLES AUGUSTE EMILE DURAND] (1837–1917), French painter (*see* 5.381*), died in Paris Feb. 18 1917.

CARPATHIANS, BATTLES OF THE, 1915.—In Jan. 1915 the E. flank of the continuous battle-front in the Carpathians lay around Baligrod. Farther to the E. as far as the Rumanian frontier, the Austro-Hungarian High Command had so far succeeded in preventing any Russian penetration into Hungary by means of measures improvised to meet the immediate perils such as the use of Landsturm and volunteers. All these means, however, no longer sufficed.

although the concealment of the concentration, which had to be carried out by means of a railway system of low efficiency, needed the utmost care and precaution. General Brussilov, at all events, spoke of the "whole position" being in jeopardy, in an order issued after the Austro-German offensive opened on Jan. 23.

West of the Czeremcha road 4 infantry and 2 cavalry divisions of the III. Austrian Army were to pin to their ground 5 Russian infantry and 1 cavalry divisions. On the E. flank Gen. von Boroević had 11 infantry and 2½ cavalry divisions[1] against 9 Russian infantry and 4 cavalry divisions; Gen. von Linsingen 6 infantry and 2 cavalry divisions[2] against one Russian infantry and 2 Cossack divisions, and Gen. von Pflanzer-Baltin 6 infantry and one cavalry divisions against 2 to 3 Russian infantry divisions Reichswehr and 2 Cossack divisions. The Russian effective strengths were certainly the greater, but the Central Powers hoped despite all difficulties to keep the attack going. They were undeceived; and the battle in the Carpathians actually dragged on for some three and a half months.

After the Austro-Germans had opened their operations with brilliant initial successes, the winter became, as it were, an ally of their adversaries, and so confined the scope of operations that the Russians succeeded in taking timely counter-measures. The temperature fell 13° F. below zero, and as the troops were operating almost entirely in the open, exposed to all the severity of the weather—and that without relief—sickness and frost-bite soon took a heavier toll even than battle casualties, and the divisions had too few men to fill their battle sectors, which in any case were very wide. In view of the extent of the area of attack, the divisions had, almost without exception, to attack in a single

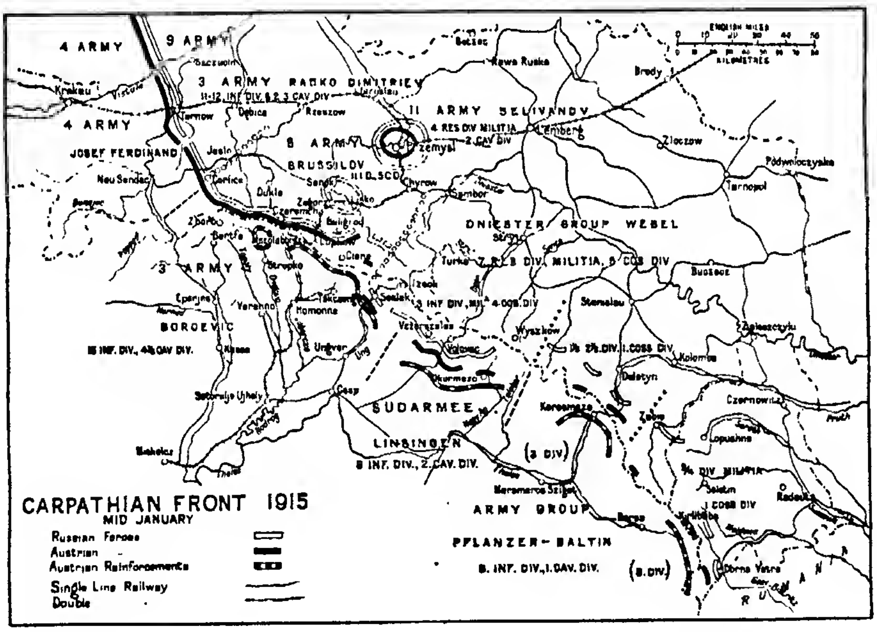

FIG. A.

The security of Hungary and the relief of Przemysl were to be effected by an attack on a broad front across the Carpathians, which, if successful, would develop into a flank attack on a large scale against the whole Russian battle-line. In this operation there were to take part: the army group of Gen. Freiherr von Pflanzer-Baltin, from the Rumanian frontier to E. of Wyszków; the German Southern Army, under Gen. von Linsingen (Austrian and German troops); thence to E. of the Uzsok pass; the reënforced right wing of the III. Army, under Gen. von Boroević, thence to the Czeremcha road.

Success depended largely on the vehemence of the blow and on the Russians being surprised. This surprise was in fact secured,

line. After the melting away of their offensive energy no reserves were left for the continuance of the advance; after every action the strength of the troops, tried as they were by adverse circumstances, grew weaker; by Jan. 27 the III. Army was no longer in a position to continue the offensive, and between Feb. 5 and 8 the Southern Army was in the same case. According to the unanimous conviction of both leaders and men the attack had literally "stuck fast in the snow," and thenceforward the battle became a defensive one. The Russians on the 26th had replied

[1] Ten infantry divisions, 2 infantry brigades, 2 cavalry divisions and one Landsturm Hussar brigade.

[2] Five infantry divisions, 2 infantry brigades, 2 cavalry divisions.

FIG. B.

by a counter-offensive W. of the Mezölaborcz railway, and from the 28th onwards this spread eastwards.

The Southern Army managed to hold its hard-won gains; the III. Army E. of Wola-Michowa still contrived to defend Hungary in Galicia behind the Upper San and on the hills N. and W. of Cisna; but the pressure of hostile masses (some 100,000 strong) astride the Mezölaborcz railway and in the Dukla valley forced it back towards the Hungarian plains to the line Wola-Michowa, Stropko, upper course of the Ondava.

The arrival on the 8th of the XVII. Corps from the IV. Army and the VIII. from the Serbian theatre brought some relief. The XVII. Corps came into line W. of the VII.; of the VIII., the one division (the 21st Landwehr) was sent to the X. Corps, the other (the 9th) to the XIX. and XVIII. Corps which were most in need of assistance. After the arrival of these fresh forces, Gen. von Boroević commenced on Feb. 10 an attempt to recover the lost ground at Mezölaborcz. This did not prosper, as the Russians here and in the Dukla valley, strongly reënforced, poured ever-fresh masses into the attack. The position of the III. Army grew daily more serious.

Meanwhile Gen. von Pflanzer-Baltin's army group succeeded, in a series of continuous actions from Jan. 31 to Feb. 20, in bearing its standards victoriously through the Bukovina and S.E. Galicia as far as Stanislau. Its Eastern group (three divisions) had liberated the Bukovina and then moved by way of Kolomea to the N.W. in order to join the Western group (three divisions) which had advanced along the Marmarossziget-Kolomea railway and north-westwards to Nadworna. The Russians, despite their violent counter-attacks, had by the 17th been defeated at Kolomea and their group, fighting stubbornly at Nadworna, was compelled by the increasing pressure on its flank to fall back towards Stanislau on the 19th. This town was occupied on the 20th by the main body of Pflanzer-Baltin's command, which had been reënforced on the 17th by two cavalry divisions; meanwhile the left wing on the Lomnica wheeled in towards Dolina in order from the rear to open up for the Southern Army the issue from the mountains. Already, however, the concentration N. and W. of Stanislau of powerful Russian forces—the leading troops of Lechitski's IX. Army—made it evident that the Russians were here preparing a counter-offensive. The well-developed railway system in Galicia facilitated the rapid reënforcement of the Russian eastern wing. With this the Austrian higher command was unable to compete successfully, for on the mountain railway by Marmarossziget only three divisions (5th from the I. Army, XI. Corps from the III. Army) could be brought up by the early days of March.

It was this circumstance, and the limited time during which the fortress of Przemysl could hold out, which had meanwhile determined the Austrian higher command, in spite of the experiences of winter in the Carpathians, to assemble behind the right wing of the III. Army the forces made available by the weakening of the Russian forces in Poland and the fortifying of positions there, although here none but a frontal attack was possible, and although to the Austrian higher command the offensive of the Pflanzer-Baltin army group seemed to promise the most decisive result. Since, however, a direct support of this group was impossible within the necessary time limit, the plan was to divert by a new attack over the Carpathians, such strong Russian forces as to enable the eastern wing to continue the offensive.

The Southern Army was reënforced by the German 4th Infantry Division. In order to build up the II. Army behind the right wing of the III., from Feb. 6 onward three divisions (27th Inf. Div. and IV. Corps—31st and 32d Inf. Div.) were withdrawn from Poland and the 41st and half the 38th Honved Divisions from West Galicia. On Feb. 15 Gen. von Böhm-Ermolli took over the command of these forces, together with the eastern half of the III. Army (Szurmay's group, consisting of the V., XVIII. and XIX. Corps) which numbered 60,700 rifles.

The left wing of the II. Army as now constituted was fighting with its last reserves of strength. The troops were exhausted almost to the point of collapse by continuous fighting and the severities of the weather. The Russian divisions, on the other hand, were in a better position in that they could usually allow two regiments to rest while two others attacked. It was only owing to the most strenuous exertions that the Austro-Hungarian troops succeeded, without reliefs, in holding the crests and preventing the successive waves of the Russian assault from sweeping away the thin line of defence. Again and again reserves drawn from the front itself came to the support of the points most in danger, a process which exhausted the strength of the

troops, who never had any rest, and led to a lamentable intermixture of the various units.

The commander of the II. Army, whose first care was the consolidation of his line by means of reserves, proposed to assemble his reënforcements secretly around Cisna, thence, in con-

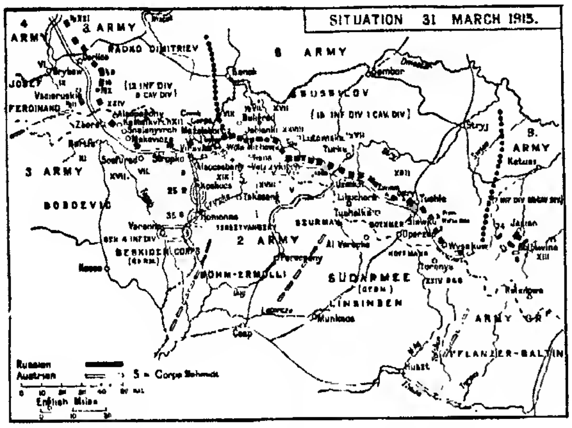

FIG. C.

junction with the III. Army's right wing to strike in the direction of Wola-Michowa, and immediately afterwards to deliver with his concentrated forces a crushing blow northwards from both sides of Baligrod. The attack on Wola-Michowa was intended to recapture Lupków station, the junction of a narrow-gauge railway running behind the front of the II. Army.[1] The recovery of this line would considerably facilitate the supplying of that army, the bulk of which was dependent on a single practicable road, of which the condition had alarmingly deteriorated owing to the unusually early thaw. Meanwhile it was no longer possible to ignore the urgent need of support for the W. wing of the army. On Feb. 16 the 16,000 men of the XIX. Corps on this flank were faced by 28,000 Russians, and a division had to be brought into line on the 20th, and another on the 23rd.[2] Not only was the opportunity of surprising the enemy lost, but they were allowed still further time to take counter-measures by the postponement of the Austrian attack on account of the condition of the roads.

The critical position of Przemysl and the continuing concentration of the IX. Russian Army facing the Austrian E. flank induced the Austrian high command to press for an immediate offensive. The Russians had also detached troops from the IX. Army (II. Cav. Corps and 11th Div.) to strengthen Lechitski's army, and the transference thither of other forces from the Nida front (XVII. Corps, 3rd and 35th Divs.) was also probable. In view of the disposition of the railways the only possible method of assisting Pflanzer-Baltin's army group was for the II. Army to attract to its own sector, by means of an early attack, as many hostile troops as possible. This course would considerably increase the difficulties of the II. Army, the special task of which was the relief of Przemysl; but its considerable numerical superiority over its enemies seemed to the Central Powers to afford a prospect of success. South of the Vistula there stood 30½ Russian divisions (exclusive of those investing Przemysl) as against 49 Austrian and German divisions; though many of the Austrian divisions had, it is true, been reduced to little more than the strength of infantry regiments. Every attempt was made to assemble superior forces in the decisive sector, from the Dukla pass to E. of Cisna. In the first few days of March, 17 divisions could be opposed to 7 or 8 Russian divisions, if the reënforcements sent to the II. Army were utilized on the W. wing. In addition, one division from the IV. and one from the I. Army[3] were used here, bringing up the total of fresh divisions to six and a half. The remainder were in many cases dead tired. Under these conditions the offensive of the III. Army which was ordered at the same time could hardly be very effective, and the main burden of the fighting fell to the II. Army.

Misfortune pursued it, however, from the first. The peril of Przemysl necessitated working to a time limit and in other ways exercised a powerful influence on decisions taken. The increasing difficulty in the matter of supplies led to the opening of the attack on Feb. 27, before the concentration was complete, and to the choice of the direction of Baligrod for the line of attack as being "the shortest road to Przemysl"; while the action planned against Lupków was in the end abandoned owing to the loss of time involved. The Russians, entrenched in their strong snow fortresses, were able continually to bring up reënforcements strong enough to deny to the group under Gen. von Terszstyánsky, advancing astride the Baligrod road, that decisive initial success which later experience in war has shown to be so important in attempts to break through the enemy's line.

Immediately after the opening of the offensive, the temperature sank once more to 13° F. below zero. The troops lost heavily from this cause and also from the methods of combat adopted; these latter were conditioned mainly by the necessity of bringing speedy help to the garrison of Przemysl, and the universal idea that this must be achieved at all costs led too often to massed infantry attacks against barbed wire without sufficient artillery preparation. A week had elapsed and no ground had been gained beyond the initial advance of 10 m. in depth astride the Baligrod road. On March 5 the High Command therefore ordered a general attack along the whole Carpathian front. The S. wing of the IV. Army[4] was to advance on the 6th by Gorlice in the direction Jaslo–Zmigrod. This had already been recognized by the Austrian higher command as the weakest spot in the Russian line, but even now it had not sufficient forces available to enable it to make full use of this knowledge. The attack was delayed till the 8th, and succeeded in pinning the Russian forces to their ground; parts of von Woyrsch's army detachment and the IX. German Army attacked N. of the Vistula with the same object between March 6 and 9.

During the next few days the III. and Southern Armies carried out no important operations. The II. Army attacked with all its forces along the whole of its front, between March 5 and 10. In spite of this the Russians, by the 10th, had succeeded in bringing into action forces equal to those of their assailants; they were able—with the advantage of strong mountain positions—to oppose to the 112,000 rifles of the II. Army about the same number. On the decisive W. wing they had from 21,000 to 28,000 fresh rifles in reserve as against 13,000 fresh Austrian rifles.[5] This was decisive, for the II. Army was by now

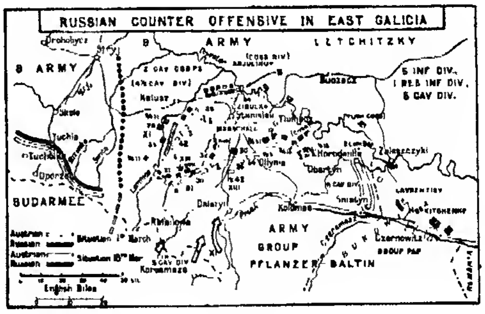

FIG. D.

completely exhausted. Its losses between March 1 and 15 amounted to 51,000 men (over a third of its total strength on March 1).[6] Two-thirds of these casualties—855 officers and

37,205 other ranks[1]—had been suffered by Terzstyánsky's group, only some 70,000 strong.

The offensive of the II. Army culminated on March 10. The Russian counter-offensive,[2] commencing on the 11th with a flank attack by Wola-Michowa, checked the attack astride the Baligrod road, and on the 14th it had to be abandoned as hopeless.

The offensive wedge of the II. Army had acted as a magnet to some 5½ Russian divisions. Among these were the 35th and 3rd Divs. so that the object of relieving the pressure on Pflanzer-Baltin's front had been achieved.

General Lechitski had commenced his offensive against this group with four corps on Feb. 28, and the Austrian right wing, outnumbered, had fallen back, fighting stubbornly, to N. of Obertyn. Thanks to the timely arrival on March 4 of the XI. Corps from the IV. Army, Pflanzer-Baltin's troops succeeded in holding their new front, although the Russians had by the 10th advanced in N. Bukovina as far as the Pruth. On March 18 their offensive against the Austrian E. wing came to a standstill.

The relief of Przemysl had thus proved impossible. However, in order to assist the garrison in its attempt to cut its way out, by holding fast as many Russian troops as possible, a striking force was assembled, despite all obstacles, on the E. wing of the II. Army. There could be however no question of coöperating with the garrison, as the *sortie* attempted on the 19th broke down while still within the fortress area, all stocks of food being exhausted; a capitulation was signed on the 22nd after all war material had been as far as possible destroyed.

The failure of the attempts to relieve Przemysl much discouraged the Austrian troops, particularly those of the II. Army. Their endurance and self-sacrifice, however, were not entirely in vain. The attention of the Grand Duke Nicholas had been so riveted on the danger threatening him to the S. of Przemysl that he lost sight of the duty of coöperating with the Western Allies of Russia, and decided to attempt a break-through into Hungary with the forces now assembled to the S. of Przemysl. This was quite in accordance with the wishes of the Austrian and German high commands, which up to that time had sought to defend Germany by continuous attacks in the Carpathians. The strong Russian forces now directed against Hungary were being enticed into a region where in winter, as had recently been proved, full advantage could not be taken of superiority of numbers, a superiority easier in the circumstances to destroy than to maintain.

The last great attempt of the Russians to break through began on March 20 with an onslaught of unexampled violence against the whole front of the III. Army, which, despite all it could do, was gradually forced farther back in the direction of Hungary. Units of the IV. Army[3] arriving on the 28th to reënforce the left wing brought the attackers to a stand; but against the centre and right of the army the Russians continued their attacks with ever-fresh forces, and it was obvious that their object was to break through towards Varanno and Homonna, the most northerly points of the Hungarian plain. This caused the utmost anxiety to the II. Army command. As early as the 23rd a gap existed between the left flank of that army and the retreating right of the III., and although, itself heavily pressed, the II. Army had no option but to put in some march battalions[4] to fill it. Again on the 26th, at a time when its own front was weakening rapidly, the army dispatched a combined brigade[5] from its W. wing, and one infantry[6] and one cavalry brigade[7] from its E. wing to the III. Army. (The infantry were sent back later.) Any further successes against the right of the III. Army must have seriously menaced the position of the II. Army stationed N. of the frontier ridge. On the 27th, accordingly, the army command proposed a voluntary withdrawal; but the high command, which throughout these days of dire peril still held firmly to its offensive projects, refused its assent, as the blocking of the Laborcz valley by the German Beskiden Corps[8] (4th German Div. of the Southern Army, 25th Res. Div. of the IX. Army, 35th Res. Div. of Woyrsch's group) had been begun.

Meantime, however, the Russians at the end of March had driven the II. Army to retreat. The system of constantly patching the front with troops withdrawn from other sectors was no longer possible, in view of the fact that the enemy's attacks were now simultaneous all along the army line. The lack of good roads prevented these reserves arriving in time or in sufficient numbers to gain isolated successes. The Russians, being superior in numbers, were able to seize the opportunity afforded by the withdrawal of reserves from the centre of the II. Army at Cisna to drive in its front in that sector. Here they seriously menaced

the single practicable road, by which alone a deliberate withdrawal could be carried out by the Austrians. The situation being now critical, the II Army command on April 1 gave the order for a retreat. The sorely tried II Army had to fall back in one bound between April 2 and 4 to the line Pataknfalu-Nagypolany-N. of Virava, to the S. of the Carpathian ridge; only Szurmay's group, detached to the Southern Army, was to hold the Uzsok pass on the crest itself.

The effect of this surrender of the main ridge was not only to shorten the Austrian front, but also to utilize the mountains, hitherto an impediment to their operations, as an obstacle against the Russians and improve the internal situation of the II. Army (practicable roads and billeting facilities right up close behind the front). The Russians did not molest the withdrawal; indeed when it began they were endeavouring with the forces set free by the fall of Przemysl to break through in the Laborcza valley. The attack fell on the battered X. Corps, which was slowly pressed back; the gate of Hungary seemed on the point of being forced. Fortunately for the Central Powers, the German Beskiden Corps arrived just at the right moment to close it again in concert with the X. Corps, in the "Easter battle" (March 2 to 5). While the II. Army was falling back over the frontier ridge on the 3rd, the pressure in the Laborcza valley was checked; on the 4th the Russians lost ground, and by the 5th the situation had been restored.

The Grand Duke now extended his attack on both flanks, but in vain. The III. Army repulsed all the mass attacks of the enemy, and by April 9 the great battle on its front, which had continued without interruption since March 20, came to an end. On the II. Army front the Russians suffered considerably from cold and hardship in the inhospitable mountain country and were compelled to halt to reorganize their lines of communication, so that they could only follow up the II. Army slowly, and had to leave much of their artillery behind. The II. Army was therefore allowed time to dig itself in and bring up enough troops to hold its chosen line of resistance. Better weather (sunny days, and night temperatures of only 23° F.) did much to improve the condition of the troops.

As the roads became better, the main weight of the Russian attack was transferred to the left wing (astride the Telepócz road near that place). This, the last serious offensive against the II. Army front, was finally repulsed on the 13th after a fresh division[1] from the IV. Army had been put into line. Despite the most desperate efforts, the Russians failed during the following days to secure any further success. Their last gain of ground was the capture of the hotly contested height of Kozialata on the 17th; a series of unsuccessful Austrian counter-strokes prolonged the fighting till the 20th, when the consolidation of the opposing fronts and the mutual exhaustion of the combatants ended it.

Only on the E. wing of the army, which had coöperated with Szurmay's hard-pressed troops of the Southern Army at the beginning of April in the defence of the Uzsok pass, was there still considerable activity. The Russians repeatedly assailed the pass and the Upper Ung valley from N.W., N. and N.E., between April 21 and 26, but were held off by the united efforts of Szurmay's group and the E. wing of the II. Army. The railway, which had only been repaired after great difficulty, remained available for use during the spring offensive.

Elsewhere the Southern Army front remained on the whole unchanged. After some weeks of sapping the hotly contested Zwinin ridge was stormed on the 9th, and the Ostry on the 25th by the Stryj detachment (detached E. wing of Brussilov's army, 4th Div.). Pflanzer-Baltin's group, reënforced in March by three cavalry divisions, also held its old positions in Galicia; it had once more driven the Russians from the northern Bukovina although the IX. Army in its front had been increased to 8 infantry and 9½ cavalry divisions, and 7 reserve brigades.

The character of the battle in the Carpathians, which stemmed the Russian advance southwards, is shown by the figures given in tabular form in the following statement, which was issued by the Austrian high command on April 20.

[1] The 51st Honved Div.

Army.	Frontage	Rifle Strength (incl. cavalry).

Total	720 miles	1,001,000	against	1,540,000	Russians

The positive objective twice attempted by the Central Powers, the relief of Przemysl, was not achieved. Their negative aims were, however, successfully accomplished; the Russians were prevented from attacking Germany, and their attempted invasion of Hungary was also frustrated. Finally the gradual melting away of the best elements of the old Imperial Russian Army was one prominent cause of the great successes of the Central Powers during the spring offensive. (K. M.)

CARPENTER, WILLIAM BOYD (1841–1918), English divine, was born at Liverpool March 26 1841, the son of the Rev. Henry Carpenter, incumbent of St. Michael's, Liverpool. He was educated at the Royal Institution school, Liverpool, and at St. Catherine's College, Cambridge, where he graduated in 1864, being ordained the same year. He earned a great reputation as an eloquent preacher, and in 1882 became a canon residentiary of Windsor, two years later being made bishop of Ripon. He resigned his see in 1911, and was made canon and later sub-dean of Westminster. He died in London Oct. 26 1918.

CARR, JOSEPH WILLIAM COMYNS (1849–1916), English art critic and dramatist, was born in London March 1 1840, his father being a member of an old Cumberland yeoman family. Educated at the university of London, he was called to the bar in 1869, but soon became a writer of art criticism for the *Pall Mall Gazette* and, after 1875, editor of *L'Art*. He also founded and edited the *English Illustrated Magazine*, and was associated with Charles Hallé in the founding of the New Gallery, an offshoot from the Grosvenor Gallery, in 1888. In his later years he engaged in theatrical enterprises, and he was the adapter, alone or in collaboration, of a good many plays, notably Hardy's *Far from the Madding Crowd* (1882) and the version of *King Arthur* produced by Sir Henry Irving at the Lyceum theatre in 1895. He published *Some Eminent Victorians* (1908) and *Coasting Bohemia* (1914), both containing reminiscences of his own early life and the people he had known. He died in London Dec. 12 1916.

See *J. Comyns Carr: Stray Memories*, by his wife (1920).

CARRANZA, VENUSTIANO (1859–1920), Mexican revolutionary and president, was born Dec. 29 1859, at Cuatro Cienegas, Coahuila. He was educated in the Ateneo Fuentes at Saltillo and in the Escuela Nacional Preparatoria at Mexico City. Defective eyesight prevented a legal career for which he had studied. Entering politics, he became *presidente municipal* of Cuatro Cienegas in 1887. In 1893 he and his brother Emilio led a revolt against the repeated candidacy of García Galán for the state governorship, and they succeeded in inducing President Diaz to name General Muzquiz as governor. Carranza was first elected senator *suplente* (alternate) for Coahuila for 1900–2. On the death of the proprietary Ortiz de Montellanos, he took his seat April 5 1901. He was elected proprietary senator for 1904–8, and again for 1908–12, but served only until Dec. 15 1910. In the position of senator he was amenable to the control of Diaz. In 1909 he became candidate for the state governorship in opposition to the wishes of the central Government. In the following year he joined the Madero revolution, serving as a member of the Junta Revolucionaria at San Antonio, Texas. Madero made

[2] Infantry divisions reckoned as being 14,000 rifles, cavalry divisions as 2,000 sabres.

[3] Including Austrian reënforcements arrived since April 15.

him chief of the military division of Coahuila, Nuevo Léon, and Tamaulipas and later Minister of War in his provisional Cabinet. In this position he organized Madero's army. After the triumph of the revolution he returned to Coahuila and assumed the governorship, to which he was regularly elected in May 1911. After the *coup* of General Huerta, Feb. 18 1913, and the murder of Madero, to whom he was attached, Carranza issued the Plan de Guadalupe in March, disavowing Huerta as president. He then became First Chief of the Constitutionalist army and personally visited all northern Mexico to organize the opposition, establishing his government at Hermosillo, Sonora, whence he moved southward until he entered Mexico City Aug. 20 1914, after Huerta had fled. He was opposed by Francisco Villa and Emiliano Zapata after the split of the Constitutionalists, and withdrew to Vera Cruz, which he occupied when the American occupation terminated. On Oct. 9 1915, he was recognized as head of the *de facto* Government by the United States and seven Pan-American powers. On Sept. 30 1916 he decreed the abolition of the vice-presidency and the limitation of the presidential term to four years instead of six. He was elected to the presidency March 11 1917, under the constitution promulgated under his sanction on Feb. 5. Under this radical body of fundamental law he issued a series of decrees for the nationalization of petroleum lands, which kept his Government continually in strained relations with England, France and the United States. As the time approached in 1920 for the election of his successor, he attempted to force the election of Ignacio Bonillas, a civilian candidate. This led to an attempt to control the state government of Sonora, a stronghold of Alvaro Obregon, who was the strongest and most popular aspirant for the presidency, but who was inimical to Carranza's politics. The state revolted in March 1920, being immediately followed by the country at large. Carranza attempted to move his Government to Vera Cruz on May 7. His flight was interrupted and he himself was killed as he was fleeing the country, on the night of May 18, at Tlaxcalantongo, Puebla.

CARREL, ALEXIS (1873–), Franco-American surgeon, was born at Sainte-Foy-les-Lyon, France, June 28 1873. He graduated at the university of Lyons (L.B., 1890; Sc.B., 1891; M.D., 1900), and for two years was *prosecteur à la faculté de médecine* at that university. In 1909 he became a member of the Rockefeller Institute for Medical Research in New York. There he won world-wide fame by his experiments in transplanting human organs. In 1912 he read before the American Medical Association a paper on *Preservation of Tissues and its Application to Surgery*. The possibility of keeping alive tissues removed from the organism led to his seeking practical means of preserving them for surgical use. He was awarded a Nobel prize in 1912 for his contributions to surgical knowledge. On the outbreak of the World War he returned to France and devised the Carrel-Dakin treatment of wounds. Using H. D. Dakin's preparation, a neutral solution of hypochlorite of sodium, Carrel's apparatus keeps the wound continually moist. Countless amputations were avoided, healing was rapid, and scars supple. In 1919 he resumed his work at the Rockefeller Institute.

CARSON, EDWARD HENRY CARSON, Baron (1854–), British statesman and lawyer, son of Edward Henry Carson, C.E., Dublin, was born Feb. 9 1854 and educated at Portarlington school and afterwards at Trinity College, Dublin. He was called to the Irish bar, and made his reputation as Crown Prosecutor in Dublin in the difficult years when Mr. Balfour was Chief Secretary for Ireland. His pluck, readiness, wit, and skill in cross-examination soon brought him to the front both in legal and in political circles. He became a Q.C. at the Irish bar in 1889; but his ambitions could not be satisfied with legal eminence in Dublin. He was called to the English bar, and took silk there in 1894. Meanwhile he had been returned to Parliament in 1892 in the Unionist interest as member for his own university of Dublin and was for a few months Solicitor-General for Ireland. He entered Parliament just when Gladstone was about to make a second effort to pass a Home Rule bill, and he helped the Unionist leaders to defeat the measure. But during the next 20 years he was mainly occupied with his professional work. Having risen to a leading place at the bar in Ireland, he achieved an even more striking success at the English bar; and in 1900 he was appointed Solicitor-General, a post which he held until the change of government in 1905–6. In the early years of the new century he gradually came to be regarded as the spokesman in the House of Commons of the Irish Unionists, and in that capacity welcomed Mr. Birrell's University bill of 1908.

It was not until 1911, when another Home Rule bill was imminent, that Sir Edward Carson emerged as a political figure of first-class importance. He bitterly resisted the Parliament bill, which was to curtail the power of the Lords and enable a measure of Home Rule to be passed over their heads and without a direct appeal to the people. He was one of the "Die-hards" who urged the peers to take the responsibility of throwing out the bill in spite of the ministerial threat to swamp their House with sufficient new creations to make its passage secure. He told the House of Commons that the passing of Home Rule by force would be resisted by force and that the resisters would be constitutionally right. Feeling against the bill was most bitter in Ulster, which, Protestant and loyal, would be placed by it at the mercy of the Roman Catholic and largely disloyal majority of the other three provinces. He went to Ulster in the autumn, and at an enormous Unionist demonstration at Craigavon, near Belfast, endorsed the threats of rebellion against Home Rule which previous speakers made. Belfast, he said, was the key of the situation; Ulster would never submit to a Parliament in Dublin. They must be prepared, if necessary, to take over the administration of those districts which they were entitled to control. Practical measures were immediately undertaken in this direction, though Liberals and Nationalists scoffed. His position was that he and his Ulster friends were loyal to the constitution as it existed; they were only rebels, he said, in the sense that they desired to remain under the King and the imperial Parliament. In anticipation of the introduction of the Home Rule bill in the spring of 1912, he presided over a gigantic gathering in Belfast in Easter week, which Mr. Bonar Law, the newly appointed Unionist leader, came to address; and he made those present repeat after him, "We will never, in any circumstances, submit to Home Rule." He himself, in a speech instinct with passion, moved the rejection of the bill on its introduction, and took a leading part in opposition during its subsequent stages. But his activity was mainly outside. He made frequent speeches in the next couple of years in different parts of England and Scotland, particularly at a great demonstration at Blenheim in July 1912, at which Mr. Bonar Law pledged the support of the Unionist party to Ulster. But his principal work was in the organization of resistance in Ulster itself, including the formation of a local volunteer force, which speedily assumed large proportions. In Sept. 1912 he was the chief figure at a series of demonstrations in all parts of the province, culminating in an enormous assemblage at Belfast on Sept. 28. There he took the lead in signing a solemn covenant by which the men of Ulster bound themselves to stand by one another in defending their position of equal citizenship in the United Kingdom, and in using all necessary means to defeat the conspiracy to set up Home Rule, and further pledged themselves to refuse to recognize a Home Rule parliament. He followed this up by moving unsuccessfully in Parliament on New Year's day 1913, to exclude Ulster from the operation of the bill. In the autumn of 1913 the Ulster Unionist Council organized itself, under his supervision, into a provisional Government, of which he was the leading member, and a guarantee fund of £1,000,000 was initiated to which he himself contributed £10,000. He reviewed the volunteers, who were rapidly becoming a formidable military force approaching in number 100,000 men. But when ministers, who had refused to prosecute him or interfere with his activities, began to realize the determination of the six north-eastern Protestant counties, he did not repulse their overtures for a settlement by consent, but said that it must not establish a basis for separation. His advice during the following winter to his Ulster friends was "peace but preparation." He entirely declined to accept Mr. Asquith's offer, in the spring

of 1914, of a county option of exclusion for six years. That was "sentence of death with a stay of execution." If that was the Prime Minister's last word, his place was in Belfast; and he and several of his fellow Unionist members from north-east Ireland made a dramatic exit from the House on March 19 to go to Ulster. When he returned for the debates on the Curragh incident he told the House that there was only one policy possible, "Leave Ulster out until you have won her consent to come in." He became a member of the abortive Buckingham Palace Conference convened by the King in the hope of compromise; and when that broke down in the end of July it looked as if he and his Ulster friends would have to make good in action their policy of force.

The World War supervened, and switched off his activity into another direction. Though he resented, as a breach of the political truce between parties, Mr. Asquith's determination to pass the Home Rule bill into law while suspending its operation and promising some form of special treatment for Ulster, he went to Belfast in order to stimulate Ulstermen and especially Ulster volunteers to join the British army, and had a considerable success. He was eager for a thorough prosecution of the war, and accordingly joined Mr. Asquith's Coalition Ministry of June 1915 as Attorney-General, resigning however in Oct. because he thought that the policy of the Cabinet, after the defection of Greece, involved the desertion of Serbia, a small country in whose fate he took a profound interest. He was strongly in favour of the Compulsory Service bill in 1916, and regretted that Mr. Redmond should insist on excepting Ireland from its provisions. He looked favourably upon Mr. Lloyd George's efforts that summer to arrange an agreed settlement of the Irish question, and when that statesman formed a new government in Dec. for the more efficient conduct of the war, joined his Cabinet as First Lord of the Admiralty. The great anxiety of the Board of Admiralty at this period was how to counter the German submarine attack which was steadily increasing in intensity. He placed his reliance mainly on an Anti-Submarine Department which had been established in Whitehall, consisting of the most experienced men serving at sea, and on the Board of Inventions, under Lord Fisher, with whom were associated some of the greatest men of science in the country. His shipbuilding programme was largely one for making good losses in the mercantile marine. The losses however continued to increase, and led to a reorganization of the Admiralty, with a view to strengthening the navy war staff as well as to put the supply on a sounder basis by revising the office of Admiralty Controller. Outside his departmental duties Sir E. Carson warmly promoted the Irish Convention which the Government assembled this year. In July he quitted the Admiralty to become a member of the War Cabinet without portfolio, a position which he resigned at the beginning of 1918. But, in or out of the office, his activity was directed wholeheartedly to the vigorous prosecution of hostilities.

After the war was over, Ulster and Ireland regained the first place in his thoughts. At the general election of 1918 he left Dublin University, in order to represent one of the divisions of Ulster's capital, Belfast. On the anniversary in July 1919 of the battle of the Boyne, he restated, speaking near Belfast, Ulster's position and claims, demanded the repeal of the Home Rule Act, threatened to call out the volunteers if any attempt were made to change Ulster's status, declared Dominion Home Rule to be merely a blind for an Irish Republic, and criticized Sir Horace Plunkett as one who was distrusted by both sides. When, however, Mr. Lloyd George proposed in the winter his bill for the reform of the government of Ireland, establishing parliaments and executives both in Dublin and in Belfast, and a Federal Council for all Ireland, he moderated his attitude. Though he would have preferred that Ulster should remain in the United Kingdom, yet, as this bill gave her a parliament of her own, he would not oppose it. When the bill left the Commons in Nov. 1920, he said that, though Ulster did not ask for a parliament, she would do her best to make the arrangement a success. He exerted himself to that end in Ireland, with the result that the Unionists succeeded even beyond their hopes in the elections in May 1921 for the first Ulster Parliament, and so started with an overwhelming majority. But he declined to sit in the new parliament himself; and he also resisted the suggestions that he, as the most outstanding fighter in the Unionist party, should be put forward to succeed Mr. Bonar Law as leader in the British House of Commons. He had done his best to save Protestant Ulster from domination by the Roman Catholic majority of the south and west. He was 67 and had felt the strain of the last 10 years; so he quitted active politics, and accepted a lordship of Appeal and a life peerage as Baron Carson of Duncairn.

He was twice married—in 1879 to Sarah A. F. Kirwan, who died in 1913, leaving two sons and a daughter; and in 1914 to Ruby Frewen, by whom he had one son. (G. E. B.)

CARTWRIGHT, SIR RICHARD JOHN (1835–1912), Canadian statesman (*see* 5.435), died at Kingston, Ont., Sept. 23 1912.

CARUSO, ENRICO (1873–1921), operatic tenor, was born in Naples, Feb. 25 1873. He was early apprenticed to a mechanical engineer. He began to sing in the choirs at Naples when he was 11, and later studied for three years under Guglielmo Vergine. He made his début in 1894 in *L'Amico Francesco* at the Teatro Nuovo, Naples. He first won marked success as Marcello in *La Bohème*, at Milan, in 1898; and at La Scala theatre in that city, he sang for the next four years. From 1899 to 1903 he was at St. Petersburg in the winter, and in the summer at Buenos Aires. But meanwhile he appeared also in many cities, including Moscow, Warsaw, Rome, Paris and London (Covent Garden 1902), everywhere being warmly greeted. In America he first appeared in 1903 at the Metropolitan Opera House, New York, where for 18 years he was the leading tenor. He made an extensive concert tour through the United States in 1917. He had a very extensive Italian and French repertory, but never essayed Wagnerian rôles. He won special success in *Aïda*, *Carmen*, *Huguenots*, *L'Elisir d'Amore*, *Pagliacci*, *Rigoletto* and *Samson*. He died Aug. 2 1921 at Naples.

CARY, ANNIE LOUISE (1842–1921), American singer (*see* 5.438), died April 3 1921 at Norwalk, Conn.

CASEMENT, ROGER DAVID (1864–1916), British consular official and Irish traitor, was born near Dublin Sept. 1 1864. His family were Protestants who migrated to Ulster from the Isle of Man early in the 18th century, and he was brought up in the Protestant faith. Early in his career he was in the service of the Niger Coast Protectorate, afterwards entering the British consular service, and being appointed to Lorenzo Marques (1895), Loanda (1898) and to the Congo Free State (1898). After seven years on the Congo he was transferred to South America, going to Santos (1906), to Pará (1907) and to Rio de Janeiro as consul general (1908). In 1910, charges of cruelty having been brought against the agents of the Anglo-Peruvian Amazon Co., operating in the region of the Putumayo, a tributary of the Upper Amazon, Casement was commissioned by the British Government to inquire into these charges on the spot. The result of his investigations was published as a Blue Book in 1912, and public opinion was deeply shocked by the evidence it contained of the appalling atrocities committed on the natives employed in collecting rubber (*see* PUTUMAYO). For this service he was knighted. His mind, however, seems to have become affected as the result of his experiences in the tropics, and on his return to Ireland from South America he developed a fanatical hatred of England, throwing himself with ardour into the movement for Irish independence.

As early as Jan. 1913 *Irish Freedom*, a Sinn Fein monthly review, had foretold the coming war with Germany and proclaimed this as "Ireland's opportunity," and to the July number of this review Casement, under the pseudonym of San Van Vocht, contributed an article on "Germany, Ireland, and the next War," in which he elaborated this theme. From the first he took an active part in the Volunteer movement in the south, and when, in the spring of 1914, the bulk of the Volunteers ranged themselves under Mr. Redmond's leadership (National Volunteers) he attached himself to the Sinn Fein section, which refused all compromise (Irish Volunteers). He had in the previous year made efforts, in concert with Mrs. J. R. Green and Capt. White,

to organize in the north counter-demonstrations of Protestants against the Ulster movement which culminated in the swearing of the Covenant; but these efforts were a complete failure.

After the outbreak of the World War Casement went to the United States, whence he wrote in Oct. urging Irishmen to stop in Ireland, "as they have no quarrel with Germany." In Nov. he went to Berlin and a *communiqué* from the German Foreign Office, published in the official *North-German Gazette*, stated that he had been given assurances there with regard to Ireland in the event of a successful German invasion of Great Britain. A pamphlet by him, entitled *The Crime against Ireland and how the War may right it*, appealing for a German-American-Irish alliance, was disseminated in the United States as part of the German propaganda. In Feb. 1915 he wrote an "open letter" to Sir Edward Grey accusing the British Government of conspiring against his life. During that year he visited the prison camps in Germany and tried, with very poor success, to undermine the loyalty of Irish soldiers who were prisoners of war, making them alluring promises if they would join an Irish brigade to fight for Ireland against Great Britain. He succeeded in keeping in touch with the extreme elements in Ireland and in arranging with them the rebellion planned for Easter week 1916, of which he himself proposed to take the lead. On April 12 he sailed for Ireland in a German submarine, which was accompanied by a vessel, laden with arms and ammunition, and purporting to be the Norwegian s.s. "Auk." They reached the coast of Kerry on the 21st; but the Government was forewarned. The "Auk" was captured by a British patrol boat and sunk by her own crew while being taken to Queenstown. Casement, who with two companions had landed in a collapsible boat at Banna, was arrested on the 24th in a ruined fort which afterwards became a place of pilgrimage for Sinn Fein Irishmen. He had meanwhile succeeded in sending a message to Dublin, announcing the capture of the "Auk" and advising the postponement of the enterprise. This action, which really broke the back of the rebellion, was bitterly denounced by some of his fellow conspirators, who even ascribed their misfortunes to his insane belief in his own superhuman powers.

Immediately after his arrest Casement was taken to London, and on May 15 was charged at Bow Street police court with high treason, and committed for trial. The trial began on June 26 before the Lord Chief Justice and two other judges. On June 29 he was convicted and sentenced to death, and on the following day was degraded from his knighthood. The Court of Criminal Appeal dismissed his appeal against conviction on July 18, and he was executed in Pentonville prison on Aug. 3, having been received into the Roman Catholic Church just before his death.

See L. G. Redmond Howard, *Sir Roger Casement: a Character Sketch without Prejudice* (1916). Also a sketch by McQuilland in *Sunday Herald* (April 30 1916), and the White Paper issued by the British Government, *Documents relating to the Sinn Fein Movement* (Cmd. 1108).

CASHIN, SIR MICHAEL PATRICK (1864–), Newfoundland politician, was born at Cape Broyle, Newfoundland, Sept. 29 1864. He was educated at St. Bonaventure's College, St. John's, and afterwards adopted a business career, becoming a fishery merchant at Cape Broyle in 1885. In 1893 he entered politics as Liberal member for Ferryland, becoming a prominent member of the party. In 1905, however, he broke away from the Liberals, joining first the Independent Liberal party, and later (1908) the People's party led by Sir Edward (afterwards Lord) Morris. He was chosen to represent Newfoundland on the Commission on West Indian Trade held at Jamaica in 1901, and after the outbreak of the World War occupied various important political posts. In 1917 he became Minister of Finance, and as such was largely instrumental in raising the Victory loan, and in 1918 he was successively acting Prime Minister during the absence of Lord Morris, acting Minister of Militia and acting Minister of Shipping. He was in the same year created K.B.E.

CASSEL, SIR ERNEST JOSEPH (1852-1921), Anglo-German financier, was born at Cologne March 3 1852. His father, Jacob Cassel, was a small banker in that city, and the son at the age of 16 became a clerk in the banking firm of Elspacher, but in 1870 came to London and entered the foreign banking house of Bischoffsheim and Goldsmid. There, before he was 20, he attracted notice by his skilful disentanglement of the accounts of the Khedivial loans. In 1884 he set up for himself and became largely interested in South-American finance. He reorganized the finances of Uruguay, and issued three Mexican loans, as well as acquiring the Royal Swedish railway and financing enterprises such as Vickers' absorption of the Maxim-Nordenfelt Co. and the building of the Central London railway. He also raised a Chinese loan after the war with Japan. His principal achievement was, however, the financing of the Nile irrigation work, and in connexion with that, the founding of the National Bank of Egypt. In these schemes he worked hand in hand with Lord Cromer. For these services he received a Privy Councillorship in 1902 and was created K.C.V.O. He had previously been created K.C.M.G. (1890) and he subsequently received the G.C.M.G. (1905), the G.C.V.O. (1906) and the G.C.B. (1909). He was also the recipient of decorations from the Governments of France, Sweden, Turkey and Japan. During the World War, though he had long been a naturalized British subject, an attempt was made to have his name removed from the list at the Privy Council. It did not succeed. He had retired from active financial operations in 1910. His benefactions were extensive, and included £500,000 for educational purposes, £225,000 for a hospital for nervous diseases, £50,000 to King Edward's Hospital Fund in memory of his only child, Mrs. Wilfrid Ashley, who died in 1911, besides large gifts during the war to the British Red Cross. He also built and endowed an Anglo-German Institute in 1911 in memory of King Edward VII., with whom he had been upon terms of close friendship. He was a considerable breeder and owner of race-horses; and he acquired a collection of Early English pictures, including a celebrated Raeburn. He married in 1878 Annette, daughter of R. T. Maxwell. She died in 1881. Sir Ernest died in London Sept. 21 1921.

CASSEL, GUSTAV (1866–), Swedish economist, was born in 1866. After taking his degree in mathematics at the university, he became a lecturer, and was appointed professor of national economy at the High School of Stockholm in 1904. He studied and travelled widely abroad. In addition to a number of books in Swedish, he published the following works in other languages: *Das Recht auf den vollen Arbeitsertrag* (1900); *The Nature and Necessity of Interest* (1903); *Theoretische Sozialökonomie* (1919). His *Memorandum on the World's Monetary Problems*, published by the League of Nations for the International Financial Conference in Brussels in 1920, attracted widespread attention. He was a member of many committees dealing with matters of State in Sweden and devoting much labour to the creation of a better system of budget exposition and control (1905–21). He was one of the Swedish representatives at the International Chamber of Commerce meeting in London in 1921. He became a member of *Svenska Vetenskapsakademien* and correspondent for Sweden to the Royal Economic Society.

CASTELNAU, EDOUARD DE CURIÈRES DE (1851–), French general, third son of the Marquis Michel de Curières de Castelnau, was born at Rouergue on Christmas Eve 1851. He was educated first at the Jesuit college there, and later in Paris, and entered St. Cyr in 1869. When war broke out with Prussia the young cadet was posted to an infantry regiment, and he rose to the rank of temporary captain, being given a permanent commission as lieutenant when peace was made. He was promoted captain in 1876 and commandant in 1889. By 1893 his genius for organization had become apparent, and he was called to Paris by Gen. de Miribel. He remained at the Ministry of War for some six or seven years, during which time he perfected the French system of mobilization. That system remained in 1914 fundamentally the same as it had been conceived by him in 1900. On leaving Paris de Castelnau was promoted colonel. He was later given command of a brigade, and, in 1910, of a division. When Gen. Michel left the post of generalissimo and Joffre was appointed in his stead, Castelnau was designated as his chief-of-staff in case of war. But his religious and political views—he

was nicknamed *le capucin botté*—caused him to be regarded with suspicion, and in consequence he was designated for the command, in case of war, of the II. Army in Lorraine, which command, on the outbreak of hostilities in 1914, he assumed. With Gen. Dubail (I. Army) he was responsible for the operations of Aug. and Sept. 1914 in Lorraine. The first offensive towards the Saar was unsuccessful, but his repulse of Prince Rupprecht's VI. Army on the heights of the Grand Couronné, in Aug. and Sept. 1914, not only saved Nancy but paved the way for the Marne victory. He was made grand officer of the Legion of Honour. In the beginning of the "Race to the Sea" (Sept.–Oct.) the II. Army staff and its leader took command of the forces that were pushed into the region between the Oise and the Somme, and fought a series of encounter battles which ended in the stabilization of the front. In 1915 he took command of the group of four armies which constituted the French Centre, and he was in charge of the French offensive in Champagne in the latter months of the same year. On Dec. 10 1915 he was appointed "major-general of all the armies," with the intention that he should be *ad latus*, and eventual successor of Joffre. But in practice, and partly as the result of political intrigue against him, Castelnau's rôle was reduced to that of occasionally representing the commander-in-chief. It was in this capacity that he went to Salonika in the winter of 1915–6 to inspect the condition of affairs there, and it was in this capacity also that he performed his greatest service to France when, summoned at a moment's notice to Verdun, he found the defence overpowered and disorganized by the suddenness of the German attack. The splendid part he played in steadying and inspiring the historic French resistance cannot easily be exaggerated. After a few days' work he was able to hand over the defence, systematized, reënforced and confident, to Pétain. In Jan. 1917 after the appointment of Nivelle, many years his junior, to the chief command, he was sent on a mission to Russia. Returning in March of the same year he was given command of the eastern group of armies, and in this appointment he remained till the end of the war. In Sept. 1917 he was awarded the médaille militaire. Political animosities alone prevented his being promoted to the dignity of Marshal of France, along with D'Espérey, Lyautey and Fayolle, in 1921.

CAVALRY: *see* MOUNTED TROOPS.

CAVE, GEORGE CAVE, 1ST VISCOUNT (1856–), British politician and lawyer, was born in London Feb. 23 1856. He was educated at Merchant Taylors' school and St. John's College, Oxford, and was called to the bar in 1880. He practised at the Chancery bar, and in 1904 became a K.C. In 1906 he was elected Unionist M.P. for Kingston, and on the formation of the Coalition Government in 1915 was made Solicitor-General and knighted. He became Home Secretary in 1916 on the accession of Mr. Lloyd George to power, and in this capacity was very prominent in the debates in the House of Commons on the police strike of Aug. 1918. In Nov. 1918 he resigned office, and was created a viscount, becoming in Jan. 1919 a lord of appeal.

CAVELL, EDITH (1865–1915), British nurse, was born Dec. 4 1865 at Swardeston, Norfolk, the daughter of the Rev. Frederick Cavell, vicar of that parish. She was educated at various schools in England and in Brussels, and entered the London hospital as a probationer in 1895. After five years at the hospital she was successively night superintendent at the St. Pancras infirmary, assistant superintendent at Shoreditch infirmary and matron at the Ashton New Road district home, Manchester. In 1907 she was appointed the first matron of the Berkendael medical institute, Brussels, a surgical and medical home founded by Dr. de Page as a pioneer training school for Belgian secular nurses. The institute became a Red Cross hospital on the outbreak of the World War, in which Belgian, German, French and English soldiers were nursed. From Nov. 1914 to July 1915 wounded and derelict English and French soldiers and Belgians and French of military age were hidden from the Germans and provided with false papers by Prince Reginald de Croy at his château of Bellignie near Mons; thence conducted by various guides to the houses of Edith Cavell, Louis Séverin and others in Brussels, and furnished by them with money to reach the Dutch frontier and with guides obtained through Phillipe Baucq. On Aug. 6 Edith Cavell was arrested at the Berkendael institute and sent to the prison of St. Gilles. She made three depositions to the German police, Aug. 8, 18, and 22, admitting that she had been instrumental in conveying about 60 English and 15 French derelict soldiers and about 100 French and Belgians of military age to the frontier and had sheltered the greater number in her house. Thirty-five persons were arrested. The court-martial was held, Oct. 7 and 8, before Dr. Stoeber and five judges, and a Belgian lawyer, M. Sadi Kirschen, defended Edith Cavell. On Oct. 9 Edith Cavell, Louise Thuliez, Phillipe Baucq, Louis Séverin and Countess Jeanne de Belleville were secretly sentenced to death; and of the remaining 30, 22 were sentenced to imprisonment and 8 acquitted. On the 10th the sentence was announced in secret to the prisoners. Gen. von Sauberzweig, the military governor of Brussels, ordered that "in the interests of the State" the execution of the death penalty against Baucq and Edith Cavell should be carried out immediately. At 7 A.M. on Oct. 11 they were shot at the Tir National, Brussels, in spite of the energetic attempts to secure delay made by the American minister, the secretary of the American legation and the Spanish minister, who first became aware of the sentence during the night of the 10th. The other three were reprieved. These were the first death sentences imposed by the Germans in Belgium for recruiting as opposed to espionage. On May 15 1919 the body was removed to Norwich cathedral, after a memorial service in Westminster Abbey. A memorial statue, by Sir G. Frampton, is erected opposite the National Portrait Gallery, London.

See *The Case of Miss Cavell from the Unpublished Documents of the Trial*, interpreted by Ambroise Got; Sadi Kirschen, *Devant les Conseils de Guerre Allemands* (1919); *Correspondence with the United States Ambassador respecting the Execution of Miss Cavell at Brussels*, Cd. 8013, Stationery Office (1915).

CAVIGLIA, ENRICO (1862–), Italian general, was born at Finalmarina (Genoa) May 4 1862. He entered the artillery, and his early years in the army were spent between this branch of the service and the general staff, but on attaining his majority he passed to the infantry arm. He served in Eritrea and in the Italo-Turkish War and, as a captain of the general staff, was attached to the Japanese army during the Russo-Japanese War. In Feb. 1914 he was nominated vice-director of the Military Geographical Institute in Florence. On Italy's entry into the World War he served as a colonel on the general staff, and in Aug. 1915 he was promoted to major-general and given command of the Bari Brigade. In June 1916 he took over the 29th Div. and two months later was promoted lieutenant-general "for war merit." In July 1917 he was given command of the XXIV. Corps, which under his direction broke through the Austrian lines on the Bainsizza plateau. After Caporetto he took command of the VIII. Corps and subsequently of the X., and in June 1918, after the Austrian offensive on the Piave, he was chosen to command the VIII. Army. Under his leadership the VIII. Army played an important part in the final victory of Vittorio Veneto. From Jan. to June 1919 Caviglia was Minister of War, and as such became a senator, and in Nov. of the same year he was promoted army general. In Jan. 1920 he took over the command of the troops in Venezia Giulia, with headquarters at Trieste. He had a very difficult task to perform, since the discipline of the troops had been severely shaken by the example of D'Annunzio's Fiume raid, and there was danger of trouble on the frontier with the Yugoslavs. Caviglia restored discipline, and showed both firmness and tact in dealing with these delicate problems. When it became evident that only force would drive D'Annunzio from Fiume he did not hesitate to carry out his task.

CECIL, LORD HUGH RICHARD HEATHCOTE (1869–), English politician (*see* 24.76), youngest son of the 3rd Marquess of Salisbury, was born Oct. 14 1869, and was educated at Eton and University College, Oxford. He obtained a first class in history in 1891 and was elected a fellow of Hertford College. He gained his first insight into politics as one of his father's private secretaries, and was returned to Parliament as a Conservative for Greenwich in 1895. Ecclesiastical questions were

those in which he took the keenest interest, and he became an active member of the Church party in the House, resisting the attempts that were made by Nonconformists and Secularists to take the discipline of the Church out of the hands of the archbishops and bishops, and to remove the bishops from their seats in the House of Lords. In these debates he showed remarkable oratorical power and loftiness of tone, and established a reputation which was confirmed and heightened during the progress through Parliament of Mr. Balfour's Education bill of 1902. In an earnest speech on the second reading he maintained that for the final settlement of the religious difficulty there must be coöperation between the Church of England and nonconformity, which was the Church's natural ally; and that the only possible basis of agreement was that every child should be brought up in the belief of its parents. The ideal to be aimed at in education was the improvement of the national character. In the latter stages of the bill's progress he warmly resented an amendment approved by the House and taken over by the Ministry giving the managers, instead of the incumbent of the parish, the control of religious education in non-provided schools. This was not the only point on which he showed considerable independence of the Government of which his cousin Mr. Balfour was the head. He and Mr. Winston Churchill gathered round them a small group of young and able Conservative members, whose independent proceedings attracted some attention in Parliament, and who formed a sort of pale reflection of Lord Randolph Churchill's Fourth party. He dissented from the beginning from Mr. Joseph Chamberlain's policy of tariff reform, pleading in Parliament against any lowering of our idea of empire into that of a "gigantic profit-sharing business." He took a prominent position among the "Free Food Unionists," and consequently was attacked by the tariff reformers and lost his seat at Greenwich in 1906. He did not return to Parliament until 1910 when his high character and his academic outlook recommended him, in spite of his hostility to tariff reform, as a fitting member for Oxford, his own university. He threw himself immediately with passion into the struggle against the Ministerial Veto Resolutions, comparing the Asquith Government to "thimble-riggers." In the next year he was active in the resistance to the Parliament bill, treating Mr. Asquith as a "traitor" for his advice to the Crown to create peers, and taking a prominent part in the disturbance which prevented the Prime Minister from being heard on July 24 1911. But he never quite regained the authority which he had possessed in the House in the early years of the century. He strongly opposed the Welsh Church bill; and he denounced the Home Rule bill, in a picturesque phrase, as reducing Ireland from the status of a wife to that of a mistress—she was to be kept by John Bull, not united to him. During the World War Lord Hugh joined the Flying Corps, becoming a lieutenant R.F.C. in 1915, and in that capacity he severely censured, in debate in 1918, the treatment of Gen. Trenchard by the Government. He also served in 1917 as a member of the commission to enquire into the Mesopotamian expedition. In Parliament he pleaded for lenient treatment of conscientious objectors to the Military Service bills; and endeavoured unsuccessfully to relieve them of disability under the new Reform Act. After the war he took a less active part in politics, but generally found himself in agreement with his brother Lord Robert, whom he followed into Opposition in 1921. (G. E. B.)

CECIL, LORD (EDGAR ALGERNON) **ROBERT** (1864-), English lawyer and statesman (*see* 24.76), third son of the 3rd Marquess of Salisbury, was born Sept. 14 1864. Educated at Eton and University College, Oxford, he obtained a second class in law in 1886. He was a prominent speaker at the Oxford Union, and obtained political experience as one of his father's private secretaries from 1886 to 1888; but he determined to approach an active political career by way of the bar, and was called by the Inner Temple in 1887. He made such progress in his profession that he could take silk in 1899; and he established his position as a sound lawyer and capable advocate. It was not till 1906 that he entered Parliament as Conservative member for E. Marylebone, and he was one of the principal critics of Mr. Birrell's abortive Education bill of that year, contending throughout that facilities should be afforded for the training of children in the religion of their parents. In this he carried on the work of his younger brother, Lord Hugh Cecil, now out of Parliament. But, though a vigilant champion of Church interests, as for instance in opposition to the Deceased Wife's Sister's bill, he also took up, in conjunction with Mr. Harold Cox on the Liberal side, an attitude of individualist opposition to Socialist measures, such as Miners' Eight Hours, Old Age Pensions, and Increment Taxation bills. He also dissociated himself from the tariff reform policy of his party. He had won a leading place among the private members of the House, when Parliament was dissolved in 1910. He then retired from Marylebone, owing to the strong opposition of the tariff reformers, and failed to secure election as a Unionist free trader at Blackburn. In the second General Election of 1910 he stood for N. Cambridgeshire but was beaten by Mr. Neil Primrose. However, he returned to Parliament at a by-election in 1912 as member for the Hitchin division of Herts., the tariff reform issue being now in abeyance. He immediately resumed his prominent position in the House, and was active in his opposition to schemes of socialism and disestablishment. He was a leading advocate of woman suffrage; and, though not palliating militancy, was a strong critic of forcible feeding. Ultimately, after women had been granted the suffrage under the Reform Act of 1918, he had the satisfaction of carrying a resolution permitting them to sit in Parliament.

By the time of the outbreak of the World War his claims to recognition among the Unionist leaders were so considerable that he was appointed Under-Secretary for Foreign Affairs in the first Coalition Ministry. His functions mainly concerned the vitally important question of blockade; and when there was a considerable outcry against the comparative ineffectiveness of our blockade, a new Ministry of Blockade was constituted, in Feb. 1916, with Lord Robert as minister. In that capacity he announced in June 1916, to the general satisfaction, that the Allies had decided to abandon altogether the Declaration of London. His work was so much appreciated that he was retained both as Minister of Blockade and as Foreign Under-Secretary in Mr. Lloyd George's Ministry of Dec. 1916. In July 1918 the labours of the Foreign Office became so considerable that he was relieved of the Ministry of Blockade, and became Assistant Secretary of State for Foreign Affairs, retaining that important post through the negotiations which resulted eventually in the Armistice; but he resigned on the eve of the General Election, on the ground that he could not support the decision of the Coalition Ministry to treat Welsh disestablishment as a *fait accompli*. Though out of office, he nevertheless went over to Paris in 1919 to help to fashion the League of Nations, of which from the first he was an enthusiastic advocate. He was subsequently indefatigable in pressing its claims upon Parliament and people, urging that the sooner enemy nations, including Germany, could be included in it with safety, the better. In 1920 he attended the first assembly of the League at Geneva as the representative of South Africa at the request of Gen. Smuts, himself a convinced believer in this new international organ. He also took a large share in Parliamentary debate, appearing, for instance, as a strong supporter of the Church Enabling bill, and criticizing the policy of the War Graves Commission and the regulation headstone which it recommended. In spite of his protestation, when he left the Government, that except on the one point of the Welsh bill, he was a convinced supporter, he steadily drifted into opposition, being especially alienated by their gigantic budgets, and by the policy of reprisals in Ireland. At one time both extreme Tory and visionary Radical thought they saw in him the leader of the future; but when he ultimately took his seat on the Opposition front bench in 1921, he did not appear to carry anyone across the House with him, except his brother, Lord Hugh.

Lord Robert Cecil married, in 1889, Lady Eleanor Lambton, daughter of the 2nd Earl of Durham. (G. E. B.)

CELLULOSE (*see* 5.606).—The decade following the year 1910, including the experiences of the World War, fully confirmed

the scientific estimate of the importance of cellulose as an industrial product. The production of cellulose nitrate, the basis of modern military explosives, attained in 1918 to 5,000 tons per week in America alone Another ester derivative of cellulose, the acetate, took a prominent and perhaps unique position in regard to war material, as the basis of the dope-dressing applied to the textile coverings of the wings of aeroplanes. The intensive production of these synthetic derivatives necessarily involved extensions of research with resulting additions to our knowledge of cellulose as a chemical individual, and in evidence of the magnitude of these industries and the wide scope of their technology we may refer to E. C. Worden's elaborate treatise on the "Nitro Cellulose Industries." In evidence of the rapid growth of the subject in its wider aspects we may refer to the same author's treatise (projected in 1921), to be issued in ten volumes over a period of years.

Progress of investigation and knowledge of cellulose as a chemical individual was in 1921 more definitely marked as following three independent lines, obviously converging towards a constitutional formula or expression: (1) The study of cellulose as it is; a colloidal substance, perhaps the prototype of colloids, and of its immediately related derivatives, having closely similar physical properties. (2) The study of its resolutions by reaction to compounds of C_{12}–C_6 dimensions, also carbo-hydrates, which are presumed to be actual components, and, being compounds of known constitution, to be the foundation of an integral formula of constitution of the parent substance. With this primary or fundamental method is associated the study of the whole range of reactions and interactions of cellulose as diagnostic of its component groups. (3) The study of resolutions (a) to highly complex mixtures of products, by destructive distillation, or by natural processes of which the ultimate residual products are humus-lignite coal; (b) to ultimate products of C_3–C dimensions by symbiotic bacterial process of decomposition.

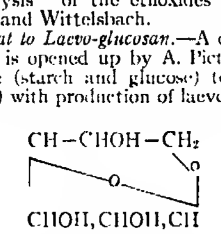
Of the above, No. 2 is the line or method of systematic chemistry, and its exponents detach themselves in the main from all considerations of the natural history and physiology of the celluloses: their organized structure and colloidal characteristics are treated as of subordinate moment, and the technology of the cellulose industries is for the most part ignored. Nevertheless, the contributions of this school of workers are of first importance.

The following are to be noted:—

Resolution to Dextrose by ester formation, solution in water, and progressive hydrolysis of esters: (*a*) Reaction with H_2SO_4—Ost & Wilkening (1910–3) confirm Flechsig (1882) in the general conclusion that cellulose is quantitatively converted to dextrose; (*b*) reaction with HCl. Aq. Willstätter and Zechmeister (1913), rediscovering the solvent action of the acid at maximum concentration (W. A. Miller, *Organic Chemistry*, p. 130, ed. 1869), apply the reaction to an analogous process of resolution and further confirm the generally accepted relationship.

Resolution to Biose (cellobiose) and Monose (dextrose) following conversion into (*a*) acetic ester and (*b*) methyl and ethyl ethers or ethoxides (*c*) mixed (acetic) ester—ether derivatives. By the former, Ost has demonstrated the production of the biose as octacetate with the monose as pentacetate, the joint yield calculated to the monose representing 90% of the cellulose. By resolution of the methoxide derivatives Denham and Woodhouse obtain 1.2.5.—trimethyl glucose and establish a critical constitutional point in regard to current discussion of the several alternative formulae based on the general acceptance of the quantitative cellulose—dextrose relationship. The "acetolysis" of the ethoxides has been specially investigated by Hess and Wittelsbach.

Resolution by Heat to Laevo-glucosan.—A direction of research of critical importance is opened up by A. Pictet and co-workers, and subjecting cellulose (starch and glucose) to distillation *in vacuo* (12.14 mm. at 210°) with production of laevo-glucosan



in large yield (40 %).

Helvetica Chem. Acta, 1918–20; also P. Karrer, *ibid.* 1920.

These notes are sufficient as evidence of the rapid advance of knowledge due to the active work and discussions of the chemists whose *ultima thule* is expressed by a recent contributor—"the time would now seem to be opportune when the question of direct synthesis should be undertaken." This project issues from a comprehensive critical discussion of the research work of the last decade (H. Hibbert, "The Constitution of Cellulose," *Jour. Ind. Eng. Chem.* 13 (1921), 256 *et seq.*), of which the following is characteristic—"Cellulose is thus nothing more than a polymerised dextrose glucoside of dextrose."

As indicated above, the perspective of this school of workers is that of systematic chemistry, self-contained, and perhaps arbitrarily delimited from the objective relationships of cellulose as a dominant factor of the organic world and a main subject of natural history of which the complementary chapters are those of human industries.

Investigations from this point of view have also established points of critical importance:—

1. The primary importance of specific volumes of cellulose and derivatives, for the adequate interpretation of reaction in this field.
2. The reactive continuity of cellulose: it reacts as a system, whereas systematic chemistry interprets its reactions in terms of a "molecular" individual.
3. Cellulose is profoundly modified, structurally and constitutionally by mechanical shock and strain: as it is in degree proportionate to the active influence by all forms of energy (light, electrical current, heat).
4. Cellulose is resolved by bacteria to ultimate products of C_3–C_1 dimensions: and recent research has brought these reactions under such control that the massive treatment of the "normal" celluloses is an industrial operation of the order of starch fermentations. It is noteworthy that these transformations are in the main direct, and do not involve the transitional phases of the familiar operations of the brewer and distiller.
5. Lastly, as a negative point and a general criticism of the conclusions of the school of systematic chemists, the cellulose-dextrose relationship postulating a conversion of 100 of cellulose to 111 dextrose is not established. Research in this field is limited to cotton cellulose. If extended to esparto cellulose (a type sharply and characteristically differentiated), to the wood celluloses, or even to cotton cellulose modified by mercerization and other treatments yielding products which maintain the structural characteristics, it would be recognized in the results that the "constitution of cellulose" is a problem of the dimensions of a continent rather than of a village: or possibly, that the "synthesis of cellulose" is an ideal, illusory, however useful. (The reader is referred to C. F. Cross, *Canter Lectures* "Cellulose" *J. R. Soc. Arts* 1920; and to papers by same author in *J. Soc. Dyers and Col.* 1918–20.)

Cellulose Products in War Service (1914–8).—The following note on the development of the technology of the cellulose nitrates to meet the exacting requirements of the fighting services is contributed by Sir R. Robertson, who, as director of research at Woolwich, was responsible for the chemical technical control of the manufacture.

In England cellulose nitrates were used during the war in the Land Service for the manufacture of cordite R.D.B., and for Admiralty cordite; towards the end of the war a small proportion was used for making nitro-cellulose powder. By far the largest use was for cordite R.D.B., as this propellant was ultimately manufactured at the rate of about 2,000 tons a week, involving the nitration of about 700 tons of purified cellulose. For Admiralty cordite over 100 tons a week of sliver cotton was prepared, this material being specially selected and purified. The cotton for the nitro-cellulose powders was a high grade of "linters."

The preparation of cellulose for the Land Service assumed the proportion of a great industry. The raw materials were drawn from wastes from the spinning-mills not only of England, but also of Egypt, India, and of other countries. It was soon found that the variations in treatment of the crude wastes produced a product which gave variable results after it had been nitrated, especially when it reached the stage of its incorporation with nitro-glycerine and gelatinization by means of ether-alcohol. All the materials for producing cellulose for nitration were therefore coördinated under the Department of Explosives Supply, which instituted a system of chemical control of the product, with the objects of obtaining uniformity of production, reducing the quantity of impurities, and obtaining a suitable low viscosity. A uniform process of "kiering" (boiling under pressure with a lye of caustic soda) was introduced, and under strict supervision a

product was obtained of remarkable purity, considering its origin, and suitable for the manufacture of cordite R.D.B.

The result is an example of the successful application of chemical technical control to secure a product of standard uniform quality, and by reason of the quality of low viscosity of the nitrated product a very considerable economy in the ether-alcohol, for gelatinizing the nitro-cellulose. The methods for determining the viscosity of the cellulose, and a method for determining ligneous impurities in the cellulose (*Trans. Chem. Soc.* 1920, 117, 473 and 479, and *Jour. Soc. Chem. Industry*, 1920, 39, 81 T) were worked out at the Research Department, Woolwich. The application of this work on cellulose by the Department of Explosives Supply is described in *Jour. Soc. Chem. Industry*, vol. 39, 333 T.

The United States supplied large quantities of nitro-cellulose propellant for the Allies and for its own army, and used as raw material a considerable proportion of the shorter fibre "waste" from the delinted cotton seed. During the last three months of the war the total production of cellulose nitrate material in the United States was at the rate of 5,000 tons a week. This propellant consisted of gelatinized nitro-cellulose with the addition of a stabilizer, but it contained no nitro-glycerine.

In the enemy countries the shortage of cotton supplies was met by the extensive employment of wood cellulose, papermakers' cellulose pulp, purified by alkaline hydrolytic treatments, which modify the cellulose to a nearer approximation to the standard cotton cellulose.

Cellulose Acetate.—The cellulose acetates are the chemical analogues of the nitrates, and a specially prepared acetone soluble acetate was extensively used in dressing the textile coverings of aeroplane wings, the treatment having an ensemble of effects, producing shrinkage of the fabric *in situ*, thus a taut finish, a smooth surface and the water-resistant quality obviously indispensable.

In England the manufacture of the product was developed by The British Cellulose Co. on the basis of the Dreyfus patents who, since 1918, have been engaged in perfecting the "Artificial Silk" based upon the acetate. This product has the external features of the cellulose-"Silks," with certain points of superiority of the ester-derivative as a chemical substance, notably the water-resistant quality and lower specific gravity. On the other hand, certain defects as a textile thread, with high costs of manufacture, keep the present production to a definitely limited scale.

Other lines of development followed more particularly under the stress of war conditions and the resulting contributions to progress are treated in the article *Fibres*. One section requires further mention here in introducing the comprehensive subject of cellulose as a dominant factor of the organic world. Recent research work has established on a basis of direct proof that cellulose is assimilated by the Herbivora and has therefore a positive value as food-stuff: a conclusion which rested previously on inferential evidence from physiological-chemical statistics. The positive flesh-forming function postulates conversion of the cellulose into water-soluble derivative, carbo-hydrates probably, as a digestive process in which the animal secretions are operative; at the same time there are the distinctive fermentations, previously mentioned, of the celluloses to ultimate products, under bacterial action, which are known to occur in the digestive tract of the animal and of which the physiological value or function remains undetermined.

Such fermentations, characterized by the researches of Omeliansky and Macfadyen, in regard to "Thermophilic" bacteria, and hitherto "pure" cultures of these have however been observed as processes of long duration. The current developments of an industrial research syndicate, Power Spirit, Ltd. (Stockton-on-Tees and Epsom), and H. Langwell are establishing such fermentations as industrial methods for the production of acetic acid and alcohol.

Symbiotic bacterial growths at 30°–40° C. are now controlled, by the associated chemical conditions of reaction, to produce ether as main product, and to break down the celluloses in massive quantities in the relatively short periods which are required for starch fermentations.

In another field, which is also comprised in the vast domain of the natural history of "cellulose," researches are being actively prosecuted in elucidation of the constitution of the peat-lignite coal groups of natural products, obviously derived from, and transformation products of, "cellulose" in the inclusive sense of the term.

The *Hemi-Celluloses* have a typical representative in the parenchyma of the "locust" bean, the seeds of *cevatonia siliqua*. On digestion with water the cellular tissue is transformed into a series of hydrated gel-products which mix with the water to pseudo-solutions of extreme specific viscosity. The products (Tragasol) find extensive application as a dressing or "finish" of textile goods and leathers. These hydrated hemi-celluloses combine with tannic acid to form characteristic precipitates which are reversible gels. The reactions and properties of these compounds are the basis of new processes of hide tanning. An exposé of these methods with the rationale of principles will be found in an article "Colloidal Tannin Compounds" (C. F. Cross and others) *J. Soc. Dyers and Colourists* 35 (1919), 62–8.

The *Compound-Celluloses.*—The ligno-celluloses, represented by the typical fibre-substance of jute (bast-fibre), are the subject of a paper "Lignum Reactions and Constitution,"—Cross and Bevan, *J. Soc. Dyers and Col.* 32 (1916), giving an account of researches which establish a statistical constitutional formula for the lignine complex of which a diketohydrobenzene and a hydro-pyrone group are characteristic; in addition, as secondary components are ketene and methoxy groups.

The ligneous components of perennial ligno-celluloses—the wood of forest trees—have been further investigated by: Klason, *Berl. Ber.* 53 (1920), 706, 1864; Heuser and Skiöldebrand, *Z. Angew. Chem.* 32 (1919), 41; Hägglund, *Chem. Zentr.* 90 (iii) (1919), 186; Hönig and Fuchs, *Monatsh.* 40 (1919), 341.

The *Cuto-Celluloses*, the protective epidermal covering of plant organs, especially of the organs or parts functioning in active assimilation, are relatively inaccessible by reason of their minute proportion by weight or mass, and from the fact that they require chemical treatment more or less severe for their isolation as a separated tissue, which treatments produce considerable modifications of the parent substances. The epidermal tissue "raffia" on the other hand is separated by merely stripping from a palm leaf; being thus obtainable in massive quantity and investigated as a "parent" substance, it is an attractive subject for developing this field of research. It is however a mixed tissue of which the actual epidermis constitutes about 40%: therefore, the quantitative data resulting from investigation require inferential interpretation in regard to the latter. Recent researches establish the general character of the tissue complex as an (oxidized) cellulose—ligno-cellulose ether ester with acid functions. The characteristic acid component of the ester is an unsaturated acid $C_{12}H_{18}O_3$—containing 1 COOH and 1 OH group "Raffia and Cuto-cellulose"—Cross and Bevan, *J. Soc. Dyers and Col.* 35 (1919), 70–5. (C. F. C.)

CENSORSHIP.—The World War brought about various forms of restriction of publicity in the shape of a censorship, which provides a new chapter in the history of the Press Laws (*see* 22.299).

(1) United Kingdom.—The following note to newspaper editors, dated July 27 1914, was the first official intimation to the British press of the approach of war:—

"At a meeting of the Admiralty War Office and Press Committee, held this afternoon, it was resolved that as, in view of the present situation, the authorities may have to take exceptional measures, the Press should be asked to refrain from publishing any information relative to movements of British warships, troops, and aircraft, or to war material, fortifications, and naval and military defences, without first communicating with the Admiralty and War Office respectively in accordance with the arrangement which was notified to you by me in January of last year.

"Having regard to the nature of the case it is found impossible further to indicate the character of the information the publication of which is undesirable in the national interests. The request does not affect the dissemination of news concerning ordinary routine movements or training on the part of the Navy or the Army; its object is to prevent the appearance of anything concerning steps of an exceptional kind which may be rendered necessary by the existing state of affairs.

"I may add that the authorities from time to time will continue to issue such information as may be made public."

The "Admiralty War Office and Press Committee" had been formed in 1911, mainly through the efforts of Mr. (afterwards Sir) Reginald Brade, to establish a permanent *liaison* in peace and war between the Admiralty and the War Office on the one hand and the Press on the other. The Committee consisted of representatives of the two departments and the London and provincial newspapers. Apart from the Official Secrets Act, no legislation existed which enabled the authorities or the Committee to suppress the publication of naval and military information. Notwithstanding this, the whole of the newspapers loyally observed the Committee's request, followed by others of a more detailed character, dated July 29 and 30 respectively. The result was that the British preparations were made with such secrecy that the Germans subsequently admitted that on Aug. 20 they knew neither when nor where the British troops were landed, nor their strength.

the scientific estimate of the importance of cellulose as an industrial product. The production of cellulose nitrate, the basis of modern military explosives, attained in 1918 to 5,000 tons per week in America alone Another ester derivative of cellulose, the acetate, took a prominent and perhaps unique position in regard to war material, as the basis of the dope-dressing applied to the textile coverings of the wings of aeroplanes. The intensive production of these synthetic derivatives necessarily involved extensions of research with resulting additions to our knowledge of cellulose as a chemical individual, and in evidence of the magnitude of these industries and the wide scope of their technology we may refer to E. C. Worden's elaborate treatise on the " Nitro Cellulose Industries." In evidence of the rapid growth of the subject in its wider aspects we may refer to the same author's treatise (projected in 1921), to be issued in ten volumes over a period of years.

Progress of investigation and knowledge of cellulose as a chemical individual was in 1921 more definitely marked as following three independent lines, obviously converging towards a constitutional formula or expression: (1) The study of cellulose as it is; a colloidal substance, perhaps the prototype of colloids, and of its immediately related derivatives, having closely similar physical properties. (2) The study of its resolutions by reaction to compounds of C_{12}–C_6 dimensions, also carbo-hydrates, which are presumed to be actual components, and, being compounds of known constitution, to be the foundation of an integral formula of constitution of the parent substance. With this primary or fundamental method is associated the study of the whole range of reactions and interactions of cellulose as diagnostic of its component groups. (3) The study of resolutions (*a*) to highly complex mixtures of products, by destructive distillation, or by natural processes of which the ultimate residual products are humus-lignite coal; (*b*) to ultimate products of C_3–C dimensions by symbiotic bacterial process of decomposition.

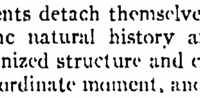
Of the above, No. 2 is the line or method of systematic chemistry, and its exponents detach themselves in the main from all considerations of the natural history and physiology of the celluloses: their organized structure and colloidal characteristics are treated as of subordinate moment, and the technology of the cellulose industries is for the most part ignored. Nevertheless, the contributions of this school of workers are of first importance.

The following are to be noted:—

Resolution to Dextrose by ester formation, solution in water, and progressive hydrolysis of esters: (*a*) Reaction with H_2SO_4—Ost & Wilkening (1910–3) confirm Flechsig (1882) in the general conclusion that cellulose is quantitatively converted to dextrose; (*b*) reaction with HCl. Aq. Willstätter and Zechmeister (1913), rediscovering the solvent action of the acid at maximum concentration (W. A. Miller, *Organic Chemistry*, p. 130, ed. 1869), apply the reaction to an analogous process of resolution and further confirm the generally accepted relationship.

Resolution to Biose (cellobiose) and Monose (dextrose) following conversion into (*a*) acetic ester and (*b*) methyl and ethyl ethers or ethoxides (*c*) mixed (acetic) ester—ether derivatives. By the former, Ost has demonstrated the production of the biose as octacetate with the monose as pentacetate, the joint yield calculated to the monose representing 90% of the cellulose. By resolution of the methoxide derivatives Denham and Woodhouse obtain 1.2.5.—trimethyl glucose and establish a critical constitutional point in regard to current discussion of the several alternative formulae based on the general acceptance of the quantitative cellulose—dextrose relationship. The " acetolysis " of the ethoxides has been specially investigated by Hess and Wittelsbach.

Resolution by Heat to Laevo-glucosan.—A direction of research of critical importance is opened up by A. Pictet and co-workers, and subjecting cellulose (starch and glucose) to distillation *in vacuo* (12.14 mm. at 210°) with production of laevo-glucosan



in large yield (40 %).

Helvetica Chem. Acta, 1918–20; also P. Karrer, *ibid.* 1920.

These notes are sufficient as evidence of the rapid advance of knowledge due to the active work and discussions of the chemists whose *ultima thule* is expressed by a recent contributor—" the time would now seem to be opportune when the question of direct synthesis should be undertaken." This project issues from a comprehensive critical discussion of the research work of the last decade (H. Hibbert, " The Constitution of Cellulose," *Jour. Ind. Eng. Chem.* 13 (1921), 256 *et seq.*), of which the following is characteristic—" Cellulose is thus nothing more than a polymerised dextrose glucoside of dextrose."

As indicated above, the perspective of this school of workers is that of systematic chemistry, self-contained, and perhaps arbitrarily delimited from the objective relationships of cellulose as a dominant factor of the organic world and a main subject of natural history of which the complementary chapters are those of human industries.

Investigations from this point of view have also established points of critical importance:—

1. The primary importance of specific volumes of cellulose and derivatives, for the adequate interpretation of reaction in this field.
2. The reactive continuity of cellulose: it reacts as a system, whereas systematic chemistry interprets its reactions in terms of a " molecular " individual.
3. Cellulose is profoundly modified, structurally and constitutionally by mechanical shock and strain: as it is in degree proportionate to the active influence by all forms of energy (light, electrical current, heat).
4. The Committee consisted of representatives of the two departments and the London and provincial newspapers. Apart from the Official Secrets Act, no legislation existed which enabled the authorities or the Committee to suppress the publication of naval and military information. Notwithstanding this, the whole of the newspapers loyally observed the Committee's request, followed by others of a more detailed character, dated July 29 and 30 respectively. The result was that the British preparations were made with such secrecy that the Germans subsequently admitted that on Aug. 20 they knew neither when nor where the British troops were landed, nor their strength.

On Aug. 7 the Press Bureau (the outward and visible sign of the censorship) was established by Lord Kitchener, acting in conjunction with Mr. Churchill, then First Lord of the Admiralty. The first Director of the Bureau was Mr. F. E. Smith, M.P., afterwards Lord Birkenhead. He was followed by Sir Stanley (afterwards Lord) Buckmaster, who was succeeded by Sir Frank Swettenham jointly with the late Sir Edward Cook. In the first instance the Bureau was located in a tumble-down building in Whitehall, backing on to the Admiralty. Later it was removed to the United Service Institution.

The objects of the Press Bureau were:—

(1) The censoring of incoming and outgoing press cablegrams and certain inland press messages, chiefly those passing through the General Post Office. By order of the Government the former were diverted to the Bureau by the Post Office and cable companies.

(2) To issue to the newspapers official information received from other Government departments.

(3) To censor matter voluntarily submitted by the Press.

It should be mentioned here that the censoring of news by the Bureau was, for the most part, carried out in accordance with the wishes of the various Government departments concerned—the Admiralty, the War Office, the Foreign Office, the Home Office, etc., with the result that the whole of the criticism was directed against the Bureau, which served as a sort of buffer state. In short, the Directors of the Bureau had to do as they were told. It was an open secret that in some instances they disagreed with the policy they were called upon to enforce. On the whole they performed a thankless duty with considerable ability. Upon Lord Birkenhead fell the difficult task of organizing the department and establishing regulations to deal with conditions altogether unprecedented. The work of his successors was hardly less onerous as fresh problems constantly presented themselves throughout the war. About fifty censors were employed, comprising naval officers (appointed by the Admiralty), military censors (appointed by the War Office), and civilians, including ex-civil servants, barristers and journalists.

The Bureau was kept open day and night. On Aug. 8 1914 the Defence of the Realm Act was passed, followed a few days later by a series of censorship regulations as authorized by its provisions. These regulations were of a far-reaching character. They were amended from time to time and in their final form stood as follows:

Reg. 18. No person shall, without lawful authority, collect, record, publish or communicate, or attempt to elicit, any information with respect to the movement, numbers, description, condition or disposition of any of the forces, ships, or aircraft of His Majesty or any of His Majesty's allies, or with respect to the plans or conduct, or supposed plans or conduct, of any operations by any such forces, ships, or aircraft, or with respect to the supply, description, condition, transport or manufacture, or storage, or place or intended place of manufacture or storage of war material, or with respect to any works or measures undertaken for or connected with, or intended for the fortification or defence of any place, or any information of such nature as is calculated to be or might be directly or indirectly useful to the enemy, and if any person contravenes the provisions of this regulation, or without lawful authority or excuse has in his possession any document containing any such information as aforesaid, he shall be guilty of an offence against these regulations. . . .

No person shall, without lawful authority, publish or communicate any information relating to the passage of any ship along any part of the coast of the United Kingdom. . . .

Reg. 27. No person shall by word of mouth or in writing or in any newspaper, periodical, book, circular, or other printed publication—

(a) Spread false reports or make false statements; or

(b) spread reports or make statements intended or likely to cause disaffection to His Majesty, or to interfere with the success of His Majesty's forces or of the forces of any of His Majesty's allies by land or sea, or to prejudice His Majesty's relations with foreign powers; or

(c) spread reports or make statements intended or likely to prejudice the recruiting of persons to serve in any of His Majesty's forces, or in any body of persons enrolled for employment under the Army Council or Air Council or entered for service under the direction of the Admiralty, or in any police force or fire brigade, or to prejudice the training, discipline or administration of any such force, body, or brigade; or

(d) spread reports or make statements intended or likely to undermine public confidence in any bank or currency notes which are legal tender in the United Kingdom or any part thereof, or to prejudice the success of any financial measures taken or arrangements made by His Majesty's Government with a view to the prosecution of the war; . . .

The maximum penalty was imprisonment with or without hard labour for six months or a fine not exceeding £100, or both. Prosecutions had to be instituted by the Director of Public Prosecutions in England, the Lord Advocate in Scotland, or the Attorney-General in Ireland. The Regulations (Regulation 51) gave the Government power in certain cases to seize the plant of a newspaper which had offended, or in others to seize the type on suspicion that an offence was about to be committed (Reg. 51*a*).

These regulations placed heavy shackles upon the Press, but in the main they were accepted with patriotic equanimity. Prosecutions were few in number, which is surprising considering the length and magnitude of the war. It will be seen that the Press Bureau had no power to insist upon the submission of matter for censorship. The responsibility rested with the editor, who could publish what he thought fit, subject to complying with the Defence of the Realm Regulations. If he erred he was liable to prosecution, and even if the matter were passed by the Bureau he would not be relieved of the responsibility for infringement of the regulations, although the fact might be pleaded in mitigation. From time to time secret instructions were issued by the Bureau for the information and guidance of editors. At the end of the war these numbered several hundred. At intervals they were collected and issued in pamphlet form. For the most part they consisted of hints and elucidations concerning matters which in general terms were covered by the regulations quoted above.

Cable and Postal Censorship.—In addition to the Press Bureau, censorships of incoming and outgoing cables, letters and parcels, were established by the War Office at the commencement of the war with the three-fold object of preventing information of military value from reaching the enemy, of acquiring similar information for British purposes and of checking the dissemination of information likely to be useful to the enemy or prejudicial to the Allies. Chief Censors of both departments were appointed by the Army Council.

The cable censorship extended throughout the Empire, and the number of persons employed in the United Kingdom, exclusive of those in the Press Bureau, was about 200. In other parts of the Empire they numbered about 400. The size of the task may be judged from the fact that 30,000 to 50,000 telegrams passed through the hands of the censors in the United Kingdom every twenty-four hours.

In the postal censorship, exclusive of clerical and post-office employees, a staff of 5,500 was employed comprising 3,451 women and persons with a knowledge of almost every foreign language. The department was divided into three branches—(1) the section which censored the correspondence of prisoners of war in the United Kingdom and British prisoners in enemy countries; (2) the private correspondence section which dealt with letters from members of the British Expeditionary Force, letters and parcels to and from certain foreign countries, press messages sent abroad by other means than cable, and newspapers. In this branch more than a ton of mail matter was censored every week, exclusive of parcels; (3) the trade branch, which censored commercial correspondence with certain foreign countries, amounting to nearly four tons per week.

At the commencement, the system caused serious irritation amongst the commercial classes, to which point was given by foolish and, in some cases, amusing errors made by the censors. It must, however, be recognized that on the whole the work was well and efficiently done. The officers chiefly responsible were Gen. (afterwards Sir George) Macdonogh, Gen. Cockerill, Col. A. E. Churchill followed by Lord Arthur Browne, Chief Cable Censor, and Col. G. S. H. Pearson followed by Col. A. S. L. Farquharson, Chief Postal Censor.

In the early part of the war a great outcry was made by the British (and also the American) newspapers concerning the working of the Press cable censorship in London. In numerous instances, Press cables received in England were entirely suppressed without notice to the sender or addressee, and in others

messages were so mutilated as to be indecipherable. These complaints led to a declaration by the Foreign Office on Dec. 20 1915, that in future incoming press cablegrams would not be censored from a political point of view; the responsibility of publishing would be with the editors who knew that a prosecution against them, under the Defence of the Realm Act, might result from the publication of anything endangering the good relations between Great Britain and the Allies or the Neutrals. This change, however, only applied to censorship by the Foreign Office, and messages were still liable to censorship from the point of view of other departments (Admiralty, War Office, Home Office or Treasury, for instance) consulted by the Press Bureau—a system which continued until 1919.

Censorship at the Front.—It remains to deal with the censorship of messages from authorized British correspondents on the several fronts. These were primarily (and compulsorily) censored by military censors on the field, but they all came through the Press Bureau, which occasionally exercised a super-censorship. The methods adopted caused constant grumbling and discontent.

The casualty lists were rigidly and, no doubt, properly suppressed, but owing to the representations of the Newspaper Proprietors' Association they were supplied periodically for the confidential information of editors.

In France, at the outset, no correspondents were allowed. In Sept. 1914, owing to demands by the Newspaper Proprietors' Association for more information, an official eye-witness, Gen. Swinton, was appointed. He wrote according to order, and no question of censorship arose. The news supplied was meagre and inappropriate, and it did not take long for mischievous results to accrue, and the official mind was at first disposed to blame the Press for what was wrong in the "publicity" of the moment. On March 12 1915, the following notice was issued by the Press Bureau, warning the newspapers that they were too optimistic in the pictures they gave of what was happening:—

"The magnitude of the British task in this great war runs serious risk of being overlooked by reason of exaggerated accounts of successes printed daily in the Press and especially by exhibiting posters framed to catch the eye and magnify comparatively unimportant actions into great victories. Reported reverses to the enemy are proclaimed as crushing defeats, Germany is represented as within measurable distance of starvation, bankruptcy and revolution, and only yesterday a poster was issued in London, declaring that half the Hungarian army had been annihilated.

"All sense of just proportion is thus lost, and, with these daily, and often hourly, statements of great Allied gains and immense enemy losses, the public can have no true appreciation of the facts or of the gigantic task and heavy sacrifices before them.

"The Director appeals to all those who are responsible for the Press to use their influence to bring about a better knowledge of the real situation, and rather to emphasize the efforts that will be necessary before the country can afford to regard the end for which we are striving as anything like assured. The posters, more especially those of the evening papers, are very often preposterous as well as misleading, and, at such a time, those responsible may fairly be asked to exercise a reasonable restraint and help the nation to a just appreciation of the task it has undertaken and the necessity for unremitting effort to secure the only end that can be accepted."

The newspapers did not take this notice "lying down." On March 26 the Newspaper Proprietors' Association, through its chairman Sir George (afterwards Lord) Riddell, sent the following letter to the Press Bureau, and copies to the Prime Minister, Mr. Winston Churchill, Lord Kitchener and other members of the Cabinet:—

"My Council have had under consideration your Memorandum of 12th March, 1915, Serial No. D. 183, for which, in their opinion, there is no adequate justification. The Press has dealt faithfully with the news furnished by the naval and military authorities, but it may well be that the public misunderstand the situation and that this misconception is producing serious results. If, however, the people are being unduly soothed and elated the responsibility lies with the Government and not with the Press. In this connection my Council desire to direct your attention to the optimistic statements of the Prime Minister, Sir John French, 'Eye-Witness,' and other persons possessing official information. The Press acts upon the news supplied. If this is inaccurate or incomplete, the Government cannot blame the newspapers. My Council desire to represent that the methods now being adopted are fraught with grave public danger. Ministers are continually referring to the importance of energy and self-sacrifice on the part of the industrial population, who cannot be expected to display these qualities unless, generally speaking, they are acquainted with the facts. In dealing with the news, the Naval and Military authorities should consider not only our enemies and the army in the field, but the commercial and industrial classes at home, upon whom so much depends. It is futile to endeavour to disregard the long-established habits and customs of the people.

"As you know, I am writing on behalf of the London Press only, but my Council are confident that their views are shared by the provincial newspapers."

The result of this letter was that Mr. Asquith invited the Association to lay their views before him at a deputation. A free exchange of views took place, with the result that Mr. Asquith invited the Press to appoint a representative who would interview Lord Kitchener and Mr. Churchill each week with the object of putting questions to them and receiving private information for circulation to editors. Lord Riddell was detailed for the duty, and had frequent interviews with Lord Kitchener.

As a result of further urgent representations by the Association, represented by Lord Burnham, Lord Northcliffe and Sir George Riddell, the following correspondents were authorized in May 1915—Mr. John Buchan (*Times* and *Daily News*), Mr. Percival Landon (*Daily Telegraph* and *Daily Chronicle*), Mr. (afterwards Sir) Percival Phillips (*Morning Post* and *Daily Express*), Mr. Valentine Williams (*Daily Mail* and *Standard*), Mr. Douglas Williams (*Reuters*). Mr. John Buchan was succeeded by Mr. (afterwards Sir) Perry Robinson, Mr. Percival Landon by Mr. (afterwards Sir) Philip Gibbs, and Mr. Valentine Williams by Mr. (afterwards Sir) Beach Thomas. Mr. Douglas Williams was succeeded by Mr. Lester Lawrence and Mr. (afterwards Sir) Herbert Rundell.

At the beginning, the regulations for the guidance of correspondents were as follows, but for the most part they were allowed to write as they wished.

"Unless officially communicated for publication," the under-mentioned matters were not to be referred to:—

Strength, composition and location of forces.
Movement of troops and operations.
State of supply and transport.
Casualties.
Important orders.
Criticisms and eulogies of a personal nature.
Moral of troops.

Before long, however, the regulations were rigidly enforced, and an attempt was subsequently made to strengthen them. A fresh set of rules was promulgated at G.H.Q. in Nov. 1915. They took this form:—

(1) Current events must not be mentioned in detail until the events have been made public in the commander-in-chief's despatches.

(2) Only general mention of the fighting can be made. Nothing outside the official communiqués is to be touched upon.

(3) Matters of controversial or political interest must be excluded.

(4) Praise or censure is to be left to the commander-in-chief.

(5) Mention of any information by name is prohibited, including such items as the New Army, Territorials, etc., also names of units or individuals.

(6) The articles of war correspondents must be confined to topographical descriptions and generalities.

(7) Detailed information obtained by war correspondents can be used only when permission is given, and the time of publication will vary according to circumstances.

These regulations called forth an angry protest from the Newspaper Proprietors' Association. The War Office denied all knowledge of them and they were withdrawn. The severe restrictions on the liberty of the correspondents led to continual complaints by the Association. Notwithstanding these, no marked improvement took place until July 1917. From that date onwards the stringency of the censorship was gradually relaxed, and the army eventually set up an organization to supply correspondents with information, so that in dealing with the German advance in the spring of 1918 they were able to write with freedom. By the exercise of tact, discretion and inviolable good faith, the correspondents gradually won the confidence of the army, so that towards the end of the war officers of all ranks were keen to have them with their troops and to give them every facility permitted by official regulations. A

great victory was thus achieved and a great service rendered by the correspondents to the country and the Press.

Until Nov. 1917 the censorship was controlled by the Intelligence Department at G.H.Q. At that date it was transferred to a department known as Staff Duties. The difficulties were accentuated by the lack of association between the correspondents and the real head of the censorship at G.H.Q. The man who gave the orders did not censor the "copy," and was not in continuous and direct touch with those who did. The censors worked under great pressure, and the complaints were due chiefly not to their decisions, but to the principles laid down by those in command at G.H.Q. A minor difficulty was due to the necessity for making the despatches correspond with the daily official communiqué—the official account of the day's fighting. Nothing could be said by the correspondents that differed from the communiqués, which usually came out after the despatches had been written. The head of the Intelligence Department until Nov. 1917 was Gen. Charteris. During the whole of the war the chief cause of complaint was the refusal of the authorities to permit the correspondents to identify the units taking part in particular operations, or, in other words, to name the troops engaged. Where the unit was mentioned, neither the date of the event nor the locality in which it occurred was to be specified. The regulations in this respect were meticulous. Even obituary notices were censored. In the later phases of the war the rule was occasionally relaxed, but generally speaking it held until the Armistice.

At other military fronts than France the system adopted was similar, but special difficulties occurred in regard to the despatches from Mesopotamia, which were censored at the Front, in India and at home.

The Naval Censorship.—The navy had its own censorship department at the Admiralty, under the superintendence of Sir Douglas Brownrigg. This department worked partly through the Press Bureau and partly by direct relations with the Press. Generally speaking, the policy adopted was to suppress all information concerning the doings of the navy and allied forces and in particular events of an unfavourable character. Very little information was published concerning the mercantile tonnage sunk by the enemy. There was, however, much to be said for the suppression of these figures, the publication of which would have put fresh heart into the enemy and given them valuable information as to the effect of the submarine campaign. In many instances the German submarine crews were unaware of the effect of their operations.

The Home Front.—A rigid censorship was exercised concerning the publication of information as to the production of munitions, measures of defence, bombardments, air raids, arrests, trials and executions of spies, etc.

Books, Magazines, etc.—These were subject to censorship on the same principles as newspapers. In many cases the authorities refused permission to reproduce matter which had already appeared in American and other publications, whether true or not, the contention being that publication in England would tend to confirm and increase belief in the statements made.

General Comments.—As a method of suppression the censorship during the war may be regarded as having been a complete success. The vast task was well and efficiently done, but the authorities displayed little imagination, and during the first two and a half years failed to realize that the war was a conflict between nations, not armies. They did not fully appreciate that the united effort of all classes was essential to victory, and that such effort could be secured only by telling the people the facts and letting them know that the war was a matter of life or death to the nation (*see* PROPAGANDA). Experience showed that in dark days the country always rose to the occasion. The authorities also failed to appreciate the necessity for telling other peoples, and in particular the Overseas Dominions and America, what Great Britain was doing. When the war commenced the War Office and the army were full of explosive and inaccurate ideas regarding the Press. Lord Wolseley had said that the special correspondent was the curse of the modern army. This spirit pervaded the services during the earlier stages of the war, notwithstanding the voluntary action of the newspapers in suppressing naval and military information in July and Aug. 1914.

Maj.-Gen. Sir C. E. Callwell, who was the head of the Intelligence Department at the War Office when the war started, says in his *Experiences of a Dug-Out* (1920):—"It speedily became apparent that the 'Powers-that-Be' did not mean to be expansive in connexion with incidents where our side was getting the worst of it." He also acknowledges that the Press was badly treated by the War Office and G.H.Q. at the outset and that he was placed in the uncomfortable position of administering a policy which he disliked and which he believed to be entirely mistaken. In short, the Press was regarded with distrust and suspicion. These feelings were gradually removed after constant protests, but not until the war had been in progress for nearly three years was a system evolved which by degrees gave the correspondents a reasonable amount of freedom. The rule prohibiting them, except in rare cases, from describing the achievements of the different units, who were thus robbed of the glory to which they were entitled, had most unfortunate results. The public yearned to know what the soldiers and sailors were doing, and the information was withheld from them. The Australian, Canadian and New Zealand censorships adopted a different system, so that the exploits of these troops were and are well known throughout the world. This led to the circulation of malicious stories to the effect that Great Britain was not doing her share, and that she was preserving her soldiers at the expense of those furnished from overseas. A reference to the terrible weekly casualty lists would at once prove the falsity of this statement. The truth is that so far as the British effort is concerned, the main burden was borne by troops furnished from Great Britain. Owing to the action of the British censorship, this fact is still imperfectly understood in other countries. The effects of the policy of silence were not confined to the war. Great Britain suffers from them permanently. In America and elsewhere the stupendous character of the British performances and sacrifices has been inadequately appreciated because they were not made known at the time. It is doubtful whether the people in Great Britain have fully realized themselves what they accomplished. During the war the Press was engaged in a continuous battle with the departments for more information. It was rarely possible to ascertain who was responsible for the policy of silence. The motives were laudable. What the authorities lacked was vision. The Press fully understood the necessity for secrecy in regard to forthcoming naval and military movements and also in reference to many naval and military operations. But there were other matters which might have been described had the authorities recognized the necessity for giving due publicity to what the nation was doing in the war. As already explained, the policy of secrecy was not confined to naval and military operations. It was only after continued protests by the Newspaper Proprietors' Association that publicity was given to the gigantic achievements of the Ministry of Munitions, and the manufacturers and millions of workers associated with it. Nothing was published about the marvellous working of the railways, one of the most remarkable feats in history. The Admiralty was a great offender. It was stated officially that "the Navy did not wish for publicity." The result was that the wonderful British seamen, including the mercantile marine, mine-sweepers and fishermen, did not receive adequate recognition of their services to the Allies. After continued representations by the newspapers, more publicity was given to their doings in the later stages of the war.

It must, however, be recognized that the censorship bristled with difficulties. It was necessary to prevent the enemy from receiving information; it was necessary to avoid publishing information that would unnecessarily alarm British people or their Allies, or mislead neutrals as to the progress of the war; and it was also necessary for British censors to pay due regard to the censorship policies of other countries with whom Great Britain was associated. The authorities may be excused for their inability in the early days of the war to grasp the essential facts

of the situation, but they laid themselves open to severe criticism for the delay in realizing that a change of policy was necessary.

Callwell, *The Experiences of a Dug-Out* (1920); Sir Douglas Brownrigg, *The Indiscretions of a Naval Censor* (1919). (Rı.)

(2) UNITED STATES.—American Federal legislation in the matter of censorship shows nothing comparable to the British and French Government censorship of newspapers. The Federal Government had no traditions of censorship except the disastrous ones in connexion with the Alien and Sedition laws of 1798. The First Amendment to the Constitution stated that "Congress shall make no law . . . abridging the freedom of speech or of the press. . . ." There had been no sufficient number of cases before 1917 to afford a clear interpretation of this, except that it had been held to be as binding in war as in peace (Milligan case, 71,U.S.2). In the first weeks after the United States had declared war, Congress rejected an amendment to the Espionage Act that would have established a censor's bureau. Recognizing that a war involving the whole nation necessitated full information, the President established a Committee on Public Information on April 14 1917. This agency for publicity concerning war efforts and purposes developed into a great news agency and a means of distribution of patriotic propaganda. Its only direct relation to the control of the press was a request made by it in the name of the Secretaries of State, War and the Navy that newspapers censor themselves in the matter of news that might help the enemy or embarrass the Government. There was no legal force behind this. It was generally observed but with much grumbling and denunciation of the chairman of the Committee, Mr. George Creel, as a "censor."

The adherence of Congress and the President to the traditions of a free press and free speech in simply requesting a voluntary censorship was striking, but it was more in appearance than in reality. It seemed exceptional, for in addition to the usual reasons which justified the other belligerents in instituting official press bureaus and censors to control seditious utterances, the United States faced conditions unknown to them. It was the domicile of about 4,000,000 unnaturalized citizens of the Central Powers—"enemy aliens," to use an old and misleading phrase that was revived. In addition there were millions more born in those lands and using their languages, who had become citizens legally. During two and a half years of neutrality, the free and acrimonious discussion of the war and its issues had filled the Press, and been incessant in every home and community and school as well as in Congressional debates. The propaganda agencies of all the nations, and especially of the Central Powers, had flooded the mails, used the lecture platforms and organized their semi-official press. The country had heard much of the German espionage system, spies were suspected everywhere, and many acts of sabotage, arson, and violence in factories engaged in munition production were ascribed to them. The activities of German agents, some real and many imagined, seemed to call for vigorous action. In other respects, too, the United States departed from its old individualistic tendencies, as in instituting the draft, regulating food, raising huge loans, observing meatless days and sending an army of 2,000,000 to fight in Europe. That wise and necessary restraint did not more often give way to oppression and violence is amazing in a country where the frontier had but recently disappeared.

The fact that no new agency was established to control the Press did not mean that communication, the Press and public speech were to continue to be unrestricted. On April 6 1917, the day war was declared, the radio stations were taken over by the Department of the Navy under the law of 1912. On April 28 the President placed the cables in charge of the same department and the dispatch of messages and use of codes was strictly regulated. On the latter date the telegraph lines were placed in charge of the War Department but transferred later to the Post Office Department when the Government took over the telegraph and express companies. Under the old Internment Statute of 1789, the Attorney-General was authorized by the President to intern dangerous enemy aliens and by an Act of Congress the Alien Property Custodian assumed charge of enemy aliens' property.

So far Federal officials were acting under pre-war legislation including the old Treason law. The earliest war measures aimed at sedition and disloyalty had as a background the passage of the conscription or Selective Service law. It was a great venture in legislation for the United States. The possibility of interference with its enforcement was clearly in mind in the Espionage Act (June 15 1917), which provided that (Section 3, title 1): "Whoever when the United States is at war, shall wilfully make or convey false reports or false statements with intent to interfere with the operation or success of the military or naval forces of the United States or to promote the success of its enemies, and whoever when the United States is at war, shall wilfully cause or attempt to cause insubordination, disloyalty, mutiny, or refusal of duty in the military or naval forces of the United States, or shall wilfully obstruct the recruiting or enlistment service of the United States shall be punished by a fine of not more than $10,000 or imprisonment for not more than 20 years, or both." The last of these clauses was the one oftenest invoked by Federal legal officers. Another section declared non-mailable all written or printed matter which violated any provision of the Espionage Act. This Act was not amended until May 1918 by the Passport and Sabotage Acts and the so-called "Sedition Law." The latter, a loosely drawn statute based on an Act of the state of Montana, sought to suppress all utterances of a disloyal character. It provided punishments up to 20 years' imprisonment for anyone who published "any language intended to bring the form of Government of the United States or the Constitution into contempt, scorn, contumely and disrepute." It opened the possibility for all kinds of complaints and prosecutions by those whose judgment was affected by war hysteria. The Federal Attorney-General, his assistant and the 88 U.S. district attorneys were flooded with silly complaints and beset by unofficial disloyalty hunters and amateur detectives, but kept their heads in most cases remarkably well, as did most of the judges. In the end no prosecutions were permitted until the Attorney-General reviewed the facts and gave authorization. The meaning of this statute was not interpreted by the Supreme Court until 1919, after the fighting was over. Not till then did the courts of first instance have a uniform and controlling indication that the relation between words alleged to be criminal and the armed forces of the nation must be direct enough to constitute "a clear and present danger." Before this, state and Federal courts had taken wide latitude in considering the "general tendency" of utterances. Men had been convicted for criticizing the Red Cross, doubting the utility of knitting socks for soldiers, using abusive and intemperate language in arguments about the war or producing such a motion picture as *The Spirit of '76* which in one part represented British soldiers using bayonets at the Wyoming valley massacre. The obsession that the country was full of German spies persisted until 1918, although Federal officers had broken up German espionage early in the war.

The prosecutions and deportations, especially those instituted by Mr. A. Mitchell Palmer, the new Attorney-General, were subjects of most bitter complaint as the war ended. Federal legislation was supplemented by Acts of even a more drastic character, in most of the states. Many of the state Acts on sedition bear date of 1919, *i.e.* after the close of the war and therefore subject to application and interpretation in fields quite unrelated to the nation's safety during war. In 25 states the display of a red flag was a specified offence. The other source of complaint against Federal activity was the judicially unreviewable power exercised by the Postmaster-General, Mr. Burleson, in closing the mails to journals of which he disapproved. This control was most often exercised by cancelling their classification as second-class matter entitled to low mailing rates. This virtual exclusion from the mails was continued to the financial ruin of some newspapers even though the objection was based on the material in only one issue. Much bitter comment (some of it

partisan) and discontent were aroused by the action of the Postmaster-General.

So far as the foreign language press was concerned there were about 750 newspapers in the 14 chief language groups with whose attitude the Government was chiefly concerned. Most of these regularly published the official news from Washington concerning war activities and purposes. The President was empowered under the Trading with the Enemy Act (Oct. 6 1917), to require that translations of political views and comment touching the United States or any other nation engaged in the war should be filed with the post-office officials at the mailing point in the case of all foreign language publications. Exemption from this rule by special permit was allowed and freely granted. The Post Office Department was designated by executive order as responsible for the enforcement of these measures. In the same Act a very inclusive section gave the President complete power to control any form of communication to be delivered directly or indirectly to any enemy or ally of enemy, or communications of any sort between the United States and any foreign country. By executive order of Oct. 12 the enforcement of this was put in the hands of a Censorship Board composed of the Secretaries of War and the Navy, the Postmaster-General, the chairman of the War Trade Board and the chairman of the Committee on Public Information. This body made the necessary regulations and by Dec. 11 1917 had gathered a large staff at the necessary ports to enforce them. The regulations in no way modified the voluntary censorship exercised by the Press over itself.

About 6,000 out of 4,000,000 "alien enemies" were interned or put under restraint. In all, 1,532 persons were arrested under the Espionage Act.; about 75 more for threats against the President or for sabotage. There were 903 indictments for conspiracy. Acquittals and cases pending reduced the number of those actually convicted under the Espionage Act to about 600. The best-known case was that of Eugene V. Debs, former Socialist candidate for president, who was sentenced to 10 years in a Federal prison for a speech opposing the war and denouncing war as the work of capital. Others were the suppression of *The Masses*, a radical monthly, the cases of Abrams, Goldstein, Kate O'Hare, Berger, Rose Pastor Stokes, and the I.W.W. cases (Haywood and 92 others).

Beyond the realm of Federal action were the state laws, drastic in some cases, and the executive orders of some zealous governors and state defence councils who saw danger in speaking foreign languages in public or over the telephone, or teaching German in the schools, or using certain text-books. There was sometimes a lack of discrimination between the parties essentially loyal, representing agrarian or labour discontent, and those of their leaders whose purposes and sentiments were doubtful. There was also the sort of unofficial censorship, undefined by law but real, which communities exercised against those who had been pro-German or who were now less rea ly than their neighbours thought fitting to subscribe for loans and the Red Cross, and to observe food regulations.

On the whole, however, it is doubtful if all these legal and extra-legal activities in a nation of 100,000,000 were serious enough to justify any general condemnation of war legislation, the courts, and the nation. The quick reaction and sharp criticism of unfortunate acts and decisions indicated that free speech and free press were still basic ideals in the United States.

CEREBRO-SPINAL FEVER (*see* 18.130).—Although serious outbreaks of cerebro-spinal fever had occurred in Belfast in 1907, and in Glasgow and Edinburgh in 1906 and 1907, and although the deaths from cerebro-spinal fever in Scotland in 1907 reached 1,087, yet no considerable outbreak of the disease occurred in England or Wales until the first winter of the World War.

Cerebro-spinal fever had been made compulsorily notifiable in England in 1912, and in that year, in 1913, and in 1914, approximately 300 cases were notified in England and Wales each year.

In 1915 the disease increased more than elevenfold, there being 2,343 civilian and 1,136 military cases. In Feb. 1915 the outbreak indeed assumed very menacing proportions, and in a single week 228 cases were notified. Considerable alarm was aroused as the mortality was exceedingly high, and the serum treatment which had been so successful in the New York and Belfast epidemics appeared at this time to have little effect upon the mortality rate. Special investigations were therefore commenced by the responsible authorities (especially by the army with the assistance of the Medical Research Committee), which were continued during the war, and added greatly to the knowledge of the bacteriology and epidemiology of the disease.

Diminishing somewhat in 1916 the disease broke out with fresh vigour in 1917, military and civil cases being now about equal in numbers.

Aetiologically, there can be little doubt that the outbreak in England which followed the birth of the new armies was principally due to the overcrowding of young recruits in depots, camps, and billets. It is also probable, although this has been warmly controverted, that fresh and highly virulent strains of the meningococcus were brought to England by the Canadian contingents arriving in the late autumn of 1914 after having had several cases of cerebro-spinal fever in their home camps before embarkation and during the voyage east on their crowded transports, and a sharp outbreak on arrival on Salisbury Plain several weeks before British troops were affected. These virulent Canadian strains may have aggravated the outbreak.

At Portsmouth, for example, the disease began on Jan. 15 1915, at Eastney barracks among men who came in contact with a Canadian football team which visited there on Jan. 9, and the first case of the disease at Caterham depot occurred in a man who travelled up from Scotland by night with three Canadian soldiers in the same compartment.

The *aetiology* of cerebro-spinal fever is peculiarly instructive from the fact that, in at least 95% of all cases, the disease results not from infection derived from another patient suffering from the disease but from infection derived from an apparently healthy carrier, that is a person who harbours the meningococcus in his nasopharyngeal secretion without contracting the disease, and who is usually unaware of having ever been in contact with a patient suffering from the disease. Infection is most often transmitted in sleeping quarters.

Carriers are of two kinds: temporary carriers who harbour the meningococcus for only two or three weeks and who then become free spontaneously; and chronic carriers who harbour the germ for many months and even years.

Cleminson has shown that almost all chronic carriers have marked nasopharyngeal defects, the commonest type being that in which there is an obstinate mucous contact between a deflected and thickened nasal septum and the middle turbinate.

Chronic carriers are responsible for carrying on the disease from epidemic to epidemic and also for the sporadic cases which occur between epidemic times. Recovered patients are often chronic carriers, the meningococcus having been recovered after two years from the nasopharyngeal secretion in several instances.

In ordinary times the population probably contains some 2% of carriers, but at the height of an epidemic in a crowded community, such as that on a ship or in a crowded depot, the carrier-rate may rise to 75%, the vast majority of the carriers being temporary.

At the outbreak of war the necessity for rapidly raising enormous forces at once led to very serious overcrowding of the available barracks and depots, and the hastily erected camps and hutments were overcrowded as soon as they were erected. Military necessity was urgent and imperative.

In Jan. 1915, all the known requisite factors for an outbreak of cerebro-spinal fever were present: severe overcrowding, cold weather, and a population rendered susceptible by youth, by the fatigue of rapid training, by nostalgia, and by entry into a new method of life.

Recruits have always shared with infants a peculiar susceptibility to cerebro-spinal fever The armies in the field despite far greater hardship suffered much less than the recruits training at home. The incidence of cerebro-spinal fever in the U. S. training camps following their entry into the war was 45 times as great as that in corresponding male age groups in civil life.

Overcrowding has at least a threefold importance as a factor in the production of cerebro-spinal fever epidemics:—

First, the atmosphere of an overcrowded and ill-ventilated room or hut, by lowering the individual resistance, tends to favour the

chances of the meningococcus attacking the meninges with success. Secondly, by shortening the distance between man and man, overcrowding facilitates the transmission of infections of the upper respiratory passages, since these are present in droplets of secretion which are liable to be sprayed out into the surrounding air, in the acts of coughing, sneezing and loud speaking. For this reason, overcrowding favours the occurrence of catarrhal diseases, which so frequently precede and accompany an outbreak of cerebro-spinal fever. Thirdly, for a similar reason, overcrowding tends to produce a high carrier-rate of the meningococcus in a community; thus ensuring to any susceptible individual, freshly introduced, a massive dosage of the organism.

In addition, the rapid transmission from one temporary carrier to another which a high carrier-rate implies may very probably tend to increase the virulence of a strain of meningococcus previously of low virulence.

Glover's work on carrier-rates demonstrated that the meningococcus carrier-rate is a direct index of the degree of overcrowding, and that, when this overcrowding is remedied by increasing the distance between the beds, a high carrier-rate rapidly falls to a normal rate. There is a sharp rise in the carrier-rate of a community before an epidemic, that is to say, a "carrier epidemic" precedes and accompanies the "case epidemic." For practical purposes, a carrier-rate of 20 % has been regarded as the danger line.

Cerebro-spinal fever is an acute infectious disease, due to the *meningococcus*. It occurs sporadically and in epidemics, and has usually as its chief manifestation an acute meningitis affecting both brain and spinal cord. The causal organism is undoubtedly the diplococcus intracellularis of Weichselbaum, a gram-negative coccus of characteristic kidney shape, almost invariably seen in pairs, and having no well-defined capsule. In the body fluids, and especially in the cerebro-spinal fluid, it is usually seen inside a polymorphonuclear white corpuscle. Often, however, the diplococcus is seen to be extracellular. Prognosis in a case is usually considered to be better when a slide of the cerebro-spinal fluid shows the majority of the diplococci intracellular rather than extracellular.

The meningococcus stains well, and is invariably gram-negative. An excellent culture medium is Gordon's trypagar enriched for primary culture with a solution of laked rabbit blood or fresh human blood. The optimum temperature is 37° C. The meningococcus ferments glucose and maltose, but not levulose or saccharose. Whilst it can be distinguished from other gram-negative diplococci by cultural tests, the best criterion for identification is serological, that is by agglutination tests with the sera of animals, immunized by repeated injections of killed meningococci obtained by culture from the cerebro-spinal fluid of patients suffering from the disease.

By the use of this method of agglutination and the allied method of absorption, Gordon divided the meningococci found in military cases of the disease in 1915 into four types. Dopter had previously differentiated two types, which he termed meningococcus and parameningococcus respectively, and the first two types of Gordon, which together account for 80 % of the cases, correspond to Dopter's groups, Gordon's type 1 being Dopter's meningococcus and his type 2 Dopter's parameningococcus. Gordon's type 3, which is more closely allied to type 1 than to type 2, gave rise to some 15 % of the cases, whilst Gordon's type 4 was of rare occurrence except in one outbreak at Chatham.

A patient suffering from cerebro-spinal fever harbours only a single type of meningococcus in his cerebro-spinal fluid and it is almost invariably present in his nasopharyngeal secretion.

Determination of the type of the invading meningococcus is of great practical importance, as the serum of an animal immunized against one type has little or no therapeutic or protective value in a patient suffering from an invasion of a different type of meningococcus. A therapeutic serum must therefore either be polyvalent or if monovalent, be used only for its appropriate type when the type has been determined. For general use a polyvalent serum has the merit of simplicity and with potent serum the results are extraordinarily good.

Tullock has shown that type 2 is a complex type divisible into three sub-groups, and the much greater difficulty in producing a good anti-type 2 serum is probably owing to this fact.

Criticism of Gordon's types has concentrated mainly on his types 3 and 4, but there can be no doubt that Gordon's types were of the utmost value for the epidemic of 1915–8. In a series of 526 strains of meningococci from the cerebro-spinal fluid of patients, 98 % were identifiable with one or other of the four types, and one-fifth belonged to types 3 and 4.

Infection of the nasopharynx probably always takes place first. In most cases a blood infection appears to precede the meningeal invasion, but the actual channel of infection between the nasopharyngeal secretion and the meninges is uncertain; it may be either through the blood stream, or by the sheaths of the olfactory nerves passing through the cribriform portion of the ethmoid, or by the sphenoidal sinuses.

The *incubation period* is usually three to four days. The *onset* is sudden and contrasts with the usually more gradual onset of tuberculous meningitis. In no disease is *early diagnosis* of more urgent importance. Intense headache, vomiting, a moderate degree of pyrexia with a comparatively slow pulse, stiffness of the muscles of the neck and a positive Kernig's sign are the primary symptoms. The disease is usually well defined; these five symptoms being all present in 85 % of cases, and only some 10 % of cases are atypical, the most common deviation being a long initial pyrexia.

If there be any suspicion of the disease lumbar puncture should be performed at the earliest possible opportunity for the purposes of both diagnosis and treatment. Retraction of the head is a later symptom and should never be waited for.

The characteristic "spotted" rash is present in a percentage of cases, which varies considerably in different epidemics. Rashes appear more constant in American experience. In 1917 in London it was present in about 25 % of patients; it is a macular rash appearing first on the skin and the dorsum of the foot, then upon pressure points, elbows, buttocks and back. Large purpuric patches are characteristic of fulminating cases, which form about 5 % of the cases. Petechial maculae, erythema, rose spots, and blotches often occur in cases of ordinary severity.

Labial herpes is a later symptom than the rashes, and is of favourable import. Inequality of the pupils is less common than in tuberculous meningitis. Squint is seen in a smaller proportion of cases (6 %) than in tuberculous meningitis. Hemiplegia, usually transient, and nerve deafness, usually permanent, each occur in about 5 % of cases. Albuminuria is common, but usually transient; haematuria occurs in a small proportion, and, to a less extent, glycosuria. Constipation is almost invariable and with the incessant vomiting may lead to the diagnosis of an acute abdominal condition.

In children the disease is often ushered in by convulsions. Retraction occurs at an earlier stage than in adults. Persistent tetany of hands and feet is common and rapid emaciation occurs.

Three main *clinical types* of the disease are described, fulminant, severe and atypical. A fulminant case is one in which the initial systemic invasion results in so profound a toxaemia that the death or early collapse of the patient may obscure the meningeal condition. Death may take place in a few hours after onset. Fulminant cases amount to some 5 % and are more common at the height of an epidemic. Typical severe cases form some 85 % of all cases and in them cerebro-spinal fever forms as clear a clinical feature as does any disease. Atypical cases form some 10 % and the most usual form is one with a long preliminary pyrexia which may be diagnosed as enteric or trench fever. Ambulant or slight attacks do not occur.

The essentials of the *treatment* of cerebro-spinal fever are three:—

First, early and repeated relief of pressure by lumbar puncture; this procedure alone will considerably reduce the case mortality rate in adults. Secondly, the early and repeated intrathecal administration of a potent antimeningococcal serum (intravenous administration may also be beneficial if the systemic invasion be marked). Thirdly, the relief of pain.

Serum treatment depends for its success upon early administration, upon sufficient dosage and upon the therapeutic potency of the serum itself. The serum treatment of cerebro-spinal fever was introduced by Flexner and Jobling in the New York epidemic of 1905 with great success, and reduced the "untreated case" death-rate of over 70 % to a "treated case" death-rate of under 20 % in those patients who received serum in the first week of illness.

Unfortunately, at the beginning of the 1915 epidemic in England the only serum available proved very disappointing. It had been made from laboratory strains from previous epidemics, and had very little therapeutic effect. Subsequently it was found to fail to agglutinate types 1 and 2 at a dilution of 1 in 50. Following the collection of fresh strains from the current epidemic by Arkwright, Gordon, and others, however, a very potent serum was produced from them by McConkey at the Lister Institute in 1916, which again fully vindicated the value of serum treatment, reducing the mortality rate in cases where it was used in the first week to 14 %. Gordon has shown that the therapeutic value of serum appears to depend chiefly upon its capacity of neutralizing the toxin of the meningococcus. There is great variation in therapeutic value even in batches produced by the same laboratory, although Gordon's modification of Besredka's method for determining anti-endotoxic content promises well as a method whereby a standardization of anti-meningococcal serum could be reached.

Owing to the complex character of type 2, it is harder to produce a serum satisfactory for all cases infected with this type than to produce potent serum for the other types. The monovalent type 1 serum produced by Griffith for the Medical Research Committee was extraordinarily effective for type 1 cases, but his type 2 serum was much less efficacious for type 2 cases.

Lumbar puncture, preferably under an anaesthetic, should be done at the earliest possible occasion. As much cerebro-spinal fluid, usually about 60 c.c., as will flow should be allowed to run from the needle into sterilized test tubes for culture and examination, until the fluid comes one drop at a time with each respiration. If the cerebro-spinal fluid be cloudy or purulent, 30 c.c. of serum warmed to blood-heat is then run in through the needle by gravitation with a rubber tube. The foot of the bed is raised after administration.

This procedure is repeated at intervals of 24 hours until four doses have been given, which are usually sufficient with a potent serum. The cerebro-spinal fluid becomes clear and free from meningococci. Often two or three doses are sufficient. It is often wise to conclude the series with a lumbar puncture without the use of serum for the relief of pressure only. Curative vaccines have been used in prolonged cases, where serum appears to be losing its effect. An autogenous sensitized vaccine should be used.

Another method of treatment used in cases where the patient does not react well to the curative horse serum, or where no curative serum is available, is to inject intrathecally 30 to 50 c.c. of the patient's own serum, separated under strictly aseptic conditions from blood drawn from his basilic vein.

This procedure, based upon the fact that anti-bodies are developed in greater extent in the blood than in the cerebro-spinal fluid, has in some instances appeared to do much good.

Serum sickness on the 8th to the 10th day is often observed, but is not usually serious. Anaphalaxis is very occasionally seen. It is more liable to occur with intravenous than with intrathecal injection. The principal complications met with are pneumonia, the supervention of a pneumococcal meningitis, arthritis, cystitis due to the meningococcus, hydrocephalus, panophthalmitis.

In patients who recover, complete nerve deafness is the most common (3 to 5 %) of the serious *sequelae*. Permanent mental change is unusual. A prolonged convalescence is essential.

The *chief post-mortem findings* in the majority of fatal cases are confined to the central and nervous system. Their macroscopic appearance is similar to those found in cases of other forms of meningitis. Fulminant cases may show little save injection of the dura mater, a lustreless arachnoid, a soft and swollen appearance of the brain together with a pink congestion of the pia mater. The cerebro-spinal fluid may only be slightly turbid in these fulminant cases.

The ordinary acute case shows a thick yellow purulent exudate mostly at the base of the brain extending along the main fissures, and down the cord. The bulb and the posterior surface of the cord are usually covered with marked accumulations of the exudate. Flaky and turbid fluid is found in the distended ventricles.

In chronic cases there is marked hydrocephalus. The convolutions are pale and flattened; localized adhesions and thickenings are marked between the membranes, thus forming pockets in the cranium and theca. The various foramina, particularly that of Majendie, may be obliterated, interfering with the circulation of the cerebro-spinal fluid. Marked emaciation is usual.

The post-mortem appearances in other organs are not usually striking. Embleton has shown the frequency of empyema of the sphenoidal sinus. A broncho-pneumonia is almost invariable. Purpuric and other haemorrhages are common in many organs, and have been especially described by some observers in the suprarenal capsules in fulminant cases. Arthritis, orchitis and pericarditis are described and a meningococcal cystitis may be found.

The chief point in the *prophylaxis* against cerebro-spinal fever is, of course, the prevention of overcrowding; this is of paramount importance. Ventilation and distance between the beds in sleeping quarters are of much greater importance than mere floor or cubic space. "Wall space" is essential.

The early isolation of cases of catarrhal disease is of great importance in preventing the increase in the carrier-rate for the reason that a carrier with a catarrhal sneeze or a cough will spray the meningococcus in a much more effective manner than the same carrier without a catarrh. As a rule the meningococcus itself does not give rise to catarrhal symptoms in the carrier.

Where overcrowding is unavoidable and spacing-out impracticable, steam spray treatment, using a 2 % solution of zinc sulphate, may be given for 10 minutes daily to the overcrowded community. In several instances this procedure appeared to check the incidence of cases during an actual outbreak of cerebro-spinal fever. This method of treatment should, however, never be used as a substitute for spacing-out and improved ventilation.

Prophylactic vaccination cannot be regarded as having been proved to afford protection, though at Salisbury and at Camp Funston it appeared to give promising results. (J. A. G.)

CEYLON (*see* 5.778).—The pop. had increased from 3,578,333 in 1901 to 4,110,637 in 1911 and was estimated at 4,757,598 on Dec 31 1919, giving a density of 187 per sq. mile. The proportions according to race, per 1,000 of the total pop., were:—Europeans 1·5, Burghers 6·2, Sinhalese 628·3, Tamils 200·4, Moors 58·2, Malays 3, others 3·4. European residents numbered 7,349 in 1910. The death-rate was 35·6 per 1,000 in 1919—the highest yet recorded—and was mainly attributable to the influenza epidemic and an outbreak of cholera. The urban pop. represented about 13% of the total, the chief towns being: Colombo, pop. (1911) 211,274, Jaffna 40,441, Galle 30,960 and Kandy 29,451. Both immigration and emigration figures showed a general decrease—from 120,334 and 90,374 respectively in 1911 to 47,296 and 32,119 in 1917.

It is estimated that 2,182 Ceylon men (Europeans 1,573, and Sinhalese 609) joined the army during the World War and a further 1,204 were recruited for service as clerks and mechanics. The "Ceylon Sanitary Company," raised in 1917, rendered conspicuously valuable service in Mesopotamia.

The Constitution.—Under the constitution embodied in the Letters Patent of 1910, Ceylon was administered by a governor aided by an executive council of seven members, including the officer commanding, the colonial secretary, attorney-general, controller of revenue, colonial treasurer, Government agent of the western province, and one member nominated by the governor; and a Legislative Council of 21, including the 7 members of the executive, 4 other official, and 10 unofficial members, of whom 6 were nominees of the governor and 4 elected to represent separate communities.

On Oct. 1 1920, with a view to giving a larger measure of popular control over administration, changes in the constitution which had been for some time under consideration received the approval of the King. The provisions were as follows:—

As regards the executive council, the governor is instructed to appoint an additional three unofficial members; and, as to the Legislative Council, the modifications will (1) involve a considerable extension of the principle of popular election and (2) give the unofficial members a substantial majority over the official vote.

The reformed Legislative Council will number 37 members (exclusive of the governor who will preside), viz., 14 official and 23 unofficial members. Of the unofficial members, 16 in the first place and, as soon as arrangements can be made 19, will be elected by various constituencies—11 on a territorial basis (the franchise and qualifications for candidates following the proposals of the Ceylon National Congress), two to represent the European community, one the Burgher community, one the Chamber of Commerce, one the Low Country Products Association, and (until the registers for the Kandyan and Indian communities can be undertaken) two members will be nominated to represent these communities. Of the remaining four members, one member will be nominated (as before) to represent the Mohammedan community—it being thought impossible owing to the wide distribution of Mohammedans in the island to introduce any system of election for this community—and the governor will have power to appoint not more than three unofficial members to represent interests inadequately provided for.

By this arrangement, the unofficial members of the Legislative Council will be in a majority of nine over the official, but the governor will have both an original and a casting vote if he should choose to exercise it, and, in order to prevent a deadlock, it is provided that he may declare the passing of any measure to be of paramount importance to the public interest and, in such case, the measure may be carried by the votes of the official members. Somewhat similar reserve powers are contained in the Government of India Act.

The reforms have been opposed by certain sections and, in Oct. 1920, the Ceylon National Congress unanimously resolved to boycott the scheme as "utterly inadequate and reactionary."

For purposes of general administration, Ceylon is divided into nine provinces, presided over by Government agents. There are 3 municipalities and 21 local government boards. A Local Government bill, providing for a wide extension of the principle of local government was under consideration in 1921.

Education.—A new ordinance, constituting a Board of Education, which came into force in 1919, enacts that new regulations must be laid before the Legislative Council for disallowance or amendment before being confirmed by the governor in executive council. The board consists of not less than 16, or more than 20, members nominated by the governor, of whom the director and assistant director are *ex officio* members while the others hold office for three years. In 1919 there were 884 Government vernacular schools, with an attendance of 97,819 boys and 32,570 girls; 1,855 Government aided schools, with 129,027 boys and 78,649 girls; 256 aided estate schools, with 9,061 boys and 1,247 girls; and 265 English and Anglo-vernacular schools attended by 36,526 boys and 10,462 girls—a total of just under 400,000. The total sum expended by Government on vernacular education in 1919 was Rs. 1,434,264 of which approximately two fifths were spent on Government and three-fifths on aided schools. The total number of pupils attending secondary schools was 8,065 in 1919. The Government training college (1919) had 39 men and 41 women in training in the English side, 8 men in the Anglo-vernacular, and 40 men and 40 women in the Sinhalese. A scheme was on foot in 1919 for affiliating Ceylon University College to Oxford University. The building of a new Royal College was begun in 1920.

Police.—The strength of the force on Dec. 31 1919 was 2,884 of all ranks. Statistics show an apparent increase of crime: there were 7,581 convictions in 1917, 8,328 in 1918, and 8,577 in 1919, the largest number of convictions in each year being for burglary.

Revenue and Expenditure during the five years 1915–9—the financial year ending Sept. 30—were as follows:—

	Revenue	Expenditure
1915	Rs. 51,545,475	Rs. 50,148,000
1916	66,013,005	56,104,515
1917	66,981,870	64,335,675
1918	63,933,628	64,944,549
1919	70,070,941	70,843,681

The principal sources of revenue in 1918 were: customs, Rs. 19,857,255; railways, 16,702,050; spirit licenses, 8,991,795; stamps, 5,732,985; port and harbour dues, 2,218,155; the salt monopoly; and sales of crown lands. Items of expenditure: railways, Rs. 12,746,895; public works, 8,218,935; interest and sinking fund on loans, 5,391,495; military, 4 668,060; medical department, 4,061,130; post and telegraphs, 2,878,440, education, 2,580,930. The area of crown lands sold decreased from 32,832 ac. in 1913, to 6,019 ac. in 1918, but rose to 6,456 ac. in 1919 in which year the system of outright sale, instead of leasing in perpetuity, was reverted to.

Public Debt.—At the close of the financial year 1919, the public debt stood at £5,142,268, or approximately one and one-tenth times the annual revenue.

Currency.—On Sept. 30 1919 the value of currency notes in circulation was Rs. 40,533,042. The Ceylon Savings Bank had a sum of Rs. 4,089,722 to the credit of 39,706 depositors on Dec. 31 1919, as against Rs. 5,152,980 and 37,099 depositors in 1911.

Agriculture.—It is estimated that about 3,000,000 ac. are under cultivation and 1,000,000 ac. under pasture. In 1918, coconut and other palms occupied approximately 1,226,000 acres, paddy 679,000, tea 506,000 and rubber 281,000. Livestock, in 1917, comprised 3,986 horses, 1,577,464 cattle, 86,103 sheep and 62,721 pigs. In 1919–20 considerable further areas were brought under paddy and dry grains in order to meet the serious shortage in the locally grown food supply then prevailing, while the area under rubber was reduced on account of the depression in the rubber market. Coffee, once a leading product, has practically disappeared from the list of exports. A decision to restrict, in 1920 and onwards, the production of tea by 20% was come to owing to the glut in the home market.

Other Industries.—Sub-committees were engaged in 1920 in investigating the possibility of establishing paper and glass manufactures for which the raw materials are available in great quantity; and the development of the fisheries of Ceylon (at present in a very primitive state) was still being studied in 1921. The Public Works Department continued to investigate the question of hydro-electric production for the supply of electricity to industries and railways.

Communications.—The total mileage of railways was 728 in 1919, as against 712 in the previous year. The extension of the main up-country line by 21 m. to Badulla, the principal centre of the Uva province, was undertaken in 1920. The total length of roads was 4,086 m. of which 267 m. were mere bridle-tracks. At the end of 1919, there were 550 post-offices (including 160 telegraph) as compared with 444 in 1911.

Trade.—The following table shows the value (in Rs. 1,000) in 1919 as compared with 1911:—

	Imports	Exports	Total
1911	156,986	180,527	337,513
1919	239,324	367,055	606,379

The staple exports (values in lakhs of rupees) in 1919 were: rubber 1,321, tea 1,165, copra 323, coconut oil 257, desiccated coconut 249, and cinnamon 37. Of exports in 1919 the United Kingdom took 42·1%, United States 33·5, British India 6·8; and of imports British India sent 30·4%, Burma 23·9 and United Kingdom 14·2.

The following table gives in round numbers the exports of rubber and tea during the period 1916–9:—

	Rubber cwt.	Tea lb.
1916	487,000	203,000,000
1917	646,000	195,000,000
1918	413,000	180,000,000
1919	900,000	208,000,000

Shipping.—During 1919, 4,130 vessels (including 1,018 sailing craft) with a total tonnage of 9,988,176 (tonnage of sailing craft 103,413) entered the several ports of Ceylon. The distribution according to nationality was: British 6,467,584 tons, Japanese 1,054,331, French 317,776, Dutch 272,573, United States 87,499. The total tonnage entering Colombo amounted to 8,603,643.

CHAFFEE, ADNA ROMANZA (1842–1914), American soldier (*see* 5.800), died in Los Angeles, Cal., Nov. 1 1914.

CHAMBERLAIN, JOSEPH (1836–1914), British statesman, died at Highbury, Birmingham, July 2 1914. From 1910 onwards, as for the three or four years previously, after he had been struck down by illness in 1906, Mr. Chamberlain remained in the political background, personally crippled, but intellectually an abiding source of strength to his old political followers, who continued to cherish his inspiration and to work for his ideals in the development of a united British Empire. Since they were now in opposition, the cause of tariff reform and imperial preference was no longer one of practical politics, and after the outbreak of the World War the conditions which had produced this active movement in 1903 were substantially altered. Nevertheless, it fell to Mr. Chamberlain's son, Austen Chamberlain, as Chancellor of the Exchequer in 1919, after his father's death, to include imperial preference in the budget of that year, and thus to carry this part of his programme to victory.

In 1916 Mr. Chamberlain's widow married Canon W. H. Carnegie, rector of St. Margaret's, Westminster, and chaplain to the House of Commons.

CHAMBERLAIN, (Joseph) AUSTEN (1863–), English statesman, eldest son of Joseph Chamberlain (*see* 5.817) by his first wife, Harriet Kenrick, was born at Birmingham on Oct. 10 1863. He proceeded from school at Rugby to Trinity College, Cambridge, his father having determined to secure for the eldest son, whom he destined for politics, those academic advantages which early entrance on a business career had denied to himself when a young man. After a good degree at Cambridge and a useful apprenticeship in speaking at the Union, Austen Chamberlain completed his studies at the École des Sciences in Paris, and at the university in Berlin, where he attended the lectures of Treitschke. But valuable as this training was for the profession of politics, it was secondary to the advantages of daily contact with living issues which he enjoyed by growing up beneath the roof of perhaps the most compelling political personality of the day. He entered the House of Commons at a by-election in E. Worcestershire in 1892. He was returned again at the General Election in July, and in the following year, as junior Liberal Unionist Whip, he was to witness the slow slaughter of the Second Home Rule Bill after nearly 90 days' debate, in which Joseph Chamberlain was the protagonist. When Joseph Chamberlain became in 1895 Colonial Secretary under Lord Salisbury, his son became Civil Lord of the Admiralty. For five years, until 1900, Austen Chamberlain held this office, with Lord Goschen as First Lord; and although he was not called upon to speak often in the House, he succeeded in impressing his chief, and the permanent officials, with the integrity of his character and his solid grasp of mind. Wearing a single eye-glass like his father, and resembling him otherwise outwardly, critics would look for deeper resemblances too. But "Joe's" genius was his own; and Austen's strong gifts came to be recognized as none the less remarkable because they chanced to differ widely from his father's. The S. African War was virtually over when in Oct. 1900 the "Khaki" General Election took place; and upon Lord Salisbury's return to power Austen Chamberlain became Financial Secretary to the Treasury, with Hicks-Beach as Chancellor of the Exchequer. War finance explained the increased burdens of that year, and the 2d. rise in the Income Tax of the budget of 1901. But the most significant financial change appeared in the budget of 1902, when the 1s. a quarter duty upon imported corn was revived.

In the following summer Lord Salisbury resigned, and in the reconstruction following Mr. Balfour's accession to the post of Prime Minister, Austen Chamberlain entered the Cabinet for the first time as Postmaster-General. Peace in S. Africa had been declared; a season of reconstruction had now set in; and Joseph Chamberlain took advantage of the lull to visit the S. African colonies, so recently won and secured. It was on his return in 1903, only to find that a majority of the Cabinet had been converted in his absence to a remission of the tax on corn, which had been destined by him and his son as a weapon, however elementary, for forging Imperial unity—for by reducing it upon corn from the Colonies they had hoped to inaugurate a fiscal preference with the Dominions overseas—that the Tariff Reform movement was initiated by Joseph Chamberlain, with the result that in Sept., after launching the Tariff Reform League in the summer, he resigned from the Government. His son, however, joined the Cabinet as Chancellor of the Exchequer, technically a higher office than his father had ever held.

Although the Tariff Reform controversy raged throughout 1904, only faint fiscal ripples disturbed the new Chancellor's budgets of 1904 and 1905, which remained mainly orthodox. But the split in the Government and the party upon this paramount issue, together with other political causes (*see* 3.254), led to their crushing defeat in the election of Jan. 1906. Austen Chamberlain was again returned to Parliament. Subsequently in this year he married Ivy Dundas, by whom he had a family of two sons and one daughter. The Unionists had dwindled to 158, against 512 Ministerialists under Campbell-Bannerman, in the new Parliament, and the task of this disheartened residue was formidable. Austen Chamberlain, however, encouraged them, not only by his industrious activity, especially among the younger Tariff Reformers, in assisting the propaganda work, but in the House of Commons by his spirited assault upon the budget of 1906, as well as by his bold denunciation of Mr. Asquith's high taxation in the budget of 1907. In the year following, Mr. Asquith succeeded Campbell-Bannerman as Prime Minister, and his introduction of old-age pensions somewhat disarmed the critics of his finance. In 1909, however, Austen Chamberlain led the opposition against Mr. Lloyd George's "People's Budget." In a brilliant impromptu speech he moved its rejection, arguing that the Government was welding a weapon for oppressive taxation; and for 40 days in committee he fought it clause by clause and line by line, until the proposed diversion of the old Sinking Fund was dropped, the duty on ungotten minerals had to be jettisoned, and the land taxes were whittled down into weapons of such weak revenue-raising capacity that they finally vanished (with Mr. Lloyd George's assent) in his own budgets of 1919 and 1920. In the period of constitutional crisis which followed the Lords' rejection of the budget, and after the breakdown of his father's health, he consolidated his own position in the Unionist party as the leader of the Tariff Reform movement in his father's absence; and when Mr. Balfour resigned the leadership of the Unionist party in 1911 he had established strong claims to the succession. But another section favoured Mr. Walter Long, his senior, and it was characteristic of both men that they would not put the party to any division in the matter. Austen Chamberlain gave his full loyalty to Mr. Bonar Law when he was unanimously adopted.

In 1913 he became chairman of the Royal Commission on Indian finance and currency, acting until March 1914. When the World War broke out, it had not proceeded long before a Coalition Government became necessary, and he then joined the Government as Secretary of State for India. In this capacity he inherited extensive military commitments in India and the conduct of a campaign in Mesopotamia, over which distance gave him spasmodic and scant control. When difficulties overcame the expedition in its advance upon Bagdad, a commission was appointed to inquire into the causes in Aug. 1916. It reported in June 1917, and, since it reflected upon the medical preparations in India, a debate followed in the House on July 11. To the general astonishment Mr. Chamberlain in his speech announced his resignation, admitting the truth of the breakdown of the hospital arrangements, but explaining that he was entirely ignorant of it until the damage had occurred. Although the Prime Minister urged him to remain, he insisted upon the constitutional duty of a responsible minister to resign when his office had been censured, and in doing so he confirmed his reputation for disinterested and high-minded independence.

In 1918 he returned to office in Mr. Lloyd George's Coalition Government, as minister without portfolio. At the general election in Dec. he was returned unopposed for W. Birmingham, for which, on his father's death in 1914, he had been returned at a by-election, and he was then appointed, at Mr. Lloyd George's invitation, once more Chancellor of the Exchequer. The Peace was being negotiated in the early months of 1919 in Paris, but Mr. Chamberlain's valuable contribution to the deliberations there of the Supreme Economic Council, over which he presided, did not prevent the introduction by him of the budget on the last day of April, in a speech reflecting the gigantic pecuniary sacrifices of the nation and the urgent need for economy. Taxation was increased to meet an expected deficit; but the distinctive departure of the budget was the reduction of existing duties by one-sixth upon articles of general consumption from the Colonies. The principle of Imperial Preference thereby became an integral element of the British financial system; and by a strange stroke of fate it was thus first introduced by the son of the statesman who had sacrificed everything to preach this principle and convert his countrymen 15 years before. A little later in the year, although private pockets were empty and the spirit of sacrifice temporarily exhausted, Mr. Chamberlain issued the Victory Loan. In the budget of 1920 he had the titanic task of attempting to make revenue and expenditure balance, with a deadweight debt of £7,835,000,000 and a floating debt of £1,312,-000,000. But not content with £150,000,000 in hand for debt reduction, Mr. Chamberlain called upon the nation for further efforts and increased the excess profits duty to 60%, while introducing a corporation tax for the first time. When he had taken office as Chancellor late in 1918 the budget could not be balanced without borrowing, and currency inflation continued. But in this, his second year, the budget balanced, over £250,000-000 of debt was repaid out of revenue, and inflation took a downward course. This was done when trade prospects were favourable, and before it could be realized that wide economic dislocation on the Continent, aggravated by home labour disputes, was about to create a profound commercial depression. Criticism was, however, not wanting in later months that a less drastic policy of debt reduction would have left citizens better able to finance business, and as the year went on some concessions had to be made to this view, with which was combined a growing agitation for economy so as to reduce expenditure. The withdrawal of the excess profits duty next year was announced in Nov. in advance of the budget statement for 1921, and Treasury control was everywhere tightened.

On March 17 1921 the political world was startled by Mr. Bonar Law's resignation of the Unionist leadership, owing to ill-health. Instinctively the party turned for a successor to the man who might have led them 10 years previously, and whose accumulated experience and services were now his overwhelming credentials. There were no competitors to Mr. Chamberlain's candidature; even the usual lobbying seemed absent; and on March 21, in a packed party gathering at the Carlton Club, he was unanimously chosen Leader of the party. As such he became Leader of the House of Commons, and took office as Lord Privy Seal, being succeeded as Chancellor of the Exchequer by Sir Robert Horne. (O. L. L.)

CHAMBERLAIN, JOSHUA LAWRENCE (1828–1914), American soldier (*see* 5.810), died at Brunswick, Me., Feb. 24 1914.

CHAMBERS, CHARLES HADDON (1860–1921), British playwright, was born of Irish parents at Stanmore, near Sydney, N.S.W., April 22 1860. As a boy of 15 he entered the N.S.W. civil service, but two years later sought a more adventurous life as a stock-rider in the Australian bush. In 1880 he first visited England, and two years later established himself there as a journalist, writer of stories, and finally as a playwright. Amongst his most successful plays (*see* 8.534, 536) may be mentioned *Captain Swift* (1888); *The Idler* (1890); *John-a-Dreams* (1894); *The Tyranny of Tears* (1899); *The Awakening* (1901) and *Passers-By* (1911). He died in London March 28 1921.

CHAMPAGNE, BATTLES IN, 1914–8.—At the end of the fighting after the battle of the Marne, the lines became stable along a front selected by neither of the opposing forces. On the sector W. of the Chemin des Dames, along the heights of Vailly Chavonne-Soupir-Moussy, the 69th French Div. had relieved British divisions, and its front line was, so to speak, hanging on to the slopes which dominate the Aisne, with the river in its rear, and with all its communications under observation of the Germans, who were holding the fort of Condé.

I. Combats of 1914–5 on the Soissons-Reims Front

Vailly-Soupir, Oct. 30–Nov. 2 1914.—On Oct. 29 the trenches occupied by the French 69th Reserve Div. were strongly bombarded on the plateau of Rouge-Maison; on Oct. 30 the 137th

Brigade was attacked with great violence; on account of the extent of its front it had no reserves and was compelled to retreat at 9 A.M. on the bridges of Vailly and Chavonne and to consolidate S. of the Aisne. On Nov. 1 the German patrols, which had pushed forward on the left bank, were driven off. On Nov. 2, however, at 8 A.M., after a violent bombardment the 138th Brigade was attacked in its turn and ceded one to two km. of ground, stopping the enemy advance in front of Soupir and Moussy. The 69th Reserve Div. suffered heavy losses: 78 officers and 3,800 men. This division was relieved by the I. Deligny Corps, which, during Nov. 6–12, failed to retake the lost ground.

The Engagement of Crouy.—On the heights of Soissons-Missy-sur-Aisne the French position was rushed forward too far to the N. of the Aisne. The 5th group of reserve divisions, which occupied this position, had even been compelled to leave the greater part of its artillery on the south bank, whence it was unable to support the infantry effectively. Fearing a repetition of the defeat suffered at Vailly by the 69th Reserve Div., Gen. Maunoury, commanding the VI. Army, decided to improve his position —a position which only hung on to the edges of the plateau which overlooked the Aisne. On his instructions Gen. Berthelot, who had just taken over command of the 5th group of reserve divisions, on Dec. 7, worked out a plan of attack on the Plateau 132, which dominates Crouy, with the object of debouching later on towards Terny with his left, then towards Pont Rouge with his right.

The attack on Hill 132 was launched on Jan. 8 1915 at 8:45 A.M., after a bombardment which lasted an hour and a-half. It was supported by artillery of various calibre, in which slow-firing guns of old type preponderated: 60 guns of 75 mm., 24 of 95 mm., 4 of 105 mm., 8 of 120 mm., 10 of 155 mm. (short), 4 of 155 mm. (long). This concentration represented a great effort at that period of the war, but it was insufficient, more especially as the French attack ended in a German attack, and the battle extended over a front of 10 km. Out of six breaches which the engineers were to have made in the wire with battens filled with petards four only were passable, but the others were opened by the attackers themselves. The four attacking battalions, drawn up in ten columns, seized the German trenches in a few minutes without great loss. All the German counter-attacks, preceded by violent bombardments, were repulsed during the two days of Jan. 8 and 9. On the 10th the French attack made further progress, but on the 11th the Germans succeeded in regaining a footing to the N. of Crouy.

On the night of Jan. 11–12 a flood on the Aisne swept away all the bridges at Villeneuve and at Soissons, except the "bridge of the English" at Soissons, so named because it had been constructed by the British army after the battle of the Marne. This unforeseen occurrence greatly hindered the sending-up of reinforcements and rations. The Germans had received considerable reinforcements in infantry and artillery. On Jan. 12, after a violent cannonade, they attacked Hill 132 and retook all the ground gained during the preceding days. Gen. Maunoury put at Gen. Berthelot's disposal the whole of the 14th Claës Div., one brigade of which was commanded by Gen. Nivelle. He wished to hold fast on his right with the 55th Div. and the composite Klein brigade whilst the 14th Div. should attack on the left towards Terny. But on the 13th his right was strongly attacked in the direction of Montal and Ste. Marguerite; these troops were very exhausted after six days of hard fighting without rest, day or night. Moreover, the 14th Div. had only made very small progress. The German artillery with direct observation could fire at effective range on the bridge at Soissons and disaster might follow its destruction. In these circumstances to leave French troops on the right bank of the Aisne was no more than a useless act of imprudence, and Gen. Maunoury gave them the order to retreat to the left bank. That retreat was carried out in good order during the night of Jan. 13–14, without being disturbed by the enemy. The losses totalled 161 officers and 12,250 men killed, wounded or missing.

On Jan. 25–26, after a very violent bombardment, which extended over several kilometres of front, the XVIII. French Corps attempted a local attack, which, in consequence of the collapse of a dug-out which buried several hundred men, lost the crest of Hurtebise on the Chemin des Dames. Then the positions became fixed on this part of the front until the French offensive of April 16 1917. (C. M. E. M.)

II. The Winter Battle of 1914–5

The part of Champagne in which the winter fighting of 1914 took place consists of a vast, gently undulating plain between two ridges of hills and plateaus which form its northern and southern boundaries. The greater part of its surface is formed of white chalk covered by a crust of arable soil, often very thin and in some places non-existent. This chalky plain is in its southern part known as "dusty" Champagne, and in its northern part as upper Champagne. To the E. of it lies the hilly upland country bordering the Argonne, a clayey, broken district, covered with woods and well watered. Towards the N. the central plain is broken up by a series of small isolated hills, the principal of which are the hills of Brimont (170 metres), Berru and Nogent l'Abbesse to the N. and E. of Reims and that of Moronvilliers (260 metres) further to the E. To the E. the Champagne plain rises in like manner to the hilly zone of Rémois and Tardenois. Ever since the beginning of the 10th century attempts had been made to improve this impoverished land by planting pines in geometrically formed clumps, which form a prominent feature of the landscape. After some 25 to 30 years at least the pine needles decompose into a kind of crust, and it is thus possible to cultivate with some prospect of success. To the N. of the Marne the Champagne plain is traversed by several streams; the Vesle running north-westwards from Somme-Vesle to the E. of Châlons; the Suippe practically parallel to it running from Somme-Suippe to the Aisne near Condé en Suippe; the Tourbe flowing in the opposite direction and N.E. of Somme-Tourbe towards the Aisne at Servon; and the Dormois passing by Ripont, Rouvroy and Cernay en Dormois in the same direction. The Py and the Alin flow respectively to the W. and to the N.E. between Breer, the Aisne and St. Martin l'Heureux on the Suippe. Several old Roman roads cross this region, notably those from Châlons to Rethel by way of Souain and Somme-Py from St. Menehould to Vouziers along the valley of the Aisne, all running in a general direction from S. to N. They are crossed by the road from Reims to St. Menehould, which runs at the foot of the heights of Moronvilliers, Nogent l'Abbesse, and thence by St. Hilaire le Grand, Jonchery, Suippes and Somme-Tourbe. Villages are rare and of little importance; Souain, Perthes les Hurlus, Hurlus, Le Mesnil les Hurlus, Tahure and Massiges are all poor and ill-constructed hamlets scattered over the vast plain.

The winter battle began at the end of 1914. After the battle of the Marne the pursuit initiated by the Allied armies was checked after a few days, principally owing to a shortage of artillery ammunition, and the opposing forces took up position and set to work to construct extensive lines of entrenchments of a kind that had not been seen since the 18th century. South of the Aisne the German front swung round to the E. of Reims, included the hills of Nogent l'Abbesse and the forts commanding them, and ran thence along the Roman road S. of the Moronvilliers heights, crossing the Suippe above Auhérive and passing S. of Souain, Perthes and Massiges and N. of Ville sur Tourbe to the Aisne. The choice of this line was not dictated by either strategical or tactical reasons. The two adversaries installed themselves in face of each other by means of a series of successive engagements, the German object being to maintain an unbroken front as close as possible to Verdun and Reims.

The French Higher Command considered that, despite the munitions crisis, the offensive must be resumed. The *moral* of the troops might well suffer from the wearisome hardships inseparable from trench warfare, for a kind of Siege of Sebastopol on a large scale appeared ill-suited to the temperament of the French soldier. Moreover, the "home front" had also to be considered; and finally it was necessary to do something to divert the enemy's attention from the Russian front. The British had opened their offensive sooner than the Germans had be-

lieved possible, and had thus contributed in no small degree to the victory on the Marne. But though this result had been achieved the first promise of their operations had not been fulfilled, and their initial success had been followed by a crushing defeat. It was thus of the first importance to hold fast on the western front as many as possible of those enemy troops who might be diverted eastwards if the situation there permitted it.

French G.H.Q. was, however, deceived with regard to the hostile situation. It was believed that the Germans too were suffering as acutely as the Allies from shortage of munitions, while the supposed losses in men and wastage of material were much in excess of the truth. All these causes contributed to Gen. Joffre's decision to adopt offensive policy, which was expressed in a general order issued to his armies on Dec. 17. "The hour for attack has sounded," it ran. "We have hitherto checked the enemy's effort; and now it is a question of breaking it and definitely freeing our violated national territory." It seemed as if a general offensive was to be undertaken on the whole front from the Swiss frontier to the North Sea; but as a matter of fact all that took place was a few isolated operations, notably in Flanders, Artois and Champagne.

The IV. Army, under Gen. de Langle de Cary, this time held the line between the V. and III. Armies from Marquirez farm near Prunay to a point between Boureuilles and Chalad in the Argonne. From left to right the front was held by the XII. Corps (to which were provisionally attached the 91st and 96th Territorial Div.), the 60th Reserve Div., the XVII. Corps, the Colonial Corps, and the II. Corps.

The operations began on Dec. 20 after a short artillery preparation, and although they were carried out on a wide front from Prosnes to the Argonne the results were not great. The offensive continued on the 21st and met with no better success. The XII. Corps lost heavily and was compelled to cease its attacks; the XVII. and Colonial Corps continued their efforts on Dec. 22, 23 and 24, capturing a part of the first German line at the price of numerous casualties. On the 25th the operations were suspended, and the enemy in his turn delivered a series of counter-blows which were repulsed. Towards the end of the month the IV. Army was reinforced by the IV. Corps from Picardy, which for the time being was held in reserve. At this period portions or the whole of eight enemy army corps (III., V. Armies) were opposed to the Allies in Champagne; from left to right these were a fraction of the VI., the XII. Reserve, the VIII., the VIII. Reserve, the XVIII. Reserve, a fraction of the VI., the XIII. and the XVI. Corps, besides Landwehr formations.

At the beginning of 1915 the situation was still very delicate in the Argonne, where the Germans reported every day captures of men and material, which French communiqués were unable effectively to dispute. This succession of minor checks could not fail to exercise some effect on the position in Champagne and to hinder Allied progress there. The enemy's resistance was very stubborn, and he passed from defence to attack on more than one occasion. Up to the end of Jan. the Allies continued the same monotonous series of small attacks in the Perthes-Beauséjour area, the net result of which was a small gain of ground to the N. of Beauséjour and Massiges. Continual bad weather and fogs then induced the command to order their cessation. By Jan. 15 the line had been pushed some 2,000 yd. to the N. of that held on Dec. 20; this had been effected after some 12 attacks and about 20 counter-attacks had been beaten off. In comparison with the terms of the general order for the offensive the smallness of the results achieved was striking, and the German High Command did not fail to use its opportunity of pointing this out, affirming that their opponents' losses on the whole front during this period were 26,000 dead and 17,860 prisoners, and the total casualties, including the wounded, 150,000 men at least, while their own losses were less than a quarter of this figure. It was stated that the German estimate of Allied casualties was 100% too large; but it seems certain that even so they were much in excess of those suffered by the enemy.

From Feb. 1 to 4 the front in Champagne became even more active; the French continued to progress slowly in the Perthes district, but on the 3rd there took place three German counter-attacks, to the W. of that village, N. of Mesnil and N. of Massiges, and in the last-named alone they met with some success, breaking the French main position on a 2,000-yd. front, and capturing over 600 prisoners, 9 machine-guns and 9 guns of small calibre. On Feb. 10, by a misunderstanding, an isolated attack was delivered near Souain by the 60th Reserve Div. against Sabot wood; the enemy reconquered the lost ground in the afternoon and captured over 500 prisoners.

The general offensive which was to take place on this date was postponed to the 12th, and then to the 16th. The Russians had just been defeated in the Masurian winter battle, and their X. Army had been practically destroyed. French G.H.Q. considered it essential to assume the offensive on a considerable scale in order to hold fast the German troops on the western front; an easy victory was expected and Vouziers was given as the ultimate objective of the advance. On Feb. 16 3,000 yd. of trenches were captured between a point N.W. of Perthes and N. of Beauséjour, with over 400 prisoners. The IV. Corps was held behind the XVII., ready to intervene. During that night ten German counter-attacks were repulsed; further progress was made on the 17th N.W. of Perthes, and prisoners were taken belonging to six different German corps—a singular mixture of units on so narrow a front. Two violent counter-strokes took place that night and the next morning between Souain and Beauséjour, but met with no success; five further efforts were equally repulsed during the night of Feb. 18–19. Fighting continued all next day, the advancing French troops meeting everywhere with stubborn resistance; they succeeded, however, in capturing a redoubt N. of Beauséjour, and another work N. of Le Mesnil. These partial attacks naturally proved unduly expensive in view of the results achieved; by the 27th the total of German prisoners taken since the 16th amounted only to 1,000, and the initial hopes with which the operations had been begun had thus in no sense been fulfilled. Meanwhile a new corps, the XVI., had been brought up from the Ypres area, and it was for the moment intended to use it in a new and powerful effort on the left of the battle front.

After the capture of the redoubt N. of Beauséjour on the 27th, units of the Prussian Guard which had recently arrived in Champagne delivered a night attack N. of Le Mesnil, but lost heavily and were defeated. French progress between Perthes and Beauséjour continued and by March the crest of the ridge parallel to the front of attack was secured. On the 3rd again the whole of the German trench system was taken to a depth of 1,000 yd. on a front of 6,000. On the 7th there commenced a series of attacks against a small copse—Sabot wood—which continued till the 15th; every day saw the same monotonous repetition of partial attacks and counter-attacks, every gain of ground being dearly purchased from the stubborn enemy.

On March 10 the German High Command announced that the winter battle in Champagne was virtually at an end, and that it had brought no change whatever as far as concerned the final result of the war. The main object of the French, to relieve the pressure on the Russians, had not been realized, any more than the proposed penetration to Vouziers. The Germans had made more than 2,450 prisoners; they had certainly lost heavily, more heavily even than in the Masurian battles, but still hardly more than one-third of the French casualties, which exceeded 45,000; and the new front in Champagne was more firmly established than ever. French G.H.Q. affirmed not less definitely, in a note issued on March 12, that the operations had attained all their objectives both local and general; the French had advanced to a depth of some 2,000 to 3,000 yd. on a front of 7,000 and had obliged the enemy to throw in reënforcements equivalent to a new army corps.

Both these assertions are disputable. The principal French objective, the relief of the Russian front, had been only imperfectly achieved. What were these 20-odd battalions diverted to Champagne in comparison with the masses engaged on the two fronts? Vouziers was still far off. The effect of the French attacks was greater than the enemy were willing to admit, it is

true, but they were out of all proportion to the sacrifices made. The truth is that the French methods had been found unsuited to the gaining of any real success; better artillery preparations, a larger scale of attack, not as hitherto a series of successive efforts on a narrow front, but an advance by large attacking waves along all the front of assault, and closer support of the infantry by the artillery, which should follow the advance and not remain tied to its first positions, were necessary.

The winter battle, however, was not yet over. On March 12 the offensive was resumed N.E. of Le Mesnil. By the 15th practically the whole of Sabot Wood was at last occupied. Operations continued in the next few days between Perthes and Souain, in the Perthes sector, N. of Beauséjour and N. and N.E. of Le Mesnil. Every foot of ground was bitterly contested, as witness the fighting for Jaune Brulé wood on March 18; but not till the 23rd did the French slacken their efforts. A letter of congratulation was addressed to the IV. Army by Gen. Joffre, and it was ordered to cease its attacks and consolidate its gains. One corps, the VIII., had alone lost close on 8,000 men, including 160 officers, between Feb. 16 and March 23.

Still the Champagne remained active. On April 8th, a violent German attack on Beauséjour redoubt was repulsed after an initial success. Thenceforward the enemy had recourse in the Perthes-Beauséjour area to mine warfare, with its alternative of long delays and sharp assaults. In May the French operations in Artois, and those of the enemy in Galicia which brought about the large-scale Russian retreat, threw the course of events in Champagne into the background. The only action of importance was the German repulse on May 16 at Ville sur Tourbe, of which their first communiqué made so much. In fact an assault delivered by two regiments in close order, following on the explosion of three large mines, resulted merely in the seizure of a few trenches, which were speedily recovered by the French Colonial infantry, with heavy losses for the enemy. (B. E. P.)

III. The Autumn Battles of 1915

After the offensive in Artois in May and June, activity on the French side was transferred to the Vosges and the Argonne, where local attacks were delivered throughout the summer, in the vain hope of confusing the enemy's ideas as to the point of delivery of the forthcoming offensive. At the same time preparations were taken in hand for an attempt in Champagne on a larger scale than ever before, and for a simultaneous and powerful diversion in Artois. The situation seemed to favour it. The increase in the British strength had permitted Field-Marshal French to extend his front; the French defensive system had now been so perfected as to allow of a reduction in the garrisons of quiet sectors and a proportionate increase in the reserves available. New divisions had been formed, and methodical instruction of the troops destined for the attack had been taken in hand. Finally there had been a great increase in the available supply of guns and shells.

In Champagne the object aimed at was nothing less than the complete rupture of the German lines on the front Bazancourt–Challeranges, so as to outflank their left N. of Reims and their right in the Argonne. It was also hoped, as before, to disengage the eastern front. The plan was to attack on a front of 25,000 yd. between the Moronvilliers hills and the Aisne.

The German defensive position, both in Artois and Champagne, consisted of a continuous front system, with several successive lines of trenches, and further back centres of resistance, themselves immense closed works, with a maze of trenches, capable each of holding out against assault. As a general rule these were some 2,000 yd. apart, but their exact situation was modified in accordance with the ground. This front system, comprising from two to five separate lines, and some 300 to 500 yd. deep, was followed by a second, traced on the ridge to the S. of the Py valley. It was carefully organized and provided with machine-gun positions and thick belts of wire sheltered on the reverse slopes.

At the beginning of Sept. the Germans had 70 battalions in Champagne, belonging to the III. Army (von Einem) and to the 50th Div., XIV. Corps, and XII. and VIII. Reserve Corps. During the artillery preparations which preceded the French attack they brought up 29 more (a division of the III. Corps, the 183rd Brigade, and half of the 43rd Reserve Div.), making in all 99 battalions on the first day of the battle. Ninety-three further battalions had to be put into line to fill up the gaps, so that their forces were practically doubled during the fighting; these were drawn either from the units at rest, such as the X. Reserve Corps, brought from Russia, or from the reserves of neighbouring sectors. In all, then, the Germans engaged 192 battalions. Their reinforcements came into line, not as large units with a view to being used for counter-attacks, but by small driblets thrown in hastily as need arose; no doubt the command, fearing a break through, parried the danger as best it could by using these troops in single battalions or even half battalions. There thus resulted a regular "hotch-potch," to use Col. Feyler's expression, on Oct. 2, between La Main de Massiges (Hill 199) and Maisons de Champagne, on a front of 12,000 yd., of 32 battalions belonging to 21 different regiments. The 5th Div., for instance, had one regiment near Massiges, one battalion of another regiment near Tahure, and one of a third at Trou Bricot.

On the Allied side the arrival of a new British army, the III., in the Albert area, and the extension of the VI. French Army's front to the N., had rendered possible the transfer of Gen. Pétain's II. Army from Artois to Champagne. Under the supreme direction of Gen. de Castelnau it was to attack in conjunction with the right of the IV. Army under Gen. de Langle de Cary, and the left of the III. under Gen. Humbert, which was opposed by the German V. Army. On the left of the III. French Army, the V., under Gen. Franchet d'Espérey, faced the I. and VII. German Armies. The Allied fighting forces in Champagne numbered in all 35 divisions, or 420 battalions, at least, more than double the German forces engaged. So little effort had been made to keep the forthcoming attack a secret that, as early as Aug. 15, an order issued by Gen. von Ditfurth announced that it was expected; and on Sept. 22 Gen. von Fleck foresaw a "desperate effort" on the part of the French High Command.

Thanks to the efforts put forward to provide the French army with the heavy artillery and munitions it had lacked hitherto, the preliminary bombardment began on the morning of Sept. 22 and continued for three days and three nights without cessation, and was directed against the whole of the German front as far back as the second position. At the same time long-range fire was carried out against the hostile headquarters, billeting areas, and supply depots, and the Bazancourt to Challeranges railway. The effect was on the whole considerable, certain enemy units being left for 48 hours without rations as a result of the bombardment.

On the 22nd and 23rd the weather conditions favoured observations of fire, but on the 24th heavy clouds blew up. Next day, at 9 A.M., broke in rain, which lasted for several days. This had no little influence on the result of the battle.

At 9:15 A.M. (zero hour) the assault took place along the whole of the long front, and the first infantry waves, in an irresistible rush, broke into the enemy's trench system. On the left the attack was directed against a salient between Auberive and the St. Hilaire-St. Souplet road; the first trench was taken but the attack was held up by uncut wire in front of the second line 1,000 yd. in rear. At the same time a counter-attack from Auberive, supported by the fire of the heavy artillery on the Moronvilliers ridge, took the French in flank; the left was forced back but the right held its ground. This first phase was very short, and thanks to weak resistance the French suffered little.

The enemy had another strongly fortified redoubt E. of the St. Hilaire–St. Souplet road. Astride this road to the left of it the French infantry broke into the first hostile trench system, but were checked by machine-gun fire. To the right the assaulting units carried four lines of trenches, covered by belts of wire and sheltered in the woods, capturing 700 prisoners and 7 guns and penetrating the hostile lines to a depth of 2,700 yd. In the Souain valley, which marked the right boundary of the IV. Army area, the advance was pushed forward rapidly in three different directions; to the W. it reached the wood of William II., 2,000

yd. from its starting point, while in the centre in less than an hour it was seen to be approaching Cabaret de Navarin farm, over 2,500 yd. from Souain.

To the E. the Moroccan division (II. Colonial Corps) carried the first German line in the first rush and penetrated into the wood near the Souain-Tahure road. Parties of the 28th Div. (XIV. Corps) took part in this whirlwind attack. In 17 minutes they had reached Trou Bricot, more than 1,000 yd. from their jumping-off trenches; by noon they had passed the Souain-Tahure road and reached the slopes to the W. of this latter village, having advanced some 4,000 yd. and made considerable captures of material (10 guns were taken by a single regiment). At this point they reached the hostile second position, which for the most part was sited on reverse slopes and was thus invisible save at a short distance. Before an attempt could be made to carry it a new artillery preparation was necessary.

In the Perthes gap French progress was quite as rapid. Two thousand yd. to the N. of the village the infantry reached the camp of Elberfelds, and captured some officers in their beds; they thus turned the left flank of the stormy redoubt N. of Le Mesnil; but the Germans held out in a switch trench for several days.

The XX. Corps attacked on the right of the XIV., the 11th Div. to the left, the 39th on the right and the 153rd in Corps reserve. The objectives of the 11th Div. were the Cuisines ravine and Le Mesnil hill, involving an advance to a depth of 3,000 yd. on a front of 3,000. After carrying these defences it was to push a further 4,000 yd. to the Dormois valley.

The first part of this programme was speedily accomplished but the right of the XIV. Corps, held up by uncut wire, left the flank of the 11th Div. in the air, and several enemy battalions, sheltered in two tunnels, running N. and S. under Le Mesnil hill, came out as soon as the French troops had passed on and fired into their rear; the left of the 11th Div. was thus enveloped and destroyed in a desperate fight against superior numbers. An attempt was then made to push forward the right and turn the hill on the E., but the reinforcements asked for arrived too late.

To the right of the 11th Div. the 39th had attacked, with its left moving on Maisons de Champagne. The crest on which this farm stood was taken and several enemy batteries surprised and captured. To the W., towards Bois Allongé, other batteries were rushed while in the act of limbering up. Further on two squadrons of mounted hussars intervened in a very unexpected manner; crossing the first enemy line despite a heavy barrage they debouched rapidly, attracting to themselves all the attention of the enemy, who to the number of 600 were then captured by the infantry who profited by the diversion caused by the cavalry.

On the extreme right the I. Colonial Corps was to capture La Main de Massiges, a complicated tangle of ridges, covered with trenches and dugouts. In the first rush the Colonial troops reached in 20 minutes the crater on the summit of Hill 191; the enemy counter-attacked but without success. The mopping-up of the captured ground was then begun and continued for several days. In the evening eight enemy trench lines had been taken, and on the Index, it was said, as many as nineteen.

Generally speaking the day had been highly successful, although at certain points the Germans still maintained their first positions. Almost everywhere the French had advanced some 2,000 to 4,000 yd., and Gen. de Castelnau believed that the road to Vouziers would soon be opened. But the French line was very sinuous, some units facing E. and some W. and the rest N. In the region of Perthes and Souain, Sept. 26 and 27 were devoted to straightening the line and in feeling forward up to the second German position on a 12,000-yd. front. The advance went especially well between Auberive and Souain, N. of the Roman road, where the VII. Corps did brilliantly. By the 28th the total area reconquered from Auberive to the western slopes of the Souain valley measured 16,000 yd. sq., and 3,000 prisoners and 44 guns had been taken.

To the E. the French troops succeeded in linking up, on the 27th, with those operating against Hill 193, W. of Tahure, surrounding and capturing a body of the enemy 2,000 strong; the camp of Sadowa and Hill 201 facing Tahure hill were taken also.

On the remainder of the front, as far as the Aisne valley, the pressure of attack continued by means of violent bombardments, bombing attacks and local offensives. But on the 26th the 39th Div. was driven from Maisons de Champagne, and a fresh attack by the 153rd Div. on the 27th in the same region only partially succeeded.

On La Main de Massiges the Germans received reinforcements drawn particularly from the XVI. Corps, and French progress henceforth became more difficult. None the less the I. Colonial Corps continued to advance between the 25th and the 30th. To the N. it reached Mont Têtu (Hill 199), and pushed down towards Ville sur Tourbe, capturing prisoners and material.

By Sept. 28 contact was made with the German second position on a front of 13,000 yd. from S. of St. Souplet and Somme-Py. Westwards the line bent back towards Auberive, which was still in enemy hands, as was also the hill of Le Mesnil and the neighbouring woods to the E. But progress towards Tahure and Ripont and possession of La Main de Massiges secured the envelopment of this last position on both flanks.

On Sept. 28 and 29 the French succeeded in setting foot in this second hostile position at certain points such as to the W. of Le Mesnil hill and Navarin farm. In this last sector they had even breached this line, but on such a narrow front that the enemy easily succeeded in preventing any further penetration. All hope of a break-through had disappeared. The V. Cavalry Corps, which had been brought forward in view of seizing any chance of exploitation, returned on the 28th to St. Remy, without even having gone into action. A general order dated Sept. 30 announced the close of the operations, the results of which included the capture of 25,000 prisoners of whom 350 were officers, 150 guns and a large amount of material of war.

On Oct. 6 the second German position was almost intact; the attack was held up in front of it in extremely difficult conditions; the French troops were in poor and half-finished trenches, hastily dug on bare slopes and exposed to flanking and enfilade fire. The attacks which continued till Oct. 8 were difficult to carry out and cost many men. Tahure hill and the two Mamelles (Hill 187) N. of Le Mesnil were, however, taken, but Le Mesnil hill remained in enemy hands. Several attacks and counter-attacks took place at the end of Oct. and the beginning of Nov. without resulting in any material change in the situation.

According to Gen. Mangin the Sept. offensive in Champagne cost the French 80,000 killed and missing and 100,000 evacuated sick or wounded. It was therefore extremely costly, and one cannot say that the results achieved were in proportion to the sacrifices and efforts. The Allies had engaged in Champagne and Artois 52 French and 13 British divisions, more than were put into line at the battle of the Marne. These masses were supported by 1,300 French and 300 British heavy guns. The consumption of munitions by the II., IV., and X. Armies attained enormous proportions—3,980,000 rounds for the 75's and 987,000 for the heavy artillery. It was admitted that this last figure especially was too small for good results to be achieved; the Allied fire had been insufficient to destroy the enemy's accessory defences or the trenches of the second and third lines, especially on the reverse slope. Finally the front of attack, 25,000 yd., was not wide enough to prevent effective flanking fire.

In short, the offensive had not all the character of suddenness, rapidity and continuity that was desirable, and it went on too long, involving heavy losses without hope of decisive results. Thus there arose the conception of offensives with limited objectives, which when adopted as a general policy became fatal. In some quarters there became observable a tendency to adopt an even simpler method, that of "nibbling" at the enemy by partial attacks; it was forgotten that by this means the Allied troops used up their moral and physical strength at least as rapidly as that of their adversaries.

(B. E. P.)

IV. The French Offensive on the Aisne, 1917

Plan of the Offensive.— The Allied plan of campaign for 1917 was drawn up, like the preceding one, at a conference which

assembled at Chantilly, on Nov. 18 1916, together with the commanders-in-chief, Joffre and Sir Douglas Haig, and all the heads of the British, Italian, Russian, Belgian, Serbian and Rumanian Missions.

The formation of new German divisions led it to be supposed that there would be a repetition of an attack during the early days of the spring, probably on the western front. It was therefore decided that active operations should be pushed forward on each front in every possible way compatible with climatic conditions. " In order to deny to the enemy the initiative in resuming operations, the Allied armies will be ready to make a joint offensive from the first half of Feb. 1917, with all the available forces at their disposal." The beginning of the offensive would be fixed according to circumstances and by common consent of the commanders-in-chief, who would maintain between themselves the " closest liaison." The Russian High Command declared its willingness to undertake the task of putting Bulgaria out of action; the Allied army in Salonika, brought up to a strength of 23 divisions, should coöperate. The mutual support that the Allies gave each other during the preceding year should continue, and the Franco-British and Italian staffs should jointly study questions of transport and the coöperation of troops.

General Joffre therefore drew up from Nov. 27 a general plan of attack. From Feb. 1 the French armies were to be ready to attack between the Somme and the Oise, at the same time as British forces between Bapaume and Vimy; from Feb. 20, the group of armies forming the centre would attack in their turn in Champagne between Pontavert and Reims.

The method of these attacks is detailed in instructions dated Dec. 16 and based upon experience gained both at Verdun and on the Somme. They were to take place on as large a front as possible, to aim at carrying the enemy's artillery positions in order to disorganize the defence by the capture of their guns, and to follow each other with the shortest possible delay in order to gain the whole advantage of any results obtained. The break-through was to be exploited boldly and vigorously; for it is the strength and rapidity of attack which ensures success. The tactical development, which must be indicated in operation orders, is to be realized by the grouping of forces according to the lie of the ground, the strongest forces being reserved for those sectors where progress can be most rapid. The preparation of attacks with artillery support is moreover studied in detail in these instructions; they indicate clearly, however, a change of method and consider the possibility of being able to break the enemy front by mass attack rapidly executed, carefully prepared and studied in its smallest detail.

The question of exploiting a successful attack is not forgotten, and its rapidity should embarrass the enemy and anticipate the arrival of his reserves; the attacks have a definite objective, but they are no longer forced to limit themselves to this objective.

M. Briand's Government strongly urged decisive offensive for the spring of 1917; political parties supported this. The effect produced on the public mind by the prolongation of hostilities and by a war of attrition was exaggerated; it was feared that German submarines would prevent the import into France of food and raw materials; lastly, the maintenance of combatant forces was, it was stated, becoming difficult. In the Chamber of Deputies the War Commission in Dec. handed to the Government the report of M. Violette supporting its conclusions: " If we are wise, we shall recommence active operations from the end of Feb. . . . the initiative in the great battle is a question of life or death for France."

It was in these circumstances that Gen. Nivelle took over the command of the French armies, in order to carry out the operations decided upon by the Allied Governments, drawn up by the Allied general staffs, and in which the plan of attack had been decided upon in general instructions issued by his predecessor. He considered that the front of attack might be slightly extended, and that there would be a great advantage for the progress of the offensive in Champagne in capturing the Chemin des Dames, a formidable position which overlooked the whole plain, and which assured him a bridgehead on the right bank of the Aisne. Furthermore, the attack on the Somme and that on the Aisne must be simultaneous, and not successive, as in the original plan.

The Anglo-French offensive in the N. was to begin with a considerable straightening out of the British front.

Sir Douglas Haig was to attack Vimy with his I. Army, at the same time the III. and V. Armies should reduce the pocket left between Arras and Bapaume after the success of 1916. Following this, a concerted action should be undertaken in conjunction with the northern group of French armies, which was to operate between the Somme and the Oise. General d'Espérey had relieved Gen. Foch of his command, the latter having been unjustifiably placed in disgrace after the battle of the Somme, the results of which were misunderstood.

On the Aisne the French offensive was to stretch from Vailly to Reims; Gen. Pétain, having been consulted by the new commander-in-chief regarding the offensive that had been planned, had very frankly expressed his criticism, which made it difficult to employ him in carrying out the operations. General Nivelle therefore entrusted their preparation to Gen. Micheler, who at this moment was strongly in favour of a lightning mass attack. The V. Army under Masel, which had occupied the front of the attack since 1914, closed up on its right in order to make way for the VI. Army, of which Gen. Mangin had just assumed command; the X. Army under Duchesne was held in reserve in order to exploit any success after the line had been broken.

The operation plans were drawn up for the various branches of the command according to the usual procedure. The general officer commanding, Gen. Nivelle, gave directions and indicated the form of attack; the commander of the group of armies, Gen. Micheler, fixed the objectives; the commanders of the armies, Masel and Mangin, shared the task amongst their army corps, and the instructions which were given to them were strictly limited to the rôle of their armies in the battle. It could not be otherwise, the commander-in-chief alone is in a position to conceive and draw up the plan of an offensive on a grand scale, as this presupposes a thorough knowledge of the general situation, of the possible coöperation of Allied armies, of the strength and resources of the national armies and of the enemy armies, as well as the instructions issued by the various war commissions—and finally of the intentions of the Government.

General Nivelle had decided on a smashing attack, aiming with the first assault to capture the enemy positions and the entire zone occupied by the artillery; this idea was in accord with the orders issued on Dec. 16 and signed by his predecessor, carried out on two occasions under his orders at Verdun. Such an operation appeared quite feasible, and no one raised any objection to it. He foresaw also, immediately after the break-through, the possibility of rapidly exploiting his success; the breach made would be immediately enlarged on both sides and the " *armée de manœuvre* " brought into action: " the later development of the operations having as its object to bring the main forces *as rapidly as possible* in a northerly direction: the main pivot *Craonne-Guise*."

General Micheler, in transmitting these directions, added that, in his opinion, the whole of the operations could be accomplished either on the day of attack or at the latest on the morning of the following day. As the objective to be reached he sketched a line passing to the farther side of the hills which overlook the north bank of the Ailette, reaching the plain of Laon to the N. and pushing in an easterly direction beyond the fort of Brimont. The first schemes of the operations called forth exchanges of opinion, as is always the case under similar circumstances. The only reservations were made by Gen. Mangin, who asked that preparations for attack, followed by this actual carrying out, should take place on several other sectors of the front, in order to obtain at the very least a relative surprise; he asked for exceptionally powerful artillery in order to shorten the period of preparation without endangering the actual task of destruction; and he added: " Seasonable weather is of great importance; march rapidity demands good going of the roads; the development of the operation would be assisted when the days are long and the nights clear. It is to be hoped that operations carried out prior

to the main attack will have denied to the enemy freedom of movement and initiative in attack, and that we shall be able to hope for the splendid day when we shall be able to bring into action our colonial forces." He pointed out to the commander-in-chief that, on a front of attack so difficult, without direct ground observation, it would be very nearly necessary to wait for fine days, when aerial observation is good and the ground hard.

These requests and observations were submitted to the High Command as an appreciation to be examined and compared with all others and to affect the final decision, which was the responsibility of the commander-in-chief alone.

General Nivelle never ceased repeating that it was necessary "to go on as far as possible" after the day of attack; Gen. Micheler fixed a first line to be reached in three hours and a second line three hours after. He went into too minute details which did not allow any initiative to his subordinate commanders; some differences arose which Gen. Nivelle had to smooth over.

To go on as far as possible implies that the attack continues until it encounters an obstacle which it cannot overcome without the help of new and methodical preparation; it is not by orders issued that the attack will be stopped, but by the action of the enemy; the High Command prepares itself to profit by the confusion brought about so often at various points of the field of battle, and, with this end in view, prepares its subordinates by pointing out very distant objectives. This is a principle second to none, and its application in 1918 brought victory to the French after giving the Germans their victories in March and May.

The necessity of foreseeing the exploitation of any success after a break-through is obvious; it was particularly evident in 1917. It was necessary to compel the general staffs and cadres of all formations to study the requirements demanded in a war of movement (which for a long time were lost to view), to think out the equipment of the foot soldier and the lightening of kit, the formation of columns, their march and supply, to decide upon the grouping of the heavy artillery which should rejoin in succession each army corps and army, to study natural obstacles, the network of roads, etc.

General Micheler obviously went rather far when he contemplated a threat on the enemy communications, "who would then be squeezed up between the Ardennes and the southern point of Holland," but this anticipation, realized in the following year, did not go beyond the general staff of the armies.

Military Situation.—The preparations for the offensive were in full swing when, on March 14, the withdrawal of the German line on the Hindenburg position commenced; this extended, on March 10, to the front between the Oise and the Aisne. The pursuit was immediate and vigorous. The Germans were hustled on to a prepared line, a line at which they had prepared to limit their withdrawal and to allow themselves time to organize at leisure the Hindenburg position. The completion of their field works, hampered by artillery fire, cost them considerable losses.

The German retreat had long been thought out and prepared. Only a small quantity of booty fell into the hands of the Allied armies. The evacuated zone had been systematically destroyed. It was not to be wondered at that all the roads of communication had been destroyed—that was war; to destroy inhabited places which could be used as a shelter for troops and which were near to the firing line is admissible, although this practice is straining severely the demands of war necessity. But to devote a large quantity of explosive to blow up stately ruins, like those of the castle of Coucy, and much manual labour to cut down the fruit trees—that is savagery.

It is essential to point out that important means of destruction were thus diverted from military use; by blowing up larger stretches of road, by felling a larger number of trees planted along their line of retreat, the Germans could have hindered to a great extent the advance and supply of the French troops. But not only against the Allied armies did the Germans wage war, but against the people of France, struck at in their past as in their future, in their artistic, industrial and agricultural wealth.

The plan of operations drawn up by Gen. Nivelle was necessarily modified by the withdrawal of the German line; the preparations in full course of execution of the army group under Franchet d'Espérey fell through, and on this front it was necessary to be satisfied with pushing the enemy in the direction of St. Quentin. But the British attack took up the greater part of its strength. On the Aisne, between Vailly and Neuvilette, the French attack retained all its power to operate; Gen. Mangin pointed out that during the withdrawal the German line had formed a right-angled salient in the direction of Laffaux mill and that an attack to the N. of this salient, directed vigorously, would take the Chemin des Dames in rear. General Micheler, commanding the group of armies of reserve, after some difficulty transmitted this suggestion to Gen. Nivelle, who accepted it and sanctioned the employment of two divisions. The remainder of his unattached troops were employed in a new attack to the E. of Reims on the Moronvilliers *massif*, which the IV. Army under Anthoine prepared to attack. General Nivelle calculated that the German withdrawal, which was a confession of weakness, only confirmed his desire to attack the German armies as soon as possible with all his forces. The modifications on the front of attack were sufficiently important, but on the whole he thought that they would improve a situation already favourable for an offensive.

Political Complications.—But two new events called into question even the principle of an offensive. On the demand of the German High Command, unrestricted submarine warfare had been decided upon by the Imperial Government, in spite of the formal declaration of President Wilson that the United States would look upon it as a definitely hostile act. All parties, even the most extreme, had approved of that resolution; the only reservation, entirely platonic, was made by the Socialists, and that was to throw the responsibility for it upon the Governments of the Entente who had rejected the German offers of peace.

The Central Powers faced the entry of the United States into the war with their eyes wide open; they calculated that their army would never be of more than very mediocre value and that its transport to Europe would be very difficult. The declaration of unrestricted submarine war was made to the United States on Jan. 30. On Feb. 3 President Wilson declared solemnly to Congress that relations with Germany were broken off; on April 5 and 6 the Senate and the House of Representatives recognized the state of war with Germany.

Almost at the same time the Russian revolution broke out. The Tsar Nicholas II., who had opened the Hague Peace Conference, and who had granted to his people their first franchise, suppressed alcohol, and, during the war, had shown himself to be a faithful ally whose help had often been invaluable, had fallen under the influence of the Empress, a German by birth; and she was under the control of the monk Rasputin and of German influences. The Tsar had become more and more detached from his people. From March 7 to 12, disorders broke out and grew in intensity; the provisional Government, which had been formed, collapsed with the imperial throne, and Russia fell into the hands of a power both erratic and weak, incarnated in the person of Kerensky. He proclaimed loyalty to the Alliance, but his military power appeared to diminish with the loss of discipline in the army. The Allies could no longer count on the Russian offensive scheduled for the spring.

Whilst this was going on, an incident took place on March 20 at a sitting of the Chamber which led to the resignation of the Minister of War, Gen. Lyautey, and, in consequence, of the Briand Cabinet. His successor, M. Ribot, chose as his Minister of War M. Painlevé, who, backed up by an important party in Parliament, had refused to enter the Briand combination because he disapproved of the nomination of Gen. Nivelle as commander-in-chief, because he was not in favour of that system of war which Gen. Nivelle, to his mind, typified.

M. Painlevé questioned those army commanders whom he presumed capable of being able to provide him with arguments against the intended offensive, but not the others. He increased their hesitation without even understanding it. These conferences took place without the commander-in-chief, who was informed by his subordinates but not by the minister. General Nivelle was also aware that a superior officer had been deputed at

the ministerial office to draw up a dossier against the offensive scheme, and he was disturbed about it. Nevertheless, none of the generals interrogated recommended that the offensive should be given up; they did not believe that it would lead to all the results foreseen by their chief, but they did not take the responsibility of advising its abandonment. Their opinion, therefore, was limited to absolutely sterile criticism.

On March 24, M. Painlevé also consulted Sir Douglas Haig and a number of British officers; without going into details of method, their unanimous advice was "to strike rapidly, with full force, a great blow at the enemy"; and he became convinced at the beginning of April, after the Russian revolution and the entry of the United States into the war, that the British were resolutely in favour of the great offensive.

It would have seemed that the Minister of War would be satisfied with that. But, on April 3, a conference took place at his instigation at the Ministry of War between M. Ribot, President of the Council, the Minister of War, the Minister of Marine Adml. Lacaze, the Minister of Munitions M. Albert Thomas, the Minister for the Colonies M. Maginot, and Gen. Nivelle.

The question for discussion was to examine if the offensive, the date of which was fixed for April 8, should take place in the new situation following the German withdrawal, the Russian revolution, and the entry of the United States into the war.

This conference, which took place five days before the date fixed for the offensive, was useless; it was unable to decide anything, unless it were the meeting of the War Committee to examine the same question—that is to say, if there was any reason to interfere with the British, in order to modify the plans drawn up in agreement with them and of which M. Painlevé had just learnt that they were firm supporters. Worried by questions concerning the way in which the attack would be unfolded, the commander-in-chief affirmed his unshaken belief in a rapid break-through, followed immediately by the foreshadowed exploitation which would, in the course of about three days, bring the group of armies under Micheler up to the Serre, 30 km. from his position of attack. In the course of the discussion, the necessity of destroying the first and second lines was pointed out, as well as the advantage of attacking when the weather was favourable.

It was decided that "the commander-in-chief should attack on the front which he had selected, at a time when he judged his preparations were complete, and on a day to be chosen by him." He had accordingly a free hand.

Everything appeared to be settled, and Gen. Nivelle free at last to prepare for the coming offensive, when Gen. Messimy, Deputy and formerly Minister of War, commanding one of the brigades which was going to take part in the offensive, approached M. Ribot, president of the Council, and handed him a report which, he said, expressed accurately "the opinion of officers of the highest repute in the French army and notably even that of the general who was to direct the coming offensive, Gen. Micheler." This report called for the immediate despatch of eight French and British divisions to the Trentino, and affirmed that only limited results could be obtained from the offensive and only at the price of important losses. The report said further that the order should be given immediately to wait for fine weather before beginning offensive operations in France, and in conclusion the commanders of groups of armies should be listened to, either singly or together, commencing with Gen. Micheler.

This report did not bring out anything new, and it was fatal as in the end the irresolution of the Government communicated itself to the subordinate staffs. It was sufficient, however, to bring about the assembly at Compiègne on April 6 of an extraordinary council of war; the President of the Republic, the president of the Council, together with the three Ministers of National Defence, the commander-in-chief and the generals commanding army groups, Micheler, Pétain, d'Espérey, were present. General Foch, who held the rank of commander of an army group, had been sent hastily the day before to Italy and was therefore not present. The Minister of War asked if the new situation did not modify the circumstances of the offensive. General Nivelle pointed out the necessity for an immediate offensive, carried through to the end; the commanders of army groups were all of his opinion on this point, and Gen. Micheler, in direct contradiction to the memorandum which had brought about the war council, got up and said: "It is necessary to attack as quickly as possible, as soon as we are ready and the weather is favourable." All expressed however, in different ways, their doubts concerning an immediate break-through.

General Pétain was particularly explicit: there were sufficient forces to pierce the enemy front but not to develop success. General Nivelle thereupon said: "Since I am not in agreement with either the Government or with my subordinates, nothing remains for me to do except to place my resignation in the hands of the President of the Republic." Everyone then protested that it was impossible to change the commander-in-chief on the eve of an attack of which all had admitted the necessity, and Gen. Nivelle, after some hesitation, refrained from sending his letter of resignation. The net result was that the council of war broke up without deciding anything except the necessity of the offensive.

Before the commission of inquiry into the operations on the Aisne, which was called together in July 1917, Gen. Foch expressed himself thus: "Nivelle indeed acted thoughtlessly in accepting the invitation to be present at the conference at Compiègne; but I return to the point that the Government, having heard the opinions expressed at this conference, invited Gen. Nivelle to carry through the operations." General Pétain, having recalled the fact that he had pronounced an opinion unfavourable to the offensive, first to the Minister of War and later to the president of the Council, concluded by saying: "The Government, fully informed, took no notice. The chief responsibility therefore rests on their shoulders."

The report of the commission, which comprised Generals Brugère, Foch and Gouraud, is severe on the conference: "The doubt which had crept into the minds of the chief actors would not have been dissipated by the meeting on April 6. They did not give that mutual confidence and that belief in success which give to the commander-in-chief that energy and incentive that enable him to overcome events." The report records that there was no intervention taken to counteract the action of the commander-in-chief nor to weaken his orders, although the majority of those who met at Compiègne considered them as unrealizable. General Nivelle was allowed a free hand, with the reservation which was not clearly expressed, that if, after 24 hours of fighting, the results were indecisive and losses too heavy, the operation should be broken off. General Nivelle, however, reiterating his belief in a rapid penetration, declared that he did not wish to offer battle in half-measure, and that he did not know what form the struggle would take, once it was engaged. However, the two officers that Gen. Nivelle had taken with him to draw up the report had been dismissed and no written statement had been made. Everything remains, therefore, confused concerning this "extraordinary" council of war, the reason of the meeting, the debates and the conclusion. The memorandum of Gen. Messimy asked that the army group commanders might be consulted "either separately or together," but it did not ask that they should be confronted with their commander-in-chief before the foremost leaders of the State; it is necessary to point out, as well, a regrettable difference between this memorandum, which was based chiefly on the observations of Gen. Micheler, and the attitude of that general before the conference; all the army group commanders had been consulted by the Minister of War, at the instigation of Gen. Messimy, who had received satisfaction without being aware of it. The *raison d'être* of the conference thus vanished.

All the army group commanders considered that the offensive was absolutely necessary, and they thought that Gen. Nivelle anticipated from it results which it was not reasonable to hope for. They had spoken of this at the Ministry of War; they repeated it at the conference with different variations which, however, did not affect the essence of their declarations. With what object, then, to reproduce them? The Government are responsible for the general conduct of the war, but the commander-in-chief, their choice, has the command and the responsibility for the operations. The Government considered that the offensive was necessary and

repeated their view on April 3. If they no longer had confidence in the commander-in-chief—let them remove him. Even if this confidence continues or if it diminishes after a change of command on the eve of an attack, why take away so much of its chance of success by undertaking so hazardous a thing?

Assembled without rhyme or reason, this "extraordinary council of war" killed the confidence between the commander-in-chief and his subordinates, a confidence already affected; this ordeal, which had never before been inflicted upon a military commander, threw Gen. Nivelle into a state of anxiety, however impassive he might be before the enemy in battle.

The Offensive.—In accordance with the instructions of Gen. Nivelle, the British offensive commenced on April 9 before Arras and was continued until April 14 with great success.

It is true it had not effected a break-through but the advance was important and the booty taken considerable: 14,000 prisoners and 104 guns. The battle continued on this front. On April 14, the army group under d'Espérey had felt the Hindenburg line at the approaches of St. Quentin and had recognized its strength without being able to make any impression with the weak effectives available.

Fixed for April 12, postponed to the 14th and then to the 16th on account of bad weather, the offensive on the Aisne had been prepared in minute detail. First of all, it had been necessary to develop the lines of communication between the Marne and the Vesle and from there up to the front lines. A hundred and ten kilometres of ordinary gauge line had been constructed, 20 km. of metre gauge, 308 km. of 60-cm. gauge; 25 km. of cart roads and existing roads had been broadened on a length of 55 km. Twenty-two thousand men had been employed on this task. Four thousand five hundred tons of transport with an effective personnel of 28,000 men represented the automobile sections.

Forty kilometres was the front of attack; the VI. Army under Mangin, with a front of 15 km., consisted of 17 infantry divisions, one cavalry division and one territorial division; the V. Army under Masel, on a 20-km. front, consisted of 20 infantry divisions and one cavalry division. The VI. Army had 742 heavy guns, 846 field guns, 81 large-calibre guns, 504 trench mortars. The V. Army had 1,016 heavy guns, 860 field guns, 1,056 trench mortars, 91 large-calibre guns. The plan of artillery employment allowed quiet registration from April 2 to April 4, counter-battery work on the 5th and 6th; then the destructive bombardment commenced on the 7th and was to have been complete on the 11th; it was continued until the 15th, owing to the postponement of the attack. More than 3,000,000 rounds were fired.

The shooting, however, was hampered by rainy weather and by bad organization of the fighting planes, concentrated unfortunately with the army groups. During the too rare flying hours, the range-registering planes were not protected, and Gen. Mangin's urgent calls for their protection by fighting scouts met with no response. The VI. Army under Mangin had not been able to receive the number of short-range guns that had been asked for to destroy the Hindenburg line on its left, nor the long-range guns that had been asked for to accompany the attack on its right. Nevertheless, and in spite of what may have been said, the preparation was good on the whole and the *moral* of the troops had risen to the highest pitch. The Hindenburg withdrawal was rightly considered an avowal of weakness; the Russian revolution had removed a Court and a Government bound to Germany, and it was looked upon as an outburst both patriotic and liberal which recalled the dawn of the French revolution. The hesitations of the Government and of certain of the staffs had not had time to permeate the troops.

On the morning of April 16, the French infantry rushed from their trenches and captured the first German line on the whole front. The right and centre of the V. Army advanced two to three kilometres. The tanks, used for the first time, were detailed for the capture of the third enemy position; their unexpectedly slow progression left intact the observing posts of the Germans from which they directed the fire of their artillery on them; and owing to the too long distance which they had to cover they had loaded themselves up with extra petrol cans which were set on fire by the shells. The infantry had not been trained to coöperate with them and profited little from their advance. They suffered heavy losses; in this first experience the heroism of their crews bought very dearly slender results.

The left of Masel's army was immediately stopped on the Craonne plateau. The 10th Colonial Div. of the VI. Army under Marchand captured the position of Urtebize with magnificent dash and some elements reached as far as the Ailette; but on the plateau of Craonne and Vauclerc, the enemy machine-gunners came up out of deep dugouts where they had remained under the shelter of the artillery. The struggle was very severe, and the detachments that had penetrated too far were taken in rear and compelled to retire. In the centre, progression was more satisfactory although difficult; the attack, stopped after an advance of between 500 and 2,000 metres, was renewed; on the left the set-off was good, but the advance was rapidly held and even thrown back at certain points on to its initial line.

The battle had not assumed the aspect foreseen, but continued. It was not the rapid and tremendous success anticipated, but it was success. As in all dispositions for attack, there is a tendency to block in front; the reserves in closing up to the front lines are liable to get bunched together and to come under enemy artillery fire, thus suffering heavy losses; in the VI. Army, precautionary measures taken in advance enabled them to remain on the left bank of the Aisne. In addition the counter-battery work had been most efficacious and had much allayed the effects of the enemy artillery. Machine-guns had stopped the attack. The system employed at Verdun under similar circumstances was immediately remembered, the centres of enemy resistance should be attacked, after having concentrated on them the fire of the necessary number of batteries, but the attack should be continued. This is less wearing for the attacker than for the defence.

On April 16, commencing at 10 o'clock in the morning, Gen. Micheler took all the heavy artillery of an army corps from the VI. Army under Mangin, then three sections of 155-mm. guns; in the evening all his reserves were taken away and his ammunition supply reduced. On the morning of the 17th, Gen. Nivelle visited the headquarters of the army group, where he was insufficiently informed of the situation, and then he took the decision of stopping the attacks of the VI. Army towards the N. and of pushing those of the V. Army towards the north-east.

This order was fortunately somewhat delayed in transmission, and on the 17th the attack continued actively on the centre of Mangin's army, with a very noticeable advance on the front Braye en Laonnois–Ostel.

As the pressure continued on the front Vauxaillon–Laffaux, the Germans could no longer hold in the pocket into which they had been squeezed and they gave ground. But the order of Gen. Nivelle commenced thus: "1. The battle fought yesterday clearly indicates the intention of the enemy to hold fast on the front of the VI. Army and to make difficult and costly in consequence the advance of your army to the north. . . ."

As the situation had changed, Gen. Mangin gave orders for a vigorous pursuit, which hustled the enemy and caused him heavy losses; the commander-in-chief approved of this action the following day. The fort of Condé was occupied. At the same time a very slow advance continued on the Chemin des Dames.

Commencing on the 17th, the IV. Army under Anthoine, belonging to Pétain's army group, had attacked the Moronvilliers *massif* and had secured important gains. The enemy counter-attacks were shattered on the 19th. Splendid artillery observation posts remained in the hands of the French. It was a limited success, but a very appreciable one.

From the 16th–20th, 21,000 prisoners and 183 guns had been captured in the French offensive; little progress had been made, but the advance of from six to seven kilometres, on the Aisne front of 12 km., resulted in the capture of a dozen villages, together with the fort of Condé and all the observation posts which overlooked the valley of the Aisne.

The railway from Soissons to Reims was fired. At last the evacuation of Laon began. *Moral* remained good at the front, excellent in the VI. Army, and the efforts of defeatist propaganda,

very harmful among the French public, had not yet begun to make itself felt in the army. In the meanwhile German exhaustion continued very fast. Of 52 divisions in reserve on April 1, 16 only remained unengaged. The anxieties of the German High Command could be seen after April 16 in the unusual nature of their *communiqués* which appeared to prepare public opinion for the worst eventualities. From that moment their *moral* declined rapidly. The results were not such as had been anticipated, but they were better than those resulting from previous offensives and had been gained with fewer losses.

The number, however, of these losses were greatly exaggerated by rumours which were circulated among certain classes in France and even in certain districts where no information could have come from the front. Enemy agents worked freely and with the connivance of the highest authorities, as certain trials before the High Court and Council of War subsequently showed. In addition to this numerous French deputies had followed the attack on April 16, either from Gen. Micheler's battle headquarters or from the lookout at Roncq. Their accounts spread amongst their friends who shared all their sincere feelings. It is necessary to have a great experience of war not to allow oneself to be unduly influenced by the flock of wounded who pour back to the rear at every big attack after the first day. Having raised alarm in the French Chamber, these accounts, mutilated and exaggerated, spread amongst the public, strengthening the effects of enemy propaganda. The enemy cleverly exploited this.

It was a regular Austro-German counter-offensive, perfectly organized, which turned the French success into failure. During the course of an operation both sides always exaggerate the number of their losses, which later information diminishes as soon as the situation becomes more clear; but exceptional reasons for mistake vitiated all calculations. Precise numbers of the losses were given, very different but all enormous. The first official estimate had been obtained through wrong calculation based on an average of men killed; this calculation was arbitrarily augmented by adding thereto the number of missing. In the second estimate the wounded were counted several times over owing to their passing through the hands of various medical units, to which were added the enemy wounded who had been treated in the French ambulances. When eventually the casualty lists from the armies did arrive the wounded amongst the colonial troops and the Russian brigade had been counted twice over, and that mistake (although proved by documentary evidence) was long maintained before parliamentary commissions by the French Minister of War, who made no attempt to calm the agitation. The rumour spread that the terrible losses were due to insufficient artillery preparation, that whole battalions had been thrown into the assault against uncut wire, that no precautions were taken for the evacuation of the wounded, and that numbers of wounded had succumbed through lack of medical attention. Scapegoats were looked for and guarantees demanded.

Continuation of the Offensive in the Middle of New Complications.—The commander-in-chief continued his operations in an atmosphere that became more and more hostile to him. However, the continuation of the offensive had raised no objections either at Compiègne on the 19th, when the French Minister of War came down to inform himself of his intentions, nor on the 20th at Paris, when Gen. Nivelle had been instructed to discuss matters at the Elysée. The X. Army under Duchesne had come into action between the V. and VI. Armies on the Craonne plateau.

General Micheler wrote on the 21st that the offensive undertaken to the N. appeared to him to require forces superior to those which he had available, and pronounced the opinion that it would suit him if he could limit himself to local attacks which he set out in detail. Gen. Nivelle ordered then that he should limit himself to the relief of Reims by carrying Brimont and giving more freedom on the heights of Moronvilliers, already captured, and at the same time to complete the seizure of the Chemin des Dames. Preparations for these two attacks began, but each one of them gave rise to characteristic incidents.

The operation on the Chemin des Dames towards Craonne led to an overture on the part of a young French deputy, who was serving as an officer on the staff of one of the army corps detailed for the attack, to the President of the Republic, in which he pointed out to him the anxiety experienced by the generals entrusted with this operation. An exchange of notes between the Chief of the State and the commander-in-chief was the result and a consultation of generals summoned, an example of the regrettable discussion which was going through the Government and the High Command.

The intended attack on Brimont gave rise to direct intervention on the part of the minister regarding the detail of the operation. General Pétain, who was selected to carry out the newly created functions of chief of the general staff attached to the Ministry, received in his department the scheme of all the operation plans. M. Painlevé, whilst conferring with Gen. Masel, commanding the V. Army, explained the detail of the operation against Brimont, and it seems that a misunderstanding arose between the two speakers regarding the probable number of losses. The scheme gave rise to conversations which lasted from April 22 to 29, and the minister instructed the commander-in-chief to suspend the attack on Brimont which the artillery had begun to prepare for. Generals Nivelle and Pétain were invited to discuss this question on the 30th, and the mutilated plan which appeared as a result of these conversations ended in the small attack of May 4 against two commanding positions. The French seized them, but they were driven off after losses which were really fruitless. Decisions taken affecting the direction of the French armies were the result of indifferent compromise between divergent wills; they were no longer commanded.

The British Government meanwhile, anxious regarding the results of the submarine war, were alarmed at the same time at the intentions which the French Government expressed.

Before the attack on April 16 they had learnt that the French War Cabinet intended to suspend the offensive at the end of a few days if the anticipated results were not attained, or at any rate nearly so. Also, as early as the 18th, Mr. Lloyd George asked Sir Douglas Haig "what would be, in his opinion, the effect produced if the French War Cabinet instructed Gen. Nivelle to cease offensive operations at a not-far-off date."

The noteworthy reply that Sir Douglas Haig made to this question on April 19 must be mentioned:—

"In my opinion the decision to suspend immediately the offensive operations, until such a time when Russia and America should be in a position to join us (probably not before next spring), would be most unwise. The struggle is following a normal course. Great results are never obtained in war so long as the enemy power has not been broken; and against an enemy both powerful and determined, operating with large effectives on a broad front, it is a matter of time and hard fighting." Sir Douglas Haig asserted afterwards "that the chances of success, this year, are remarkably good, if we do not relax our efforts," and he stated that "the future would confirm that forecast—that the suspension of the offensive would be more costly than the offensive itself." On the 26th Haig was called to Paris to confer with M. Ribot and M. Painlevé, who pointed out to him the enormous losses of the French army: 25,000 killed and 95,000 wounded, they said, when the real numbers, confirmed at this time by the casualty lists of the armies, were 15,000 and 60,000; they considered the necessity of stopping the offensive.

Before the members of the French Government Sir Douglas Haig maintained the view that he had expressed to his own Government; the results were not those that had been hoped for, but were such that he found them satisfactory. The German reserves were at this moment inferior to the Franco-British reserves; it was therefore necessary "to continue the battle to the end." On being asked a definite question by Sir Douglas Haig the members of the French Government replied that "the battle should be continued without modification of the general idea of the plan of operations drawn up conjointly."

The British Government became more and more anxious owing to the hesitation displayed by the French Government, and instigated two conferences which were held at Paris. At the first Gens. Pétain and Nivelle, Field-Marshal Sir Douglas Haig

and Sir William Robertson, Chief of the Imperial General Staff, met together. In reviewing the general situation they were forced to admit unanimously the absolute necessity of continuing offensive operations on the western front. A large part of the German reserves were exhausted, but if the enemy was given time to recover himself he would be free to attack either Russia or Italy with the greatest chance of success, and he would thus be able to hold on until the submarine war had obtained its full effect. In the new situation it was not a question of breaking the enemy front and of reaching at one blow distant objectives, but of exhausting the enemy's resistance. Once this object was gained "it was necessary to develop the results to the utmost possible."

The members of this conference were of the same opinion when they affirmed the necessity of fighting with all forces available, with the object of destroying the enemy divisions. "We are unanimous in thinking that there is no half-measure between that method and a defensive, which at this moment would be equivalent to a confession of weakness. We are unanimously of the opinion that our aim cannot be arrived at except through unceasing attack, with a limited objective." Allied staffs would determine methods and dates.

In the afternoon of the 4th the ministers of the two countries met at the Quai d'Orsay together with the members of the military commission. Mr. Lloyd George explained that he felt the need of persuading himself that all were quite agreed on the principle of the continuous offensive, the details of which were settled by the responsible authorities: "We prefer that the generals keep to themselves everything which concerns their plans of operation. When they are put on paper for communication to ministers it is seldom that the ministers alone see them. What we do not need to know is the precise locality of the attack, nor the date, nor the number of guns and divisions engaged. It is essential that these details remain secret. In England we do not ask these questions." He changed the preamble of the military commission into a formal pledge of the British Government, specifying always that the expression "limited offensive" was not to be understood as an attack by two or three divisions, but as an operation analogous to that which the British armies had just carried out before Arras. Mr. Lloyd George further insisted that, considering the situation with which both parties were faced, a serious and continued effort was absolutely necessary. He endeavoured to show the French Government all that had been done since the month of April: "We must not allow ourselves to underestimate the results of our offensive. Doubtless great hopes had been held that had not been realized. But if we did not *hope* for more than was possible perhaps we would not find that enthusiasm which was so indispensable in war."

He enumerated the captures: 45,000 prisoners, 450 guns, 800 machine-guns and 200 sq. km. reconquered. "Suppose that it had been the enemy who had obtained this success . . . and imagine the wave of pessimism that would have swept over the public. That is sufficient to show the reality of the success which we have gained. . . . The losses which we suffer are very painful, but it is impossible to avoid them if we wage war. . . . If it is a question of saving human life we say that feeble and repeated attacks cost as much as, and more than, wholehearted attacks. . . . I hope that these considerations will lead you both," addressing personally M. Ribot and M. Painlevé, "to admit that we must exert all our efforts at once."

The Prime Minister of England spoke in the forcible and virile language of a true statesman. Well informed of the situation in his own country, he sensed the value of time when it came to men and money. He understood war and all its exigencies, even the hardest; he was capable of the high direction of war because he knew how to govern the expert without entering into the detail of his technique. Mr. Lloyd George took with him to England a written promise, but it was wrapped round with such reticence that he could not have had many illusions concerning the duration of the attack "*sans rèpit*" to which the French Government had just pledged themselves.

Whilst the British offensive was in full swing on the Scarpe the struggle continued in Champagne on the Moronvilliers *massif;* a violent German counter-offensive had been repulsed on April 23 and the IV. Army under Anthoine seized Mount Cornillet. The Craonne *massif* was seized on May 4, and the mill at Laffaux on the 5th, together with a whole series of positions which the German counter-attacks failed to retake; it was a good success, but it should have been completed by advancing to the Ailette, for the X. Army held on to the crest with difficulty, where it suffered for many weeks heavy losses, which were due to the suspension of the offensive and not to the offensive itself.

The results of the Franco-British offensive were 62,000 prisoners, 446 guns and 1,000 machine-guns taken; the French armies had lost, April 16-25, 15,000 dead, 60,000 wounded and 20,500 missing. On the whole front of attack the advance was carried far enough to force the enemy to reconstruct his battle-line on an 80-km. front; important positions remained in the hands of the Allies: the Vimy crest, the Laffaux mill, the fort of Condé, the Chemin des Dames, and the Moronvilliers *massif.* Railways of great strategic value were freed. If to these gains be added those resulting from the withdrawal in March, obtained by the mere threat of attack, the first months of 1917 represented for the Entente a total of very valuable successes.

The total of German losses had not been made known, but it can be estimated approximately by basing it on the number of divisions which were engaged on the attacking front. On April 1 43 divisions were in reserve in rear; nine were *en route* for the French front, two coming from the eastern front and seven being newly constituted. The German armies had therefore 52 divisions available. On April 22 this figure was reduced to 16; on April 25 to 12; on May 4 all their divisions had been engaged. It was necessary to draw on the quiet sectors in order to maintain the battle. At first, divisions withdrawn from the front could, before returning to the line, take a few days' rest and refit. This soon became impossible. This wear and tear increased to an unbelievable extent; the remnants of troops withdrawn were thrown, without transition, on the Argonne front or on the heights of the Meuse. The 11th Guards Div., for example, cut to pieces from May 5-10 on the Californian plateau, was identified on May 18 in the Argonne; and the 28th Div., relieved on the 18th, was identified in front of Verdun on the 28th. These divisions' only rest was during the time of their displacement. The same statements are made as concerns the English front; all goes to confirm the extreme wear and tear of the German army.

On May 25, 99 divisions had already appeared on the front, amongst which 11 had appeared twice; there had been as well 110 divisional movements. But now the number of German divisions which took part in the battle of Verdun in 1916 was 43 in 10 months; in 3½ months 137 divisions had fought on the Somme. In 1917 the wear and tear was thus treble.

It is quite true that Gen. Nivelle had not obtained that breakthrough which he had hoped for, but thanks to the length and vigour of the attack the exhaustion of the enemy was very near to attainment. The Allies were in a position to profit by this, because, at the moment when the German reserves were entirely used up, 30 divisions remained intact on the side of the Entente: 16 French and 14 British. As the Germans had a total of 150 divisions on the Anglo-French front, as against 178 Anglo-French divisions, the system of reliefs was much more favourable for the Allies. One can understand then why the British Government and High Command insisted on the continuation of the attack.

But were the French troops iu a state to repair their losses and to continue the offensive?

On April 1 1917 the French armies on the front consisted of 2,005,000 men, a figure which had never been reached before. In order to keep up this figure the 1918 class was available, and those that had not been called up from the preceding classes, which might be put down at a total of over 300,000 men for the coming year. Besides, during that very year, after the release began from all the war factories, more than 700,000 men were taken from the front for work in the interior in spite of the protests of Gen. Nivelle, and later of his successor Gen. Pétain, who, in order to arrest this excursion to demobilization, had to threaten his resignation. The suspension of the offensive was inexcusable.

Ludendorff confesses now his qualms: "Our consumption of troops and of munition had been extraordinarily high. We were not able to foresee what would result from the fighting or what efforts we should be called upon to make." He attributes his safety in the spring to Russian inaction during the Franco-British attack, and in the summer to French inaction. "As I reflect, and imagine that the Russian success had been gained in April to May instead of in July, I do not see how the High Command could have been able to remain master of the situation. . . . The Russian offensive came too late, in July, two or three months after the beginning of the Franco-British offensive; there was no concerted Allied action, as in autumn 1916; each went his own way and we were able, acting as we were on interior lines, to repulse and defeat separately our adversaries who were not working in conjunction." And, in fact, six German divisions were taken from the French front in June 1917, which contributed to a large extent in stopping Brussilov's offensive. It is true that the French Government was not in a position to cause the Russian army to act; however, the continuation of the French offensive would have produced the same effect in using up the German forces, and it is, moreover, quite certain that it was possible to attack again in July the German front, weakened as it was by these previous deductions, and, in consequence, to arrive at the final result foreseen by Ludendorff. In May 1917 the German army was in a condition which only occurred again in Aug. 1918; but then the Entente knew how to profit by it.

The French Government had in their service at Rechézy, near Belfort, a most perspicacious intelligence agency, under the direction of Dr. Buchert, which being as it was on the borders of Switzerland and Alsace-Lorraine made use of the most varied sources of information. This information, now published, testifies to the great anxiety of public opinion in Germany. M. André Hallays, who was stationed there, thus expresses himself: "On reading the German newspapers of the latter half of April it is impossible to make any mistake; behind the line everyone had then the feeling that the armies had just suffered a series of heavy set-backs before Arras and on the Aisne. Whilst at home a wave of pessimism swept over the country and the madness of certain politicians pervaded the Government, the press and the public; whilst false-rumour mongers, exaggerating the importance of our losses and the seriousness of certain mutinies, exerted themselves to give to France the impression of defeat—whilst this was going on the German staff found itself obliged to multiply reports and comments in order to reassure the dismayed Germans." These attacks had come as a terrible surprise to them. When the strategic withdrawal took place had it not been promised that "tremendous events" would result from that "stroke of genius"? Had it not been inferred that the areas so carefully devastated would become the theatre of a new offensive? And now it is the armies of the Entente who assault the German positions, capture thousands of prisoners and threaten new positions! In vain the *communiqués* sang of victory; in vain the military critics announced that, thanks to "an elastic withdrawal," the High Command had saved the blood of the soldier, that the attempt to break through had failed, that the *communiqués* of the Entente were a tissue of lies, and finally that Hindenburg and Ludendorff knew how to husband reserves and to retain the initiative.

Public opinion, preoccupied by strikes, remained insensible to these consolations, and was only struck with the enormity of the losses. From May 1, after the threat of revolution was definitely dispelled, news coming from France was read with more attention. Extracts from Paris papers were telegraphed by agencies, the accounts of debates in the French Parliament were noted; the enemy himself was proclaiming his defeat. The press bureau hastened to take advantage of the innumerable signs that the adversary showed of his discouragement. They persuaded Germany that she had just gained "a great defensive victory." Thus they succeeded in wiping out the disastrous impression which prevailed after the battles of the Aisne and in Champagne; nevertheless a "defensive victory" was not what the people expected; success of this nature did not bring the date of peace any nearer.

The French Government, however, shut its eyes to information which contradicted its preconceived opinion, whether it came from the French or British staffs, from the British Government, from French agents abroad or from the German newspapers. French public opinion, left without information or guidance, was more and more worked upon by enemy agents. "Treason stalks freely abroad," said M. Galli in a report to the military commission in the Chamber; "from the lobbies of the Chamber, from the anterooms of ministers, the most foreboding rumours of discouragement ooze forth." Scapegoats were sought for; on the 27th, on this same commission, the French Minister of War was called upon to censure Gen. Mangin, around whose name had been conjured a very tissue of lies which a few months later had to be refuted by those of his colleagues who had arrived at unjustifiable conclusions. Yielding to pressure, which he believed at the time to be irresistible, the French commander-in-chief asked the Minister of War verbally that Gen. Mangin might be relieved of his command. The French council of ministers, taken unawares by the Minister of War before any report or written request had been made, agreed to this on the 29th, and it was quite useless that M. Painlevé became convinced that very evening that none of the charges brought against the general commanding the VI. Army could be justified. A later correspondence conducted between the commander-in-chief and the Minister of War cleared the position of Gen. Mangin.

The authority of the commander-in-chief had not ceased to be diminished after the arrival of M. Painlevé at the Ministry of War. This authority, impaired by the conferences of ministers with the army group commanders, further shaken by the conference at Compiègne on April 6, the echoes of which still resounded, had been killed by the way in which the functions of the chief of the general staff were exercised, functions delegated to Gen. Pétain, who, moreover, had been selected with his assent. The commander-in-chief was unable to order an attack, however small it might be, without being compelled to submit all the details to a general who had openly found fault with all his operations and who appeared to be his successor designate. The *crise* concerning the command had been no secret for a long time, but it was on May 9 that the President of the Council announced it to the military commission of the Senate; the following day, at the French War Cabinet, the Minister of War asked Gen. Nivelle to offer his resignation under any protest which he liked to choose. Considering that a change in the French High Command would be regarded by the enemy as a confession of defeat Gen. Nivelle refused to hand in his resignation, and hesitation on the part of the Government lasted several days. The threat, however, of resignation by the Minister of War and the attitude of the President of the Council determined the council of ministers to relieve him on May 15 by appointing Gen. Pétain. General Foch succeeded as chief of the general staff.

The Battle of Malmaison, Oct. 23–26 1917. Evacuation of the Chemin des Dames by the Germans, Nov. 2 1917.—The hesitations which had succeeded the offensive of April 16 on the Chemin des Dames had cost the French much more dearly than the offensive itself. The German line formed a right-angled salient at the Laffaux mill—and the safety of the position to the S. of the Ailette depended on its possession—for which the two combatants had so hotly contested in May. The battle had slackened in intensity in June and gradually died away in July. Called upon to prepare an offensive with limited objectives at this front, Gen. Maistre, commanding the VI. French Army, had fully realized, since June, that his advance to the Ailette would render the whole position on the Chemin des Dames untenable to the Germans, and he had proved the advantages which the enveloping line continued to offer to the attack on this sector of the front. Ludendorff tells us in his *War Recollections* that the same thought had occurred to him and he had thought of withdrawal, but Gen. von Boehen, commanding the VII. Army, was certain that he would be able to repulse any attack; when, towards the middle of April, indications of attack were evident, he asked for two reënforcing divisions and additional artillery; after having received this help he believed himself to be absolutely certain of

success. His effectives had now been brought up to eight divisions on this sector of the front, where the deep caves and concreted shelters and the undulation of the ground offered enormous strength to the defence. General Maistre, on the 12 km. of the attack front, between Moisy farm and La Raque, had in position three army corps in the formation of a square, two divisions in the first line and two in the second: from left to right, the XIV. Corps under Marjoulat; the XXI. under Degoutte and the XI. under Maud'huy; elements of the XXXIX. Corps under Deligny had to support the attack on the right. One thousand eight hundred guns were at his disposal: 900 of 75 mm., 850 heavy guns and 50 long-range or large-calibre guns, besides 460 trench guns. Never before had such a mass of artillery thundered on such a narrow front. The long range guns were placed on the flanks where they could take a large portion of the German line in rear; the field artillery had been pushed up close to the parallel lines of assault in order to be able to support the attack as long as possible. The artillery preparation lasted for six days and completely disorganized the German position. The heavy shells reduced to shambles a number of prepared underground caves. On Oct. 23 at 5:15 A.M., in darkness and in foggy and cold weather, the attack began.

The XIV. Corps under Marjoulat, attacking from W. to E. towards Allemant, seized at one bound the two lines of trenches which constituted the first position, and then captured the village of Allemant, after having surrounded it; the tanks assisted them to reach the second position and a turning movement brought the corps in position facing north. On its right, the XXI. Corps under Degoutte, by an unimpeded advance, captured the two German positions together with the village of Vaudesson and even that of Chavignon, where it found itself in position in line.

The XI. Corps under Maud'huy supported its right; the 38th Div. under Guyot de Salins (which had captured Fort Douaumont on Oct. 24 1916) had the honour of seizing Fort Malmaison and from thence advanced up to Voyeu-Chavignon. The 66th Chasseur Div. was less fortunate, and overlooked Pargny-Fillain, which still remained in the hands of the enemy.

During Oct. 24 and 25 the advance continued and reached the Ailette as far as Chavignon. But it was only on Oct. 26 that victory was complete on the right, thanks to the intervention of the XXXIX. Corps under Deligny.

The Chemin des Dames was taken in flank and in rear; a relief division, caught by the French artillery, had not been able to come up, and supply had become impossible. During the night Nov. 1–2 the Germans were compelled to evacuate it. "Our losses had been very severe," said Ludendorff, "some divisions had been cut to pieces." For himself, he was indifferent whether he was on the N. or the S. bank of the Ailette; but "after our fights during the whole summer for the Chemin des Dames I suffered a pang in giving the order to abandon it, but we would have suffered losses incessantly if we had wished to stay on there."

This great victory, obtained with relatively small losses, was emphasized by the capture of 11,157 prisoners, 200 heavy guns, 222 trench mortars, and 720 machine-guns. For its careful preparation, clever handling and happy consequence, it will remain as a model of an offensive with limited objectives.

(C. M. E. M.)

V. Battle of Soissons–Reims, May–June 1918

From the outset the aim of the main German offensive in 1918 had been to break the spirit of the opponents of Germany by numerous blows in the quickest possible succession and to dispose them towards peace. If, therefore, the German Supreme Command wished to retain the initiative, the first great blow must be followed, as rapidly as the transport of the powerful weapons of attack permitted, by a second blow. In itself the most favourable course would have been to continue the attack against the English front at Ypres and Bailleul. But here such strong English and French reserves had been posted ready in the meantime that the attack would have to reckon with strong Allied resistance. Similar conditions obtained on the neighbouring German attacking front farther to the south. Before the front of the VII. and I. Armies, on the other hand, the Allies, relying on the difficulties presented to the attack by the strong positions on the heights of the Chemin des Dames, accessible only with difficulty, had weakened their forces, having sent to Flanders a large proportion of the fit and rested French divisions stationed here in exchange for French and English divisions worn out with fighting there and in need of rest. The disposition of the Allied forces suggested that they expected a continuation of the German offensive on the front between the North Sea and the Oise, since by far the greater part of their reserves were held in readiness there, to the considerable weakening of other fronts, notably before the German VII. and I. Armies, facing whose inner wings were stationed three war-worn English divisions. So the choice of the front of attack and the battle-ground fell on the oft-contested chain of heights between the Ailette and the Aisne, the Chemin des Dames.

The Battlefield.—The tract of land between Reims and the great wooded districts of Compiègne and Villers-Cotterêts is divided by the different tributaries of the Seine and the Oise, running from E. to W. into several parallel strips. The most northerly of these strips is a pronounced ridge with steep declivities northwards to the Ailette and southward to the Aisne; along its summit runs the Chemin des Dames leading from Craonne to the Laon-Soissons road. These heights afford an uninterrupted view far over the country lying to the north. In its superior height lies the tactical significance of the Chemin des Dames, for the sake of which so many heavy engagements had already been fought. Since the Chemin des Dames had been in French occupation, Laon with its important railway centre lay under their fire. South of the Aisne lies a second ridge, bounded on the S. by the Vesle. On the left bank of the Vesle rises the third strip consisting of the wide hill country which descends on the S. to the spacious valley of the Marne.

The Allied Position.—The French position ran along the Chemin des Dames, and farther eastward into the valley. In front of the position was the Ailette, in whose valley the listening posts of both sides were close to one another. The French positions were not only of great natural strength by reason of their favourable situation, but were also just here particularly strongly fortified by every technical device. The French also had at their disposal a numerous artillery of all calibres. The German attack on these positions was therefore to be regarded as a bold attempt, whose only prospect of success was in effecting a surprise on the French and English and in keeping secret from them the preparations for attack, especially the advance of the artillery.

Dispositions for the German Attack.—The German Supreme Command had decided, on the basis of a plan of attack proposed by the army group under the Crown Prince as early as the end of April, to attack with the VII. and I. Armies from the district south-westward of Laon—southwards of Berry-au-Bac in the direction Soissons-Fismes-Reims. If this attack proceeded favourably it was to be prolonged on the right over the Ailette to the Oise and on the left as far as Reims. Simultaneously an attack by the XVIII. Army was to be prepared westwards of the Oise with its centre of gravity in the direction of Compiègne. The German Supreme Command hoped that the push southward would succeed in reaching the neighbourhood of Soissons and Fismes, and by this means attract strong forces from Flanders, so that it might be possible to continue the attack there according to plan. The army group under the Crown Prince Rupprecht was to remain purely on the defensive. On this front, as on other sections of the western front where attack was not intended, feigned preparations for attack were to be made.

Preparations began about the middle of May. The VII. Army under Gen. von Böhm was charged with the main German attack across the Chemin des Dames, the I. Army under Gen. Fritz von Below with the neighbouring attack on the left, and the XVIII. Army under Gen. von Hutier with the at-

tack in the direction of Compiègne. The right wing of the main attack, LIV. Corps and VIII. Reserve Corps, had the task of pushing forward in a south-westerly direction on both sides of Soissons, after taking possession of the plateaux W. of Neuville-sur-Margival and the heights of Jouy and Ostel. The XXV. Reserve Corps was to make its way on both sides of Cerny-en-Laonnais direct towards Braisne, and on the E. to take as much country as possible towards the S.; the IV. Reserve Corps was to attack the "Winterburg" (*i.e.* the height at the extreme western end of the Chemin des Dames, immediately N. of Craonne) with the main force and advance farther in the general direction of Fismes; in concert with this on the left the LXV. Corps, especially charged with the attack on the hills N. of Pontavert, was to occupy with its left wing the river bend N. of Berry-au-Bac.

Of the I. Army at first only the XV. Army Corps, advancing simultaneously with the VII. Army, was to throw the opposing forces over the Aisne-Marne canal. The corps was to provide itself with bridgeheads in order to take the heights of Cormicy if the attack of the VII. Army proceeded favourably.

A further attack to the right of the main attack was prepared by the VII. Corps of the VII. Army, which with its centre of gravity on both sides of Guny was to push forward over the Ailette, making its way in a south-westerly direction towards the Oise. This enterprise was not, however, possible until a few days after the beginning of the main attack, since its execution demanded that a section of the artillery used in the centre of the VII. Army should be moved to that position. The total number of divisions taking part in the attack was 41. The whole attack between the Oise and Reims was indeed planned on a wide front, but its aims were localized.

Measures for Securing Secrecy.—The whole success of the undertaking depended on the element of surprise. It was all the more necessary to pay the most careful attention to the measures for the disguising and concealment of the attack as good flying weather and dominating observation posts favoured the enemy's intelligence service. It was necessary to overrun the Chemin des Dames at the first onset, before the local reserves could come into action. The fundamental principle laid down was that the preparation for attack should involve no change of any kind in the landscape. The reconstruction of battery positions, roads, camps or shelters must be reduced to the minimum, or be so camouflaged as not to be visible on the airmen's photographs. The German fighting aircraft continually watched the ground of the front of attack, rail and road traffic, telephone, wireless and postal services receiving the closest attention. All assemblage of troops behind the new front of attack had to be effected with the utmost caution and generally only at night. Every troop, every column, entering the region under the command of the attacking armies received a sheet of instructions in which all the measures necessary for secrecy were again expressly pointed out. There was to be no visible sign of the increase of the number of men bivouacked in any particular place. All transport was to be concealed under trees and irregularly placed. On the appearance of enemy airmen the roads must be empty of troops. No smoke from new positions was to be permitted by day, and at night bright firelight was to be avoided. Guides familiar with the locality were allotted to reconnoitring staffs, so that they might not make mistakes through ignorance of the country. In day-time road traffic was not to exceed its ordinary quantity. All movements for the advance, especially of battery reënforcements and munitions, were to take place only under cover of darkness. The greatest stress was laid on deadening the noise of transport in moving up batteries and munitions to forward positions. All orders and marked maps were kept under lock and key in quarters the farthest to the rear, and might not be taken either on reconnaissances in the foremost lines or into forward positions. Published orders repeatedly warned the troops of the probability of a hostile offensive, in order to maintain the belief that all the preparations made were merely defensive. All the dispositions for secrecy were regularly tested by special officer patrols.

Artillery Preparations.—The great difficulties of an infantry attack against the immensely strong positions on the heights of the Chemin des Dames were clearly realized. The ascent of the steep slopes was only possible if the German artillery had succeeded in silencing the greater part of the opposing artillery. Therefore, the greatest attention must be given to the artillery preparation. Col. Bruchmüller, whose capacity had been already proved in the earlier offensive, was entrusted with this.

The ground over which the artillery was to advance consisted of the depressions N. of the heights N. of the Ailette and the valleys running up to the enemy position and partly overlooked by him. The preparations for the artillery advance were carried out by the divisions in line, the corps staffs entrusted with the attack moving up early enough to be able to direct these preparations. The orders given for the artillery advance were so complete in every detail that a perfect coordination of the whole body of artillery was thoroughly ensured. The infantry had to be firmly convinced that their business in the attack would be substantially eased by the annihilating effect of their own artillery. The numbers of the artillery provided by the Supreme Army Command proved on the whole sufficient.

The employment of the artillery was based on a calculation of the number of batteries, and the kind and calibre of gun required. The reënforcing batteries and columns were brought up this time for the most part by rail, contrary to the practice in the March offensive. Transport arrived from the whole front; the batteries were in most instances placed, to begin with, behind the ground on which the advance was to take place and beyond the zone of the enemy fire. Extraordinary caution was ordered during the advance of batteries pushed up far to the front. The unnoticed advance of the foremost batteries was most effectually assisted by the deafening noise of the frogs of the Ailette valley as it effectually drowned the noise of transport. In the placing of artillery care had especially to be taken that the shelter of the barrage was assured to the infantry, not only over the summit of the ridge of the Chemin des Dames but over its southern spurs during the descent to the Aisne. For this purpose an exceptionally bold disposition of the batteries was necessary. The mass of the artillery had to be pushed unusually far forward. Hundreds of batteries were brought into position, thickly massed in some parts, almost directly behind the foremost line of infantry. The unexpectedly great success was undoubtedly partly due to this exceedingly bold disposition of artillery. Single pieces of the heaviest guns with flat trajectory were also pushed far forward, almost into the line of the other batteries, so as to be able to bring under fire the detraining railway stations lying far behind the enemy line and the quarters of the higher staffs.

In contrast to the procedure in the former attack all registration was to be abandoned, in order to surprise the enemy as completely as possible. Effective bombardment was to begin immediately; and the first object was to be a thorough gassing of the hostile positions right down into the Aisne valley. The bombardment was divided into three phases. The first consisted in a general surprise artillery attack against infantry positions, batteries, mine-throwers, command posts, central telephone stations, camps, and headquarters, with all batteries and as far as practicable with gas munitions. The second phase was directed to an intensified action against artillery, for which purpose the field batteries attached to the infantry were also drawn in, in order to put the opposing batteries out of action at as early a stage as possible. The third phase was directed especially against infantry and artillery positions and targets in the distant rear of the front.

The beginning of the attack, in contrast to former procedure, was timed before day-break in the earliest morning twilight. This was done with the less hesitation, as the preliminary registration had been abandoned and there was no need to wait for daylight. The beginning of the attack before dawn, moreover, offered substantial advantages for the success of the infantry attack and its exploitation, for which the whole light day was thus made available.

During the infantry attack the principal task of the artillery was to protect the storming infantry while keeping down the opposing artillery fire, to protect the assaulting infantry by barrage advancing in front of them, as well as by the fire of the guns accompanying them. After the infantry attack, owing to the experience gained in former offensives, only so many batteries were to be brought forward as could certainly be sufficiently supplied with enough munitions. Provision was also made to meet the great difficulties which the steep ascent on the S. bank of the Aisne presented to the artillery, by preparing men and material for the building of roads.

All these measures demanded the most meticulous care for every detail, and it was vital that nothing should be forgotten. The placing in position of the attacking divisions and the artillery groups, with all the other preparations, was completed by the evening of the 26th. The beginning of the attack was fixed for May 27.

The Artillery Battle.—In the night of May 26–27 punctually at 2 A.M. the German artillery bombardment suddenly began, completely surprising the French and English. This went successfully from the start. The whole valley of the Ailette, the steep slopes of the Chemin des Dames, the Chemin des Dames itself, and the country lying far behind down to the Aisne, were in a short time thoroughly gassed, so that, as was later ascertained, a great part of the gunners left their batteries in panic at the beginning of the bombardment, and many pieces were destroyed at the very beginning by direct hits. In the first ten minutes observers announced numerous munition fires in the battery positions and ammunition dumps of the opposing armies. The fire against infantry and artillery positions was also well directed. Thanks to the powerful effect of the superior strength of the German artillery it was already clear, after an hour and a half's bombardment, that the opposing infantry and artillery were sufficiently subdued to enable the German infantry to venture the assault.

The Infantry Attack.—Punctually at 4:40 A.M., while it was still quite dark, the German infantry advanced to the attack. Without difficulty or delay they crossed the Ailette valley which was covered with bushes in some places and marshy in others; during the ascent to the Chemin des Dames serious infantry fights only developed at Chavignon, Pargny and Fillain; on the other sections of the front the German infantry pushed forward almost without resistance on to the heights of the Chemin des Dames. Here the remarkable effect of the artillery preparations was already apparent: the steep slopes had been surmounted, and the first lines were taken almost without firing a shot. The rising sun saw the first files of prisoners descending into the Ailette valley. The procedure adopted in previous attacks by the infantry had also stood the test on this occasion. There were no innovations in infantry tactics.

By 7 A.M. the I. Army had already reached the canal, the objective of their attack, and part had crossed it. Since they were to await the left wing of the VII. Army before further advance, a halt had to be made there according to orders. Thus the opposing army gained time to reform their units and to rally, while those in front of the VII. Army were overrun by the advance of the attacking divisions so long as they felt the effect of overwhelming German artillery fire. This was an essential difference between the attack of the I. and VII. Army, and was to be of decisive importance.

By 9 A.M. the German infantry, after breaking through the whole enemy system, had reached the line Vauxaillon–Jouy-Pontavert–Berry-au-Bac; on rapidly built roads, accompanying batteries and mine-throwers had also reached the heights of the Chemin des Dames and followed close on the heels of the infantry. Numerous aeroplanes attached to the infantry and artillery accompanied their advance over and before their fronts, while the battleplanes in repeated flights helped to break recurring resistance.

The Passage of the Aisne.—The farther advance from the heights of the Chemin des Dames against the Aisne became a regular race between the divisions of the VIII., XXV., and IV. Reserve Corps and the LXV. Corps. Without waiting for fresh orders each division, taking advantage of the successful surprise over their opponents, had on its own initiative pressed forward without halting. Soon after 11 A.M. the first German companies crossed over to the southern bank of the Aisne on bridges mostly intact. A vast and unexpected success had been gained. A wide and apparently impassable stretch of country, which had been for years the scene of the heaviest fighting, had been captured within a few hours after a short artillery preparation. Of the divisions of the defenders two English and three French had almost ceased to exist. The survivors streamed into the prisoners' collecting stations, while countless guns stood abandoned in their positions, some of them undamaged.

In the afternoon and evening the attack on the principal fighting front of the VII. Army went forward without a pause farther in the direction of the Vesle valley. Engineering and road-making troops worked with the utmost effort to level a path for the columns following through the enemy positions and over the steep way up to and down from the Chemin des Dames.

On the two wings the advance was considerably slower; on the right, before the front of the LIV. Corps S. of Vauxaillon, and at Laffaux, the Command had not recognized so quickly the favourable nature of the situation, and had not attacked with such unsparing vigour as in the centre; otherwise Soissons would probably have fallen on May 27 and at latest on the 28th, and the French, before they could have organized themselves for resistance, would have been compelled to evacuate all of the ground lying between the Oise and the Aisne. Here, just as before the front of the I. Army on the heights of Cormicy and farther E., the French had time to take up a position and to rally for fresh resistance, so that the infantry engagements became gradually more and more severe. The machine-guns had to be taken one by one, and here and there the enemy artillery again became active. The VIII. Reserve Corps also could only take Vailly after heavy fighting. Here again rich booty in guns fell into German hands, among which were the railway guns, famous for their bombardment of Laon, which had been injured by the German long-distance guns and their withdrawal thus delayed.

The Vesle was reached by the XXV. and IV. Reserve Corps, and in the darkness sections of the XXV. Reserve Corps passed southwards of Courcelles and Paars, while sections of the IV. Reserve Corps occupied the steep slopes at Fismes and Magneux. On this very first day of fighting the Germans had penetrated the enemy positions over a front of about 60 km. to a depth of about 20 km. Over 15,000 prisoners and immeasurable army supplies had been taken. The German losses were proportionately small.

The second day of the battle, May 28, saw the first violent counter-attack of the opposing army against the right flank of the German attacking troops. The attempt was made in this to prevent a further widening of the breach on either side, and the first available reserves were flung against the German wings, divisions being hurried up by rail, motor and boat, in order to arrest and throw off the German thrust. Nevertheless the speed of the German advance was not lessened on this day. On the right wing the LIV. Corps, after repulsing French counter-attacks, captured the heights N. and N.E. of Soissons. On the left the German divisions pressed forward until midday, over the whole sector of the Vesle, from Missy on the Aisne by way of Lhuys-Courville on the Ardre as far as the northwestern fort of the fortress of Reims. The objective was thus reached after a day and a half's fighting. But in the ardour of the pursuit the troops stormed on without orders, though in agreement with the intentions of the higher command, in order to improve their success by determined pursuit. The order given by the Supreme Army Command at noon of the 28th to continue the attack as far as the line of heights S.W. of Soissons–Fère-en-Tardenois–the heights S. of Coulonge, reached the troops when they were already storming forwards. On the right wing of the VII. Army, the VII. Corps had already joined the attack on May 28 without waiting for the completion of the preparations begun at this point. Here, however, the resistance was so

obstinate that it was only in the course of May 29 that the dominating heights at Crecy-au-Mont were captured.

On the following days the VII. Army pushed forward with its centre in a southern direction as far as the Marne. The right wing of the I. Army, which had extended the attack towards Reims on the left, pressed forward between the Marne and the Vesle against the wooded hills of Reims, but soon met here with unconquerable resistance, as strong French reserves had been placed on this front. The right wing of the VII. Army took Soissons, and between the Aisne and the Marne gained ground towards the heights S.W. of Soissons, and up to the eastern edge of the wood in Villers-Cotterêts.

On the 29th the occupation of the important road and rail centre of Soissons as well as of Fère-en-Tardenois was of tactical importance. In both places immense masses of material fell into the hands of the Germans, especially in the wooded country at Fère-en-Tardenois, where they captured a vast dump of French and American munitions, pioneer and transport material, which the French had not succeeded in removing in time in spite of a violent counter-attack. On the left wing on this day Reims, against the N.E. front of which the VII. Reserve Corps of the I. Army had advanced to the attack, was so surrounded with the German troops that all the roads and railways leading from Reims to the Marne lay under German fire.

On May 30 violent counter-thrusts by the French had held up the advance of the German right wing, while the German centre in a rapid advance had by midday reached the heights of the northern bank of the Marne between Château-Thierry and Dormans, on the possession of which the use of the important stretch of rail Paris-Epernay-Châlons depended. On both days the pursuing German troops had passed beyond the objectives fixed by the Supreme Army Command, so that they reached the Marne earlier than it had been thought possible. A further advance of the centre, pushed out southward like a wedge, beyond the Marne seemed to involve great risk so long as the German wings on the E. and W. had not won further ground and so broadened the base of attack.

On May 31 instructions went out from the Supreme Army Command not to penetrate farther S. over the Marne, but to extend the successes against the wooded heights of Reims and up the Marne towards the W. in the direction of Villers-Cotterêts, so as to ensure above all the secure use of the railway line leading E. of Soissons from the Aisne to the Vesle valley, and to be able to give effective tactical support to the later attack by the XVIII. Army over the Montdidier–Noyon line, for which plans had been made.

On May 30 and 31, and particularly in the first days of June, strong counter-attacks were made by the French, with the strong reserves assembled in the district S.W. of Reims and S.W. of Soissons, plainly with the intention of pressing in the flanks of the German advance. All these attacks were nevertheless bloodily repulsed, as were the American attacks a few days later against Château-Thierry, which had fallen into the hands of the Germans on the 31st.

In the first days of June the fighting became steadily more severe, as the Allied resistance, reënforced by an uninterrupted flow of fresh divisions, grew more obstinate and the counter-attacks progressively more violent and extended. The Germans therefore succeeded in gaining only little ground. The powerful impetus of the German attack had come to an end.

According to orders sent on June 7 from the Supreme Army Command, the VII. Army was, indeed, to continue to press forward slowly on both sides of the Aisne, but was otherwise to stand on the defensive; the I. Army was only to carry the attack farther where a gain of ground seemed necessary to reach a tactically more favourable position. The following days saw a series of local engagements extremely costly for the French, in which individual places, heights and tracts of ground changed hands many times without yielding definite success. On June 17 the German armies stood with their right wing and centre roughly on the line Noyon–Fontenoy, the eastern edge of the forest of Villers-Cotterêts, Château-Thierry, and up the Marne to Verneuil; the left wing had penetrated to the outlying woods W. of the wooded heights of Reims, and close to the W., N. and E. front of Reims, which was closely encircled. In view of the unexpectedly rapid advance of the centre of the VII. Army the strategical situation was unfavourably affected by the fact that the capture of Reims had not been effected; this made difficult the bringing up of drafts for the sections of the VII. Army pushed forward to the Marne, because of the lack of sufficient railways.

The tactical result of the battle of Soissons–Reims for the Germans was great beyond all expectation. Over 65,000 prisoners fell into their hands. The booty included about 700 guns and 2,500 machine-guns; in addition the French and English losses in *matériel* were enormous. The success was due primarily to the spirited attack of the infantry, the equally brilliant preparation and execution of the artillery attack and the complete surprise of the French and English. By the very clever maintenance of secrecy the French command was so successfully misled that they kept their reserves assembled at the wrong place. Thus it was possible by an attack with narrowly limited aims, carried out by relatively weak forces, to develop an operative success which ended in a substantial weakening of the fighting force of the Allies. Gen. Foch had been compelled to bring up gradually against inferior German forces more than 50 divisions. The German losses on the other hand were small, so that the exhaustion of force on the French and English side was far greater than on the German. (H. v. H.)

VI. The German Offensive of July 15 1918

The preceding German offensives of 1918, the Somme, the Lys and the Aisne-Marne, had left the German army with three salients projected from its main line on the western front, salients costly to hold and dangerous because the means were lacking properly to entrench them and the communications were deficient, both in roads and railways. Particularly was this true of the Marne salient. To push the attack on Amiens was obviously the desirable strategic course, but owing to the difficulty of organizing an attack there, and to the massing of Allied reserves behind that part of the front, it offered little chance of success. Ludendorff consequently turned his attention to pushing forward the Lys attack. But the nature of the terrain and the activity of the British artillery and aviation made the accumulation of the necessary *matériel* a difficult, slow and costly undertaking. Early in July it had become apparent that Crown Prince Rupprecht could not be ready before August. Something had to be done in the meantime to preserve the initiative. The attack in the Champagne was Ludendorff's solution of the problem. The Allied front in that sector was known to be weakly held. A successful attack there would not only ease the difficulties of communication in the Marne salient but might lead to the evacuation of Verdun, giving the Germans an additional and much-needed railway line for the supply of their armies in France. An additional result hoped for was the withdrawal of Allied reserves from N. to S., facilitating the German attack in Flanders planned for August.

The date set for the attack was July 12, but delays in the preparations deferred it to the 15th. The plan called for the VII. German Army to force the crossing of the Marne between Jaulgonne and Verneuil (20 km.), gain the heights S. of the Marne and advance eastward by both banks of the river on Epernay. Fifteen divisions were disposed for the attack on a front of 36 kilometres. The I. and III. German Armies, E. of Reims, were to advance southward on Châlons-sur-Marne, connecting with the VII. Army near Epernay. Their front of attack was 44 km., for which they employed 15 divisions in the front line and 10 in reserve. No attack was to be made about Reims itself since that city was bound to fall if the other attacks succeeded. On the French side the I. and III. German Armies were opposed by the IV. French Army of Gouraud; the VII., in the sector of attack, by the V. Army of Berthelot and the VI. of Degoutte. These French armies consisted in the main of worn or second-class troops but were fairly compactly disposed and were reën-

forced, that of Berthelot by one British and two Italian divisions, and those of Gouraud and Degoutte (in the sector attacked) each by an American division. As a factor of strength on the French side it should be noted that Gen. Gouraud had exceptional prestige and influence with his men. In the matter of intelligence service the French staff had learned its lesson from the bitter experience seven weeks before in the surprise attack on the Chemin des Dames. In spite of the utmost endeavour of the Germans to maintain secrecy regarding their preparations for attack, every phase of them was sought out, chiefly through air observation, plotted on maps and carefully studied to determine the time, place, extent and method of the next German effort. The information thus gained was supplemented by statements of prisoners so completely that not only were the approximate time and place of attack known to the French more than a week in advance, but on the eve of attack even the time of artillery preparation and of infantry assault were learned.

The French plan to meet the attack was to abandon their front lines, leaving in them only small detached posts backed by occasional wired strong points, and to take up a position far enough in rear to be beyond the ready interference of the German artillery, thus causing the superior German artillery to waste its preparatory fire on virtually abandoned trenches and neutralizing its influence on the infantry combat. The execution of this plan in the sector of the IV. Army was greatly favoured by the existence, several kilometres in rear of their front lines, of a complete system of trenches which had been carefully constructed and occupied during preceding years. It was from these rearward trenches that the French had advanced in 1917 to gain their present lines. Thus not only could the army change its position back to them swiftly and secretly, but the Germans could have no means of learning, by direct observation, that such a shift had been made.

The battle began on the 15th shortly after midnight, according to the German plan, with an intensive artillery and trench-mortar fire on the French trenches believed to be occupied. In the IV. Army sector of Gouraud, thanks to his dispositions, little damage was done to the personnel, though the abandoned trenches were mostly wiped out by the gruelling fire. In the other sectors under attack, while the same policy prevailed in theory, there does not appear to have been the same consistency in its execution and some of the Allied troops suffered severe losses. The French counter artillery preparation had begun an hour before midnight, but, owing to the relative weakness of their artillery arm, and the rearward positions taken up by the IV. Army, does not seem to have made its influence felt. The infantry advance began at 4:15 A.M. In the sector E. of Reims the assaulting troops, preceded by a barrage, walked almost unopposed through the abandoned French position except that the French artillery constantly increased the intensity of its fire. After the German protective barrage had been lifted, to enable the infantry to pass beyond its limits, the real battle began—fresh French infantry in a prepared position well supported by guns, against unsupported German infantry in the open. The Germans tried to bring up some accompanying guns, mostly by hand, but without success.

As to position it was a drawn battle, but the heavy losses completely discouraged the Germans. During the night they attempted to reorganize their attacking line and arrange artillery support and thereby to renew the assault on the 16th, but the attempt proved abortive, and by noon Ludendorff had ordered its abandonment and directed the troops of the I. and III. Armies to be redisposed for the defensive.

In the VII. Army sector of attack the Marne was successfully forced, and, except in the sector occupied by the American division, the heights on the S. bank were occupied to a depth of 5 kilometres. The direction of attack was then shifted eastward on Epernay, but being beyond the range of effective artillery support from the N. bank, and not being able to get artillery across the river to any material extent, the attack soon slowed down. North of the Marne the attacking troops soon encountered the deep ravines and rocky, forested heights of the mountain of Reims. Progress was made in the Marne and Ardre valleys; but on the wooded heights, where effective artillery support of advancing troops was impossible, the attack was easily checked. On both banks of the Marne the attack was renewed on the 16th in the direction of Epernay, with resulting slight gains of ground, and again on the 17th without result except increasingly heavy losses for the attackers. On the afternoon of the 17th, on orders from German G.H.Q., the VII. Army also passed to the defensive and the battle came to an end.

As an incident of the battle S. of the Marne might be mentioned the defence of the sector S. of Jaulgonne, which has been termed the most brilliant single feat of American arms in the war. The 30th U.S. Infantry, under Col. Butts, had prepared for the attack by building numerous trenches for the German airmen to photograph and for the artillery to register on, and more numerous rifle pits and machine-gun nests carefully camouflaged or concealed. By day the trenches were occupied, by night the rifle pits. The German artillery preparation had wiped out every trench, but the infantry in its pits and nests, despite heavy losses, accounted for more than its numbers in German dead and turned back the attack of a division.

The result of this battle was the beginning of a great moral reversal which was to find its completion in the ensuing counter-attack at Soissons. Until the attack of July 15 the Germans had been confident of success. The attack showed them that they could no longer command it. The Allied troops, on the contrary, were buoyed up by the fact that not only had a way been found to stop the German attacks, but they had been stopped with far lighter losses to the defenders than to the attackers. From a tactical point of view it may be said that the German attack had all the strength and all the weakness of the German war machine. The general staff had invented a stereotyped normal attack which was here applied on the western front for the fourth time, virtually without change of method. The same artillerist travelled from front to front, to conduct the artillery battle. Infantry units received identical training. The system produced a powerful onslaught, but killed independent initiative and discarded participation in the planning by subordinate commanders. Its failure in the Champagne may be ascribed to its inherent inapplicability to the situation and to the terrain. German G.H.Q., preoccupied by German internal questions—Russian, Austro-Hungarian and many other problems,—had not the time nor the patience to study out the special requirements of the Champagne problem, nor did it permit subordinates to make the plans. The same rigid point of view speeded the military downfall of Napoleon.

On the Allied side great credit must be given to Gen. Pétain and Gen. Mangin for their skilful measures to foil the German plan after it had become known. The Germans were superior in numbers and, at the start, probably had higher *moral*. The victory was on the side of superior leadership, both higher and lower. (A. L. C.)

VII. The Allied Offensive of July 18 1918

On July 18 1918 the Allies regained the initiative, and the offensive passed to their hands, thereby assuring them of victory. It is generally thought that the aim of the attack carried out on that day by the French X. Army was to clear the front of the IV., V. and VI. Armies, which had been attacked since July 15, and that this had indeed been its first result. Herein lies a double error. At first, the success gained on July 15 by the IV. Army under Gouraud had, by checking the I. and XIII. German Armies, nullified the success of their VII. over the V. Army under Berthelot and Degoutte's VI. Army, a success which, being limited, was dearly bought. Ludendorff informs us that after July 17 he issued orders to those elements which had established themselves on the left bank to recross the Marne; this difficult withdrawal was due to take place on July 20. He gave up the idea of renewing the attack on Reims, which would necessitate the immobilization of powerful forces for a subsidiary venture. Accordingly, he diverted all his strength towards Flanders, where a new offensive on a large scale was

developing. He went personally to Avesnes, where headquarters were, in order to supervise the preparations. The French attack of July 18 had not then as its result the stopping of the German attack. This was, moreover, not the aim of this Allied offensive. There was no question of a counter-attack, but of an operation thought out and prepared for its own ends, independent of the German offensive.

Gen. Mangin had taken over command of the X. Army on July 16 in place of Gen. Maistre. The latter had twice stopped the German advance between the Aisne and the Ourcq, and had, in a small operation on June 15, recovered nearly the whole of the ground lost on the 12th and 13th. It immediately appeared evident to Gen. Mangin that he now found himself in command of the X. Army under conditions similar to those that he had just left on the Méry-Courcelles plateau. Now, in his operation orders of June 10, ordering the counter-attack for the following day at "1100 hours" (11 A.M.), Gen. Mangin concluded with this sentence, which he wished to be communicated to the troops: "To-morrow's attack should mark the end of the defensive battle which we have been waging during the last two months; it should mark the checking of the Germans, the resumption of the offensive, and lead us to success."

After having saved Compiègne and stopped the German advance, the counter-attack of Méry-Courcelles had been stopped by the French High Command, owing to lack of available forces, but when Mangin found himself on the W. flank of a pocket of much larger extent, he immediately studied with his new staff the question of its reduction, to follow up with an offensive and finally to grasp from the enemy the initiative of the operations. On June 18 he received instructions to examine under what conditions the communications to the S. of Soissons could be disturbed: firstly by aerial bombardment, secondly by a rapid advance from this front, which would enable him to place his heavy batteries in a position which would command the bridges of Soissons and the main exits of the town. On the 20th he sent his estimate of his requirements in infantry and artillery to carry through this operation, from which he foresaw a rapid extension southwards; and he asked the Command to consider how the success could be turned to advantage.

In order to start under good conditions, he suggested a series of minor operations which were intended to improve the positions from which he would attack. Without further delay he started carrying out his scheme, and vigorously pushed forward his preparations on the front of attack. Numerous battery emplacements and ammunition dumps were established.

All the ambulances and clearing stations, which had been placed so far back with excessive caution, were brought forward to within a reasonable distance, which would enable the wounded to be dressed without inflicting on them the miseries of transport. Minor operations followed rapidly one after the other on the front of this army, and enabled him to ascertain the degree of exhaustion of the German troops, whose heavy losses had only partially been made good. On June 28 a slightly more important advance considerably improved the situation, and 1,000 prisoners were taken. On the 29th Gen. Mangin received Gen. Pétain's letter approving of the plan of action, which had already started to be put into execution, and which was agreed to also by the High Command, whose approbation had been obtained through liaison staff officers.

The X. Army's front likewise was improved to the N. of the Aisne by a minor operation, in which, on July 3, 1,100 prisoners were taken. It was indeed important not to draw the attention of the enemy to the position of probable attack, and it was clear besides that, having attacked eastwards, the X. Army would be called upon to attack in a northerly direction. Gen. Mangin was able to write on July 3: "The minor operations undertaken by the X. Army during the second fortnight of June have been carried out very easily. Without attaching to them more importance than they deserve, the proof can be seen that the enemy experienced the same difficulties as we do in defending himself against troops making use of methods of actual attack. There is ample reason for thinking that an attack carried out on the plateau to the S.W. of Soissons, under conditions which were outlined in the scheme of June 16, would present not only the best chance of success, but could also bring about such a development that would result in the immediate exploitation of the factor of surprise and would lead to the elimination of the Château-Thierry pocket." The factor of surprise was now quite possible. On the one side the forests made it possible to conceal until the last moment the manœuvres by which the infantry were placed in position; on the other side the incessant movements of artillery which had taken place during the last three weeks on the X. Army's front would probably prevent the enemy from noticing the installation of new batteries in the Villers-Cotterêts region. General Mangin asked for the selection and putting in position of all forces necessary to enable him to carry out the intended offensive.

On July 8 a further operation improved the position of the X. Army to the S. of the forest of Villers-Cotterêts. On July 9 Gen. Mangin received a letter from the commander-in-chief approving of his plans. It made no further mention of the elimination of the Château-Thierry pocket, but it said:—"Undoubtedly this operation not only presents the best chance of success, but it can be profitably exploited. Further it constitutes a most efficacious demonstration against the German offensive." From now onwards it was necessary to prepare for the operation in the greatest detail, in such a way that the concentration of forces and the launching of the attack could succeed one another within a very short time—four days as a maximum. The concentration must be ready to start on July 15.

From July 9–13, the situation continued to improve to the S. of the Villers-Cotterêts forest. The Savière valley, which presented a serious obstacle in that area, was taken. On the 13th, Gen. Mangin, in pointing out these results, declared that these minor operations, which had been carried out at very small cost, had been sufficient to exhaust the five German divisions opposing him. They were replaced by other divisions, which only a short time before had been withdrawn from the front and had not had time to rest or reorganize; their strength having been reduced to 40–50 men per company instead of 150. The enemy was considerably weaker after these reverses; the instructions which were issued to sector commanders, and which were captured, were quite clear:—"Hold on at all costs, without hoping to be reënforced; the bulk of the German army is being kept in reserve for the great offensive." Accordingly, the situation was favourable for an attack.

The X. Army now consisted of 16 divisions, 10 of which were in the first line, with 780 guns, 530 heavy guns, 132 long-range guns. Except for the latter the means at disposal were inferior to those available for previous offensives, but the force had only hastily gathered formations opposing it, and the factor of surprise was being counted on. Finally, telegrams dispatched July 13 fixed the launching of the attack for July 18, and the beginning of the concentration for July 14.

On July 15, at "0900 hours" (9 A.M.), important moves of concentration which had been commenced two days previously and were to be carried through on the following days were interrupted by order of the French C.-in-C., owing to the German offensive which had just started on the front of Gouraud's IV. Army. Gen. Foch, however, as he was visiting the headquarters of the army groups, heard of this counter-order and annulled it. The preparations, which had been suspended for some hours, were resumed—but so quietly that the enemy, who had thought up to the 11th that an attack was probable, had meanwhile been completely reassured. "The troops had ceased thinking that an attack would come," said Ludendorff; "one of my friends, a divisional commander, told me that from the 17th he had been in all the first lines and had gained the impression that profound quiet reigned in the lines of the enemy."

The Offensive.—On July 18 at "0435 hours" (4:35 A.M.), the X. Army hurled itself against the enemy between the Aisne and the Ourcq on a front of 25 km. without any sort of artillery preparation. Three hundred and twenty-one tanks accompanied the infantry over all places where it was possible to go; they

were preceded by a dense barrage, whilst counter-battery work was vigorously carried out. The Germans were completely surprised. The first lines were thrown into confusion in the twinkling of an eye, exposing the batteries, which were captured. An advance of 8 km. was made with particularly brilliant results in the centre, where the 1st and 2nd American Divs. coöperated with Dangan's Moroccan Div., some of the best storm troops.

On the river N. of the Aisne a little artillery preparation lasting three-quarters of an hour had been found necessary against a strong opposition. The 162nd Div. under Messiny had on their side attained the objectives which secured the flank of the main attack.

To the S., after a short artillery preparation, the VI. Army under Degoutte had likewise gone forward in a brilliant manner. On the left the rapidity of its advance had assisted the right wing of the X. Army, whose progress had been held up in the dense woods. It attacked without reënforcements, with its divisions in line, and was reënforced gradually by the American divisions which infused a new spirit into the troops and called forth a lively emulation. On the first day, 10,000 prisoners and 200 guns were captured by the X. Army, and 2,000 prisoners and 50 guns by the VI. Army.

Meanwhile Gen. Pétain went with Gen. Fayolle to the post of observation where Gen. Mangin was following the development of the battle. General Pétain considered that the results obtained exceeded his best hopes, but that their exploitation was necessarily limited by the means at his disposal and by the general situation; he took into consideration that the enemy was on the S. bank of the Marne. No more reënforcements could be sent to the X. Army, and from now onwards it had to organize itself in depth in such a way as to be able to maintain itself, relying on its own resources, on the ground conquered. But Gen. Foch, warned by Gen. Mangin, gave orders for the advance to be continued. On the following day the X. Army was informed that four new divisions had arrived, two of which were British divisions taken from the reserves at the disposal of the Allied C.-in-C. Gen. Fayolle expressed the same view as Pétain's to the commander of the VI. Army, but the attack likewise continued on that part of the front.

The struggle continued. The VII. German Army had brought into action its three divisions in reserve, which were promptly reënforced by two more. The Germans recovered, and the struggle became intense. Having been compelled to give up his offensive in Flanders, Ludendorff sent to the Aisne all those divisions given to the Crown Prince of Bavaria. The X. French Army fought over open country against troops at least equal in number to their own and sometimes superior. The American divisions had been withdrawn; some gun crews had asked and obtained permission to prolong their stay with the French troops; they made use of the heavy guns captured from the enemy and they appeared to think it their duty at least to send back the supply of gas shells, which was considerable.

The British divisions came into the battle at the most difficult moment. The 15th Scotch Div., under Gen. Reed, covered itself with glory in the attack on the *château* and park of Burzancy on July 28. The 34th British Div., partly composed of units which had come back from Palestine and were new to the fighting in France, surpassed all expectations when they took part in the attack on Grand Buzoy on July 29. On Aug. 1 this ridge, which overlooked all the country between the Ourcq and the Vesle, was carried by the X. Army.

The importance of this success was lost sight of at headquarters, and on the night of Aug. 1–2 the commander of the group of armies, who was anxious to husband his troops, wrote:—"The X. Army will continue to act on the right in the direction of d'Arcy-Ste. Restitue; on the rest of its front it will maintain a defensive attitude. The forces which are in front of it are obviously of equal strength, and the only chance of making any headway is by dealing a succession of local blows, prepared in detail and always planned according to the capacities of the reduced force at its disposal. These forces will be further reduced when the expected withdrawal of the British divisions takes place." But the continued pressure on the enemy led to quite another result, and the general commanding the army sent the following telegram which was to be immediately communicated to the troops on the whole front:—"Forward! The victory of August 1st consummated that of July 18th and has ended in pursuit. The roads are terrible, but if it is raining for us it is also raining for the Boche. Press hard on their heels, hustle them and break through the feeble centres of resistance when they will try to hold up your victorious advance. This evening the X. Army must be on the Vesle."

At "1900 hours" (7 P.M.) the *chasseurs* of Villemot's division entered Soissons. The Aisne, as far as its confluence with the Vesle, and the whole course of the latter river, had been reached by the X. Army on Aug. 3, and by the VI. Army on the 4th. The I. American Corps under Gen. Liggett, which had gradually been brought into action during the battle, had taken an increasingly important part in the operations of the VI. Army, which included as many as six American divisions. The V. Army under Berthelot had attacked under most difficult conditions, as it had reëstablished its front after some days' hard fighting, during which it had been compelled to give way a little; but always holding on to the Reims mountain. Although the V. Army had very difficult ground to cover, it arrived at its objective on the Vesle.

The Results.—Gen. Mangin was able to say thus to his troops:—"You have captured 20,000 prisoners, including 527 officers, 518 guns, 300 *minenwerfer*, 3,300 machine-guns, parks and ammunition dumps and everything that a large army compelled to retreat precipitately had to leave behind it. You have even taken back from the enemy the depots where he had gathered together the results of his thefts. You have saved from pollution by these civilized barbarians, Soissons, Valois, the whole of the isle of France, the cradle of our nation, with its harvests untouched, and its ancient forests. You have removed from Paris a most presumptuous menace and have given to France the consciousness of victory. You are most worthy of your country."

From the German point of view, this victory as a first result prevented the proposed offensive in Flanders, the preparations for which had already been started on the 16th. Reserves intended for this offensive had been used up between the Marne and the Vesle, where they had been exhausted to such an extent that their normal reorganization had become impossible.

"As in every battle," said Ludendorff, "the losses have been considerable in the engagements fought since July 18th. The 18th July in particular and the defensive engagements which followed cost us very dearly, although we had been able to recover our wounded, and the number of our men who had been taken prisoner was not great." (He ignored, however, the number of 30,000 for the X., VI. and V. French Armies.) "The losses in the struggle were so important that we decided to break up about 10 divisions, 3 to assign their infantry as reënforcements to the other divisions."

Ludendorff, who with commendable care kept a record of each operation and generally drew therefrom very wise conclusions, had only been moderately well informed on the last battle. He thought that it had been preceded by a short and heavy artillery preparation and by clouds of gas, all of which was pure imagination; he also pretended to discover a new invention. "Tanks were seen to be used for the transport of troops. They crossed our lines, and after unloading the occupants, who formed nests of machine-guns in our rear, returned to find further reënforcements." The passenger tank, however, still remained to be found.

The presence of the 1st and 2nd American Divs., which attacked so brilliantly near Vierzy and Dommiers, themselves capturing 7,200 prisoners and 21 guns, appeared to have escaped Ludendorff altogether. He had the temerity to write:—"The six American divisions which took part in the battle suffered heavily without obtaining any results."

Further, the reasons which he gave for giving up the offensive in Flanders were surprisingly indifferent. "The enemy had

every opportunity of being prepared for the offensive. If he gives us the slip as he did to the east of Reims we would be unable to obtain a decision. Should he resist, his numerous reserves were in a position to stop us as on the 10th and 11th of June in the direction of Compiègne." Ludendorff appeared to admit that the mere fact of establishing a protective zone in front of a defensive position made it impregnable. His *moral* was affected as seriously as that of his troops. (C. M. E. M.)

VIII. The Allied Offensive of Aug. 17–20 1918

Even before the French X. Army had reached the Vesle and the Aisne, the continuation of the offensive on the N. bank of the Aisne had been considered. The preparations for this scheme were taken in hand during the advance of the IV. British Army under Rawlinson and Debeney's I. French Army, which began on Aug. 8. Marshal Foch thought that the progress of this offensive would cause the Germans in front of the III. Army under Humbert to retreat, and then those opposing Mangin's X. Army. Foch then considered that the two armies could attack in succession in order to cover the right flank of the Franco-British advance, thus widening the front of this battle. In the operation plan of the X. Army it was expected that the attack would bring them into position along the Oise and the Aisne, and then, all efforts being concentrated on the right, the attack, facing E., would ensure egress from Soissons and would thus be developed in such a way as to outflank the position of the Chemin des Dames.

The British attack, however, met with steady resistance; the ground cost them more and more dearly, and was no longer proportionate to the losses in men. In explaining this state of affairs to Marshal Foch, Sir Douglas Haig pointed out that he would provisionally suspend his attack, which had been so brilliantly started on Aug. 8 to the S. of the Somme, but he would renew the offensive farther to the N. by two successive operations, the first of which would start on Aug. 20 against Arras. Marshal Foch informed Gen. Fayolle, commanding the group formed by the I., III., and X. French Armies, of the decisions, and asked him when his armies would be ready to renew their attack. On Aug. 16 Gen. Fayolle, in discussing this matter with Gen. Mangin, informed him that the I. and III. Armies were not in a fit state to attack, and that consequently the X. Army, whose effectives were not sufficiently strong to attack unaided, should content themselves with small local demonstrations. This was not the opinion of Gen. Mangin, who was convinced above all of the necessity of continuing the offensive. He said that the X. Army was ready to attack on the 18th with 11 divisions in the first line and 3 in the second line (3rd, 11th and 14th Inf. Divs.), but that he proposed to postpone the operation to the 20th, as the new British attacks were due to start on that day. He carried his point, though he had not sufficient artillery at his disposal for this attack: 1,138 guns, including 324 75-mm. guns, 540 heavy guns, and 274 long-range guns. This artillery strength, it is true, appeared weak in view of the extent of the front which had to be attacked, but the moment had arrived to set aside calculations based upon past experience and to consider the shaken condition of the enemy whose power of resistance had very much diminished.

The Offensive.—Before the front of the X. Army the enemy had his chief line of resistance at a distance of between 2 and 3 km. from the front trenches. This scheme of defence, which was in accord with the ideas adopted by both sides, had enabled Gen. Gouraud's army to carry out its magnificent resistance on July 15th, and the numerous prisoners taken had disclosed all the details of the scheme.

On Aug. 17 and 18, the divisions in line had seized all the covering zone, and had even gained a footing in a certain part of the line of resistance, taking over 2,000 prisoners.

From the evening of the 18th to the morning of the 20th, for 36 hours, all the artillery was pushed forward in order to be able to support the advance of the infantry as long as possible without changing position. In the orders for attack it was laid down that, after the capture of the two enemy positions, the infantry should be reformed at the foot of the slopes and should then push on as far as the banks of the Oise and Ailette. Gen. Fayolle had not wished that positions should be established in the valleys, where, as he remarked, trenches in marshy ground would be difficult to occupy during the winter; but the hour for such anxieties had evidently gone.

From the 17th, artillery preparations against the second German position had continued without stop. On the 20th, at "0710 hours" (7:10 A.M.), the X. Army attacked, and all the German positions were captured. On the 21st, the French came into position against the support divisions which had been brought up to attempt to reëstablish the situation, and on the 22nd they reached the Oise and the Ailette.

Gen. Mangin said:—"The time has come to shake off the mud of the trenches." It was so. Ludendorff tells us with regard to these events that, in spite of all preparations, the battle had taken an unfavourable turn; the nerves of the German army were strained; the troops did not everywhere stand against the heavy artillery fire and the assaults of the tanks. "We received in this a fresh warning. We had suffered our more heavy and irreparable losses. The 20th August was also a day of mourning. In truth, it encouraged the enemy to continue his offensive. I calculate that the enemy offensive will continue between the Oise and the Aisne in the direction of Laon. The direction of the attack was well chosen, as the position of the XVIII. Army to the N. of the Oise and that of the VII. Army to the N. of the Vesle should be made untenable thereby. The enemy maintained a strong pressure against the Soissons-Chauny line. Very severe engagements were fought here, marked by cruel alternatives if unsuccessful. One could not yet say what would be the issue." It is interesting to compare these remarks of Ludendorff with the considerations that influenced Gen. Mangin in bringing about his attack. These were:—(1) that the employment of great forces between the Oise and the Aisne was justified for the reason that this region would always be the pivot of the manœuvre; (2) that the enemy sought to reëstablish his position in making use of each of these lines in succession—(*a*) the Aisne, (*b*) the Hindenburg line (Chemin des Dames), (*c*) the Ailette, (*d*) the Serre; and (3) that the hinge of enemy movement would always be approximately on the axis Soissons-Laon. Thus it was vital to apply the maximum force possible in this region in order to smash the hinge, and to compel successive withdrawals on each wing which would assume growing importance.

The advance of the X. Army facilitated that of the III. Army towards the Lassigny *massif*, and both armies joined up on the Oise. The X. Army continued to press eastwards between the Ailette and the Aisne. In spite of a strong resistance the advance was carried on by successive assaults. On the 30th, the 32nd American Div. under Gen. Ham captured Juvigny in brilliant fashion. During Sept. 4 and 5 the Germans gave up the Ailette and the Vesle, and retreated to the borders of the Coucy forest. Between the two it only remained to capture the Laffaux position which linked them up. The X. Army only possessed weak effectives in infantry, artillery, and even in munitions; nevertheless, on Sept. 14 the I. Corps under Lacapelle and the XXX. Corps under Penet broke into the Hindenburg line on the Laffaux plateau, taking 2,400 prisoners.

The attack developed during the succeeding days, and the advance continued towards the Chemin des Dames, in spite of German counter-attacks; it was only stopped on the 20th upon the order to "organize on the ground taken in such a way as to hold on to the advantages won and to take every step to cut down losses and prevent fatigue with a view to be in a position to pursue the enemy should he retreat."

But the general attack had begun. In the centre of the vast line, the X. Army hustled the enemy, who was beating a retreat; it reached the Ailette, and then changing front on the right threatened the Chemin des Dames to the E.; its right seized this redoubtable position after having crossed the Aisne; the Italian Corps under Albricci overcame all obstacles with great dash and reached the Ailette in its turn. On Oct. 12 the enemy

was surprised in the middle of his preparations for a retreat, which he had intended to carry out the following day. He was hustled without respite along all the front of the X. Army before he had time to complete the destructions which he had prepared. The St. Gobain *massif* was taken and Laon at last freed. The X. Army advanced 18 km. in 36 hours.

On Oct. 15 Gen. Mangin addressed his troops:—

"You have won the battle of the Ailette. On the N. bank of the Aisne the enemy waited for your attack after your victory at Soissons, and he had withdrawn still farther his line of resistance. On the 17th and 18th you defeated his advanced posts; and then on the 20th, after your strong artillery had been brought up, you defeated him on the field of battle which he had selected himself; you have pursued him beyond the Oise and the Ailette. After the 29th of August, the struggle became fiercer, the front facing E., for the conquest of those plateaux which overlooked Soissons. It was necessary to conquer them step by step after having crossed the Aisne and the Ailette by means of force. There you defeated the best divisions of the German army, who exhausted themselves in defending the approaches to the Hindenburg line. On September 14th, the Laffaux mill was carried by assault and the Hindenburg line crumbled right up to the Ailette on an 8-kilometre front. In vain did the enemy, by bloody counter-attacks, attempt to retake that important position. You have not ceased to advance and have driven him back, compelling him to abandon the line of the Vesle. On October 1st, after you reached the Chemin des Dames, he has been forced to retire, in front of your left, to the Ailette. In the meantime the victorious advance of the Allied armies on your right and on your left threatened the communications of the German armies in position before you and they had to withdraw. You were waiting for this moment, on October 12th, surprising once more the enemy in the very act of moving. With your right and centre you crossed the Ailette, and with your left you seized the borders of the St. Gobain forest, and with a single bound, breaking the resistance of the rear-guards and then hustling them, you have covered 18 kilometres in 36 hours. This was done fighting and in spite of forests and marshes and a most thorough destruction of roads and bridges. You have captured 26,000 prisoners, more than 400 guns and an immense quantity of war material that can never be replaced. Laon, ancient city of communal freedom, and 10,000 French whose joy is for you a wonderful reward, have been freed from the most terrible slavery that has ever weighed upon the human race. The pressure of the adjoining armies has caused the enemy to retreat before you; the position which you have just taken forces the enemy to retire before them. Thus the hour of deliverance and justice draws near, with the punishment of the perjured, shameless thieves, murderers of our wounded, butchers of women and children, who must expiate their crimes and build up with their hands the ruins brought about by their insensate ferocity. But you have done nothing since. There remains more for you to do, as the sacred soil of our country is still fouled by the unclean foreigner, as thousands of Frenchmen are still in slavery, and since the world is awaiting its salvation through your courage. Soldiers of Freedom! Forward!" (C. M. E. M.)

CHANTAVOINE, HENRI (1850-1918), French man of letters (*see* 5.847*), died at Galuire (Rhône) Aug. 15 1918.

CHAPLIN, HENRY CHAPLIN, 1st Viscount (1841–), English statesman (*see* 5.852), was generally welcomed on his return to the House of Commons in 1907 as a type of parliamentarian fast disappearing. He intervened with effect on questions of land and of social and tariff reform, but otherwise was not so prominent in debate as in past years. As a thoroughgoing Tariff Reformer, he deplored the change of policy with regard to food taxes which was forced on the Unionist leaders in the winter of 1912–3. When the first Coalition Government was formed in May 1915, he was left the solitary conspicuous Unionist on the Opposition front bench; and it was felt to be a fitting close of a distinguished career in the Commons when at the age of 75 he was raised on the recommendation of that Government to the peerage in April of the following year.

CHARLES (Karl Franz Josef) (1887–), Emperor of Austria and King of Hungary from 1915 to 1918, was born Aug. 17 1887 at Persenbeug in Lower Austria. His father, the Archduke Otto (1865–1906), the younger brother of the Archduke Francis Ferdinand, was a clever man of easy morals; his mother, Princess Maria Josepha of Saxony (1867–), was a zealous Catholic. Charles spent his early years wherever his father's regiment happened to be stationed; later on he lived in Vienna and Reichenau. He was privately educated, but, contrary to the custom ruling in the imperial family, he attended a public gymnasium for the sake of demonstrations in scientific subjects. On the conclusion of his studies at the gymnasium he entered the army, spending the years from 1906–8 as an officer chiefly in Prague, where he studied law and political science concurrently with his military duties. In 1907 he was declared of age and Prince Zdenko Lobkowitz was appointed his chamberlain. In the next few years he carried out his military duties in various Bohemian garrison towns. At that time no opportunity was given him of gaining a closer insight into affairs of State, although the death of his father in 1906 and the renunciation by his uncle, the Archduke Francis Ferdinand, on the occasion of his marriage with the Countess Chotek, of any right of succession for the children of this union, made him heir presumptive to the Emperor Francis Joseph. In 1911 he represented the Emperor at the coronation of King George V. in London. In October of the same year he was married at Pianore (Italy) to the Princess Zita of Bourbon-Parma. Of this marriage, which is everywhere described as a happy one, there were several sons and daughters, the eldest of whom, Otto, was born in 1912.

Charles's relations with his great-uncle, the Emperor, were not intimate; and those with his uncle Francis Ferdinand, the heir to the throne, not cordial, the differences between their wives increasing the existing tension between them. For these reasons Charles up to the time of the murder of Francis Ferdinand, obtained no insight into affairs of State, but led the life of a prince not destined for a high political position. It was only after the death of the Archduke Francis Ferdinand that the old Emperor, moved by an innate sense of duty, took steps to initiate the heir to his crown in affairs of State. But the outbreak of the World War interfered with this political education. Charles spent his time during the first phase of the war at headquarters at Teschen, but exercised no military influence.

In the spring of 1916, in connexion with the offensive against Italy, he was entrusted with the command of the XX. Corps, whose affections the heir to the throne won by his affability and friendliness. The offensive, after a successful start, soon came to a standstill. Shortly afterwards Charles went to the eastern front as commander of an army operating against the Russians and Rumanians. On Nov. 21, the day of his great-uncle's death, he succeeded to the throne.

Seldom has a ruler on ascending the throne been faced with a more difficult situation. The struggle between the nations had been going on for more than two years; for more than two years the troops of the monarchy had been fighting heroically against the superior forces of their enemies. The military and economic resources of the monarchy were beginning to fail. Behind the front, especially in the towns of Austria, there was want of the necessaries of life, and already it was clear that anti-dynastic feeling was spreading widely, especially in the non-Austrian and non-Magyar territories.

His programme on his accession was to combat this feeling, to renew the splendor of the dynasty, to give to the peoples under his rule the longed-for peace, and to bring about a settlement between the different nations composing the Habsburg Monarchy. But how was this programme to be carried out?

The Emperor Charles thought that for this purpose he needed new men; he therefore dismissed many of his predecessor's most influential advisers, and replaced them by persons from his own circle of friends and that of the late Archduke Francis

* *These figures indicate the volume and page number of the previous article.*

Ferdinand. The *Obersthofmeister*, Prince Montenuovo (1854-), was superseded by the former president of the council of ministers, Prince Conrad Hohenlohe (1863–1920); the position of head of the military chancery, which had been held during the last years of the Emperor Francis Joseph by Freiherr von Bolfras (1838-), was given to Field-Marshal von Marterer (1862–1919); Count Polzer (1870-) succeeded Freiherr von Schiessl (1844-) as head of the civil chancery. The Archduke Frederick, the commander-in-chief, was dismissed, the Emperor himself taking over the supreme command of the army, and headquarters were transferred from Teschen to Baden, near Vienna. Shortly afterwards Conrad von Hötzendorf was replaced as chief of the general staff by Arz von Straussenburg. In the great offices of State there was also a change of personnel. The position of the Hungarian prime minister, Stephen Tisza, was indeed much too strong for his removal to be thought of at that time, and this was not effected till May 1917. But the Austrian prime minister, Ernst von Körber, was replaced by Count Clam-Martinitz, and the Austro-Hungarian foreign minister, Baron Burian, by Count Ottokar Czernin. These changes, however, were merely disadvantages, because the new men, with the exception of Czernin, could not free themselves from the traditional principles of government, while they lacked the experience of their predecessors.

The Emperor Charles himself had not the energy and strength of character necessary to carry out his views. Even his adherents while praising his powerful memory, his gift of rapid comprehension, his marked sense of the greatness of his House, his devotion to duty, and his personal charm, admit that he lacked the stronger qualities. His efforts for peace, which embroiled him with Germany, and his attempts to save the Habsburg Monarchy by concessions to the various nationalities composing it are described in the article AUSTRIAN EMPIRE (*Foreign Policy*).

During 1918 his attitude became more and more vacillating. Immediately after the capitulation of the Bulgarian army he announced that the various nationalities were free to sever their connexion with the monarchy, but on Oct. 16, in the hope of saving the dynasty, he issued a manifesto forecasting the conversion of Austria into a federal state, but with no mention of Hungary. This project also failed, the revolutionary elements having gained complete control in the various territories, and on Nov. 11 the Emperor, in order not to hinder the free development of his peoples, resigned all share in the government of Austria. Two days later he made a similar renunciation in the case of Hungary. The German Austrian Republic was proclaimed by the National Assembly on Nov. 12; the Hungarian at Budapest on Nov. 16. Yet Charles did not resign the crown of his dominions. He retired to his castle of Eckartsau on the Danube; thence he went on March 24 1919 to Switzerland, where he stayed first at Schloss Gstaad, and later at Prangins. His attempt at the end of March 1921 to secure his restoration as King of Hungary failed owing to the unfriendly attitude of the Hungarians and the unanimous opposition of the Succession States and the Entente.

A further and more serious attempt, on Oct. 22–24 1921, was defeated with fatal results to the ex-Emperor's chances of restoration. Having made a surprise air-flight with his wife from Switzerland to the Burgenland (where for some weeks a revolt had been organized against its transference to Austria), Charles was there joined by a small force of armed Royalists, at whose head he marched on Budapest. But the Allied Powers, as well as the "Little Entente," at once made it clear that a *coup d'état* would not be tolerated; and there was a strong rally at Budapest to the side of the Horthy Government. The Royalists, within 12 m. of Budapest, were met and defeated, with heavy losses, Charles and Zita being themselves arrested at Komorn. On instructions from the Powers, the definite deposition of Charles and renunciation of his claims to the throne were insisted upon, and he and his wife were handed over to the custody of the Allies for internment. With this dramatic failure was ended the hope of a restored Habsburg dynasty in Hungary.

(A. F. PR.)

CHARMES, FRANCIS (1848–1916), French journalist and politician, was born at Aurillac, Cantal, April 21 1848. He was educated at Aurillac, and afterwards at the lycées of Clermont-Ferrand and Poitiers, subsequently entering journalism. He rapidly made a mark as a brilliant writer, and in 1872 became editor of the *Journal des Débats*, where he remained until 1880, returning to it from 1889 to 1907. His political writings created much interest, and in 1880 the Government appointed him to the post of assistant director of the political department of the Foreign Office. In 1885 he became head of the department, and remained in the Foreign Office until 1889. From 1881 to 1885 and again from 1889 to 1898 he was deputy for Cantal, and in 1900 became a senator. Charmes is, however, best known for his connexion with the *Revue des Deux Mondes*. In 1893 he began his famous political writings in the *Revue*, and in 1907 became its editor. He takes a high place among the journalists of the third republic, and his articles and studies, both literary and political, in the *Journal des Débats* and *Revue des Deux Mondes* were one of the features of French literary history during the last years of the 19th century. He died in Paris Jan. 4 1916.

CHARNAY [CLAUDE JOSEPH], DÉSIRÉ (1828–1915), French traveller and archaeologist (*see* 5.947), died in Paris Oct. 24 1915.

CHARPENTIER, GUSTAVE (1860-), French operatic composer, was born at Dieuze, Lorraine, June 24 1860. He received his musical education at the Paris conservatoire under Massenet, and obtained the Prix de Rome in 1887. His works include *Impressions fausses* (1895); *Impressions d'Italie* (1891) and the operas *La Vie du Poète* (1892); *Louise* (1900), which, first produced at Covent Garden in 1909, has attained a wide popularity, and *Julien*, as well as *Chant d'apothéose pour le centenaire de Victor Hugo*. He founded the Conservatoire de Mimi Pinson (for working girls), and during the World War started the Œuvre de Mimi Pinson and Cocarde de Mimi Pinson to aid wounded soldiers.

CHASE, WILLIAM MERRITT (1849–1916), American painter (*see* 5.956), died in New York, Oct. 25 1916. In 1912 he was awarded the Proctor prize by the National Academy of Design for his "Portrait of Mrs. H." At the Panama-Pacific Exposition (1915) a special room was assigned to his works.

CHEMICAL WARFARE: *see* POISON GAS.

CHEMISTRY (*see* 6.33).—A retrospect, in 1921, of the further advances made in chemical science, brings to mind that it was only in 1876 that the final paragraph of the article on Chemistry in the 9th ed. of the *E. B.* referred to the then quite recent establishment of the periodic law as marking a new era. In that article the elements were dealt with in groups, in accordance with their periodic relationships. In 1902, in the supplementary article published in the 10th ed., stress was laid on the uncertainties which still attended the attempt to classify the elements. Subsequent progress has been astounding, so much so that chemistry appears, during 1905–20, to have entered upon yet another era. New methods have been introduced and a degree of certainty has been given to the primary postulates of the science, even within living memory, which could not have been contemplated as within the bounds of attainment; at the same time, old suspicions have been justified and conceptions which had long been entertained have been realized. The advance is mainly the outcome of studies in the borderland region between chemistry and physics and is due to much overlapping of inquiry.

It is always interesting to trace events to their causes. A name to be written large on the page of advance is that of the late Sir William Crookes, whose casual observation (about 1861) of a peculiar behaviour of his vacuum balance, when determining the atomic weight of the element thallium, caused him to study heat-radiation effects in low vacua and led to the invention of his celebrated radiometer (1874). He thus became interested in the improvement of the vacuum pump and was led on to pay special attention to the negative or cathode electric discharge in high vacua. His results attracted attention owing to the beauty of the demonstrations he gave; he was himself sufficiently convinced of their novelty to regard the cathode discharge as consisting of

matter in a fourth state previously unrecognized (1879). The fundamental character of the discovery was not realized, however, until it was interpreted by Sir J. J. Thomson (1897), after Röntgen (1895) had shown that peculiar pulsations (X-rays) were excited by the impact of the discharge against a solid surface.

From 1852 onwards, the year in which Frankland first made known the simple theory of atomic valency upon which hitherto all structural formulae have been based, chemists spent laborious days in verifying the Daltonian theory of atoms, itself a most wonderful prediction of genius. They have been engaged in defining atomic properties and in the comparative study of the elements; also they have been at infinite pains to elucidate molecular structure, in the hope of explaining the properties of compounds generally in terms of such structure. The work done is of colossal proportions. Success was attending their efforts in most directions; and a finished stable system was almost in prospect, when, with little notice, although the storm had long been brewing, their peace of mind was disturbed by the rudest possible intrusion from the side of physics. It is true that a note of warning came through the discovery of the radio-active properties of uranium by Becquerel; but it was not until the high-explosive shell radium was let loose that all preconceived views of atomic sanctity and sanity were scattered to the winds.

Although no one regarded the elements as strictly "elementary"—the only explanation of Mendeléeff's generalization was that they were genetically related and therefore of complex structure—it had always been supposed that they were infinitely stable, only to be decomposed, if at all, by resort to extreme measures. In radium, however, an "element" was suddenly found that was ever undergoing disruption and yet it was impossible to control its decay, either to hasten or diminish the rate. Even more marvellous was the character of the change—particularly as illustrating the dependence of molecular idiosyncrasies on structure. Radium is a metallic material, resembling barium; the first weighty product of its slow spontaneous decomposition, together with the inert gas helium, was found to be a highly volatile and inert gas emanation now known as radium (or niton) having none of the properties of a metal; this latter, however, also underwent change and very rapidly, a helium molecule being again obtruded. This downward course was progressively continued, until at last what seemed to be lead was obtained.

Radium has been proved to be but a child of uranium, the most weighty of the known primary materials (238), though produced from it at a rate far slower even than that at which radium itself commits suicide. Thorium, the oxide of which plays so great a part as chief component of the "mantle" now generally used for incandescent gas-light, has also been shown to be a member of the Suicide Club (*see* RADIO-ACTIVITY).

Faraday, who early made clear the essential unity of chemical and electrical action, in the researches in which he laid the foundations of electro-chemistry, discovered that, in electrolysis, definite electric charges were carried by the moving atoms of matter; gradually the view grew up that the charge carried by the atom was related to the principal valency of the element. After a considerable interval, Helmholtz, in his Faraday lecture to the Chemical Society (1871), sought to draw the logical conclusion from Faraday's facts: he pictured chemical combination as the consequence of atomic charges of electricity and chemical interaction as involving the exchange and neutralization of such charges. Johnstone Stoney, in 1881, baptized these charges electrons. The hypothesis did not altogether satisfy chemists, more particularly on account of the strange variations in the valency of some elements and because it did not seem to afford an explanation of so-called residual affinity. The chemist, be it said parenthetically, ever has the feeling that the physicist and he are not in full sympathy and that the physicist has a tendency to treat the phenomena somewhat too broadly, if not superficially—to disregard the fine shades of difference which the chemist learns to evaluate through constant intimate intercourse with materials and his introspective habit of mind.

The electronic hypothesis only began to take firm hold of the imagination after Crookes had called attention to the special properties of the negative electric discharge in high vacua, when Sir J. J. Thomson formulated the view that the Crookes cathode discharge was not particulate in the ordinary sense but composed of moving particles of electricity (electrons) little more than 1/1,800 of the mass of the hydrogen atom. Physicists tell us now that not only is matter atomic—which many scarcely believed 50 years earlier and electricity also atomic; but that atomic matter itself is made up of sub-atoms of electricity, and that, if the properties peculiar to the elements and peculiar to their compounds are to be explained, attention must now be turned to the determination of the electronic structure of the atom (*see* MATTER, CONSTITUTION OF).

Mindful of the long struggle he has waged in determining structure, the chemist foresees that it will not be an easy task for physicists to penetrate the mysteries of sub-atomic structure by experimental means and to arrive at a general agreement as to the validity of their conclusions. The new discoveries are such, however, as he has long awaited and he is profoundly grateful to his physicist colleagues for having taken up the quest at a stage beyond which he could scarcely hope to travel—the methods to be adopted, the kind of logic required, being so different from those proper to chemistry.

We cannot, in fact, overlook the differences which separate the practice of the different branches of science, nor can we disregard the existence of different types of mind suited to one or the other discipline. The line of demarcation, if not the stumbling block, is mathematics: the position of the chemist, in this respect, is midway between that of the physicist and the biologist. The popular saying, "too much learning has made him mad," may be paralleled by the statement that too much mathematics may deprive the chemist of his practical ability, especially of his constructive power; and mathematics seem to be anathema to the biologist and naturalist. Just as it takes all sorts to make a world, so it takes all sorts to solve the infinitely varied problems of science. The attempt to train all by similar methods is bound to end in failure; if it be persevered in, ultimately only the uneducated will be able to do original work.

The new discoveries are those, we say, that the chemist has long awaited. He has often speculated on the constitution of matter and supposed it to be built up of some primordial constituent. He has long thought that the elements are in some way genetically connected, on account of the striking "periodic" relationship they exhibit. He has not been satisfied with the weights he has been forced to assign to many atoms, feeling intuitively that it was not right that even an atom should be inflicted with a weight that had not the dignity of an integer—at least this has been an impression in the minds of those who were fully alive to the wonderful regularities and relationships manifest among the compounds of carbon. Lastly, he has also been prepared to believe that in some cases he might be dealing with mixtures almost impossible to separate: tellurium is a particular case in point, while nickel and cobalt afford another; probably something similar occurs in the case of chlorine.

The facts, however, go beyond all dreams. As the study of the products of radio-active change proceeded, it became necessary to recognize that although each had peculiar radio-active characteristics, the products in a number of cases were not distinguishable chemically; gradually the conception grew up of elements differing in atomic mass but indistinguishable chemically—termed isotopes by Prof. Soddy.

The constant presence of lead in radio-active minerals of various geological ages containing uranium led Boltwood to suggest that lead was probably the ultimate product of spontaneous breakdown in the uranium-radium series. Soddy, speculating on the position of the radio-active elements in the periodic system, came to a similar conclusion as to the origin of the lead in thorium minerals; but on this assumption it appeared probable, taking into account the reduction in atomic mass at the several stages, that the leads from the two sources would be homologous (isotopic). The atomic weight to be expected was in the one case 206, in the other 208. Examining thoric-lead, Soddy and Hyman found the value 207·7, whilst common lead gave 207·2.

T. W. Richards and others carried out similar observations with leads separated from uranium minerals; and from these obtained the low value of 206·05. In another case, Sir J. J. Thomson was led by an entirely special method to conclude that neon was a mixture of two gases; Mr. Aston then succeeded in separating the gas, by diffusion, into two portions differing slightly in density (*see* GASES, ELECTRICAL PROPERTIES OF).

Sir Joseph Thomson's method involved the projection at a photographic plate of molecules carrying a positive charge of electricity, moving with great velocity. Molecules carrying the same charge but differing in mass produced tracks on the plate more or less apart. Mr. Aston developed the method: subjecting the charged particles to the controlling influence of an electric as well as of a magnetic field, he was able so to focus the rays upon the sensitive plate that they produce sharply defined spectra; from the position of the lines it is possible to deduce the masses of the exciting particles. His results are more than remarkable. In the case of chlorine, the chief line is in a position exactly corresponding to that of a molecule of mass 35, a line of less intensity appearing at 37; the hitherto received weight of chlorine being practically 35·5, we have to suppose that the gas is a mixture of two kinds of molecule in the proportion of about 3:1. Bromine (79·92), strange to say, appears to be a mixture in about equal proportions of molecules relatively of mass 79 and 81. Fluorine and iodine, however, behave as simple species.

Atomic Numbers.—Before discussing the bearing of these astounding developments, it is necessary to consider another advance, that made by Moseley—whose death in the World War was one of the most irreparable of British losses—in the discovery of a method of determining the order of succession of what must now be spoken of as atomic species.

The X-rays are regarded as vibrations set up by the impact of the electrons upon material surfaces, the character of the rays being determined by the nature of the material which is bombarded. Moseley's method involved the study of the X-ray spectra of the elements; these he found were characterized by an orderly progression from element to element, so that it was possible from the spectra to arrange them in true order and even to foresee gaps. The spectra are simple and the relationship between successive terms is unmistakable. The numbers indicative of the place of an element in the successional series are spoken of as atomic numbers. The unfilled gaps seem to be few. We have to recognize 92 species of elements; of these only five are missing—numbers 43, 61, 75, 85, 87.

These results are a complete vindication of the policy long followed by chemists of classifying the elements in accordance with the periodic law of Mendeléeff. Tellurium, it had always been insisted, must be placed in the oxygen-sulphur series, in advance of iodine. The "number" assigned to tellurium is 52, which places it in advance of iodine (53), although the accepted atomic weights are 127·5 and 126·92. Now that iodine is regarded as whole, it may safely be predicted that tellurium is a mixture of homologues; an infra-tellurium has yet to be discovered. In like manner, cobalt has always been ranked before nickel, although the atomic weights were against this order; the atomic numbers they have received (17 and 18) are in accordance with this view. Recently Mr. Aston has obtained evidence that nickel has two constituents, one of mass 68, the other of mass 70; the intensity of the spectral lines are approximately as 2:1, in accordance with the atomic mass (68·68) hitherto assigned to nickel.

Assuming Moseley's generalization to be correct and that our knowledge of elementary species is nearly complete, it is possible

to discuss the classification of the electro-primary species with a far greater degree of certainty than heretofore. One fact is clear—that a periodic arrangement was never more justified: formerly this involved placing them in the order of the magnitude of their atomic weights and a sub-grouping under families; there was no means of determining whether or no unassigned numbers were or were not those of missing elements.

We are now on surer ground, as we may substitute atomic number—the integer indicative of place in the evolutionary series—for atomic weight: it were better perhaps to speak of this as the species number. In addition, we have to recognize the existence, within some species at least, of sub-species or varieties differing in atomic mass but in other respects, as a rule, so similar as to be indistinguishable except by special methods. These are the so-called isotopes. In the "isotopic elements," apparently, we are dealing with substances which are closely related in electronic structure, corresponding to the terms in a series of homologous organic compounds.

No precise distinction can be drawn between the terms "chemical" and "physical"—the chemist has availed himself so fully of physical methods that he has made them his own and has difficulty in giving any precise meaning to the expression "chemical property": nevertheless, it has a clear connotation in his mind. The initial and second terms of the great series of paraffin hydrocarbons, methane (CH_4) and ethane (C_2H_6), are, chemically speaking, identical; indeed this is true of the entire group, putting structure aside: the differences are mainly physical—in mass, molecular magnitude, density, boiling point, etc.

In the accompanying table the electro-primaries are classified "periodically," in accordance with their "affinities." It is a striking fact that when arranged in the order of their "species numbers" they fall into eight great families: but progression is not along a continuous spiral. When the 25th place is reached, there is a precipitate fall through 26, 27 and 28; the series is then continued on the descending spiral until a similar precipitate fall takes place at 43 through 44, 45 and 46; again the progression is orderly until at 56 there is an astounding drop to 70; after a short interval, at 75 there is another fall similar to the first and second; during the remaining interval, progress is uniformly on the spiral. The species numbers, in some cases at least, serve but to indicate pockets in which homologues may be stored.

The view which was coming into favour in 1921 involves but an extension of the often discussed century-old hypothesis of Prout, that the elements are all multiples of hydrogen. It has long been held that the ratio of hydrogen to oxygen is 1·008:16, not 1:16; not only is this confirmed by Aston's observations but his measurements seem to justify the conclusion that integral values are to be assigned to all the electro-primaries other than hydrogen (cf. Aston, *Jour. Chem. Soc.*, 1921). It is also a striking fact that no evidence of the existence of variants has been obtained in respect of species the determined atomic weight of which is not an integral value within the probable limits of error. Thus no evidence of the existence of variants is forthcoming in the case of helium, carbon, nitrogen, oxygen, fluorine, sodium, phosphorus and sulphur; but lithium, boron, neon, magnesium, silicon and chlorine are each to be regarded as a mixture of one or more varieties of a single species. The absolute departure, however, from a whole number is no greater for lithium (6·94) than for sulphur (32·06), though in the latter case the difference is a much smaller proportion of the whole: sulphur is evidently a material to be further studied from this point of view.

The extent to which the accepted "atomic weight" differs from a whole number is no indication apparently of the values of which it is an integration. Thus lithium (6·94) appears to consist mainly of a constituent of mass 7 with only a small proportion of one of mass 6; but bromine (79·92) is a mixture in nearly equal proportions of variants of mass 79 and 81; still more remarkable is the composition of mercury (200·6), which appears to consist of 6 variants differing in mass from 197 to 204: krypton and xenon are of like complexity. Apparently the weights of separate species do not overlap. That phosphorus should be without variants and of mass 31 is remarkable, in view of the difference of 16 units between many of the superposed terms in the first and second lines of the table—it would have been less surprising had it proved to be a mixture of units of mass 30 and 32.

The table has other noteworthy features. The members of each of the three metallic triads, on the short precipice faces at the right of the table, might be placed in line and the arrangement would have the advantage of bringing out the homology between their corresponding successive terms Fe, Ru, Os; Co, Rh, Ir; Ni, Pd, Pt. The arrangement has the advantage of being parallel with that which must be adopted in the case of the great group of rare-earth primaries—these cannot be entered across the table—if this is, in any way, to be a picture of the homologies manifest among the primaries. Maybe when this rare-earth group is fully studied, rhythmic variations such as are apparent in the three groups of triads will also be made obvious. It is noteworthy that, of the five presumed missing links in the record, two occur above the platinum triads in positions similar to that manganese has at the head of the iron triad; the third absentee may presumably also belong to the same great family and may well be a radio-active halogen. The fourth gap is in the rare-earth series; the fifth is in the radio-active region.

The classification of Cu, Ag, Au along with the alkali metals, still more that of the iron and platinum triads along with the halogens, may well seem peculiar; but in comparison with the astounding difference in properties between radium (a metal) and the *emanation* from it (a very volatile inert gas) the differences are not surprising. We may well be dealing with collaterals.

The arrangement is comparable with that of hydrocarbons in great families under the empirical symbols C_nH_{2n+2}, C_nH_{2n}, C_nH_{2n-2}, or in a series and in that formed by benzene, naphthalene and anthracene. In the C_nH_{2n} series, for example, the unsaturated ethenoid, hexene, is included together with the saturated hexamethylene (hexahydrobenzene). Benzene itself is usually non-valent but may act as a dyad, tetrad or hexad. Hitherto such variations appeared to be striking when observed among the "elements"; now that these are proved to be structurally complex, we may look forward to the explanation of their functional and physical peculiarities as consequences of structure, precisely as in the case of organic compounds: why some are metals, others non-metals; why some metals are good and others bad conductors of electricity; why some species are coloured, others colourless; why some species, notwithstanding their great mass, are so remarkably volatile—for example, mercury and, most strange of all, the "emanation" from radium—as in organic compounds variation in volatility corresponds very nearly with that of mass. Light may also be thrown upon the special properties of compounds such as carbonic oxide and nitric oxide.

As the interest attaching to the correlation of function with internal structure is now so great, attention may be called to a few special cases in which the structure may be supposed to alter.

A phenomenon which has attracted great attention, in carbon compounds, is that of metameric (isodynamic) change, one of the earliest and most interesting cases observed being that of ethylic acetoacetate, which, according to circumstances, functions in two distinct ways, in correspondence with either the one or the other of the two formulae—$CH_3.CO.COOEt$ or $CH_2.C(OH).COOEt$. It has often been supposed that these are but two reciprocal forms and that the molecule is subject to constant, spontaneous, oscillatory change; the evidence is convincing, however, that like all other cases of chemical change, the alteration is the outcome of a more complex, reversible process conditioned by a conducting impurity. Thus $CH_3.CO.COOEt + HX \leftrightarrows CN_3.CX(OH).COOEt \rightleftarrows CH_2 : C(OH).COOEt + HX$. The two forms have been isolated and their stability shown to be a question of purity.

That alterations take place in internal electronic structure in simple compounds and even in "elementary" materials is already clear. Water affords one of the most striking examples, in the sudden large increase in volume which it undergoes on conversion into ice. Assuming that the molecules are close packed in crystals, the increase cannot well be supposed to be due to their arrangement in any "open" form in ice. Can it be supposed that the electronic systems "expand" in some way? What is most striking is the suddenness with which the change takes place, at a definite temperature or nearly so—for there is evidence that ice is present in water above the freezing point and also that ice contains water.

Evidence of "internal" structural change in elementary materials is to be found perhaps in the peculiar manner in which their heat-

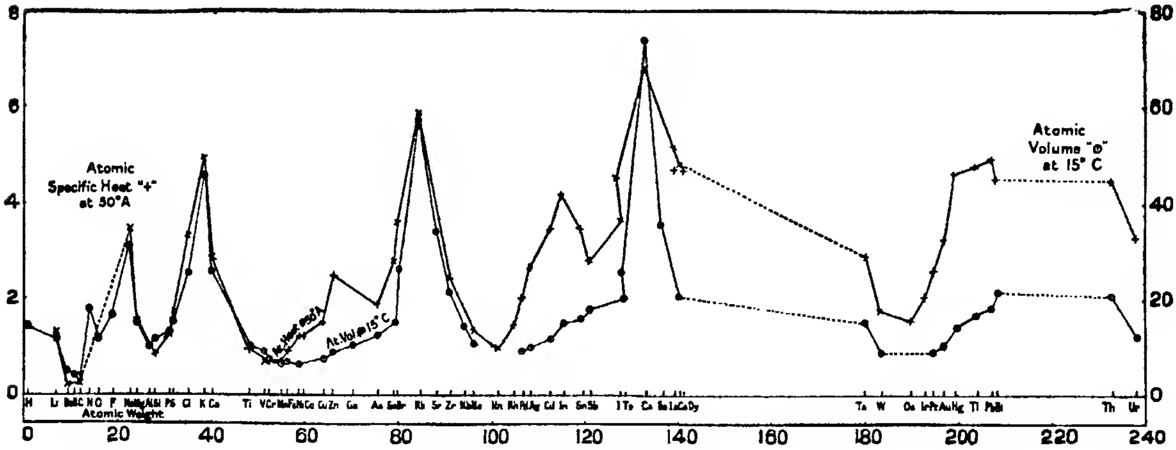

FIG. 1.

Diagram showing periodic variations of heat capacity and atomic volume.

absorbing capacity is dependent upon temperature. The amount of heat absorbed, by atomic proportions of a majority of the primaries, when their temperature is raised through a given interval, it is well known, is nearly a constant quantity over a wide range of temperature; only in the specifically non-metallic elements, silicon, beryllium, boron and carbon, is the departure from this "rule" at all considerable; and in the case of these, as the temperature is raised, the heat capacity increases, until towards 1,000° their behaviour approximates to that of the metals. It was long supposed, in fact, that there was a general tendency for the atomic heats to converge towards a constant value as the temperature was raised and to diverge as the temperature was lowered. Taking into account the fact that metals generally appear to be of simple molecular composition compared with the non-metals, it was not improbable that the differences were, in the main, differences due to molecular complexity; recent determinations of specific heat at the very low temperature of liquid hydrogen (50° absolute), by Sir James Dewar, have brought to light, however, the surprising fact that heat capacity is subject to periodic variation, much as the volume occupied by atomic proportions varies even at ordinary temperatures. The two properties are contrasted in the accompanying diagram.

The striking fact is brought out in this diagram that whilst the chemically most active metallic elements (the alkali metals) are but little affected, the best defined metals diminish in heat-absorbing power to a very marked extent.

The values deduced with the aid of ordinary materials, especially in the solid state, cannot be regarded as "atomic" in any proper sense of the term, as they are of different degrees of molecular complexity and the molecular complexity varies considerably with temperature. Thus a large number of the metals appear to have monatomic molecules, whilst there is reason to believe that those of the non-metallic elements, carbon especially, are of considerable complexity; but even in the case of the elements having monatomic molecules, intermolecular affinity is subject to great variation, being slight for example in mercury but considerable in the case of metals such as gold, silver and copper. In a complete theory of atomic structure, all these variations must be taken into account.

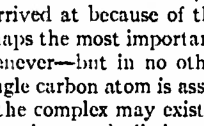
The correlation of molecular structure with function, in the carbon compounds, has been carried so far that the chemist has entire confidence in his conclusions—because of the large number of instances in which a comparison of fact with hypothesis can be made. The assumptions involved are few and it is more than remarkable that it should have been possible to erect so vast and complex a system upon so simple a foundation. The structural formulae of organic chemistry are to be regarded, however, mainly as condensed symbolic expressions, indicative of the general arrangement of the constituent radicles and of the functional behaviour of the compounds represented, not as absolute expressions of structure; indeed, it is becoming clear that the conventions which have hitherto sufficed should be modified in certain particulars to give fuller symbolic expression to the ascertained facts and to render the formulae more nearly a representation of the molecular architecture. In the case of the compounds of elements other than carbon, valid methods of determining structure are yet to be devised. It is surprising, to take an example, that we have no clear conception of the atomic arrangement of so simple and important a substance as sulphuric acid, H_2SO_4.

New methods of promise are coming into use, and it is to be expected that much will be learnt, especially by the study of the internal structure of crystalline solids, by crystallographic (geometric) methods and by means of X-rays—a field of inquiry opened up by Laue and then by the Braggs and others.

Frankland's original conception that the carbon atom has four affinities still holds the field. In modern times, it has been amplified by the introduction of space conceptions and the use of the tetrahedron as a model of the atom; in this way greater precision has been arrived at because of the limitations which are introduced. Perhaps the most important outcome of the hypothesis is, that whenever—but in no other case—a system is formed in which a single carbon atom is associated with four different unit systems, the complex may exist in two like asymmetric forms (of opposite character), distinguished by their power of influencing plane polarized light in opposite directions.

This conception of the carbon atom is entirely justified by the results of the analysis of the internal structure of the diamond by means of X-rays, carried out by Sir William Bragg and his son W. L. Bragg. The arrangement of the carbon atoms is such that every atom is the centre of gravity of four others arranged around it in tetrahedral fashion. Apparently there are definite sub-centres of force on the outskirts of an atom; in the carbon atom of which the diamond is composed, there is evidence of four such sub-centres arranged symmetrically—that is to say tetrahedrally. The atoms in the diamond form two sets; in each set the individual atoms present the same orientation and constitute a cubic space-lattice, but the orientations of the two sets are opposite. The effect of this difference is mirrored in the X-ray spectrum. This conclusion of the physicist is a complete justification of the views long held by chemists that the carbon atom has directed valencies and may give rise to asymmetric structures.

In the Bragg model of the diamond, although they are united similarly and symmetrically, in all four directions of trigonal axes, the carbon atoms can be allotted to similar sets of six, in each of which the individual atoms are united in the manner pictured by the chemist in the symbol of hexamethylene.



Although, in the diamond, the carbon atom is the physical unit or molecule, the molecule may equally well be regarded as indeterminate, indeed as coterminate with the mass, as the constituent units are uniformly related. As influencing our views as to the manner in which solids act in solutions and attract molecules of their own kind, it should be noted that each carbon atom at the exposed surface of the diamond mass has an affinity free.

Chemists have generally assumed that contiguous carbon atoms may be united in three ways, either by single affinities or by two affinities or by three affinities, leaving three, two or a single affinity free to unite with other radicles, thus—

⋮C · C⋮	:C : C:	· C ⋮ C ·
Paraffinoid.	Ethenoid.	Acet(yl)enoid.

Accordingly in van't Hoff's spatial formulae, the two tetrahedra are shown united either (1) by two apices, or (2) edge to edge, or (3) face to face. The three forms of union have all been regarded as possible—in spite of the fact, that the assumption is made, that the four affinities of the carbon atom are exercised in the direction of four lines drawn from the centre of mass through the apices. It has been assumed that the affinities become more or less bent or stressed—as in von Baeyer's well-known hypothesis: hence the instability and attractive power of the so-called unsaturated compounds. In effect the existence of a difficulty has been recognized but met by a compromise.

The only positive evidence brought forward in disproof of Frankland's contention that two atoms may be united by more than single affinities, and that when each has several affinities not engaged by other radicles they mutually satisfy each other, is that advanced by Julius Thomsen in the fourth volume of his celebrated *Thermochemische Untersuchungen*. Thomsen argued, from his thermo-chemical data, that in ethenoid and still more in acetenoid compounds, the bond of union was weaker, not stronger, than that in the equivalent paraffinoid compound. He also maintained that the oxygen atom was not held by two affinities in keto—(CO) compounds; and he even threw doubt on the formulae assigned to ethylene oxide. Of late years, the chemist's peace of mind has been disturbed, and a suspicion created that all is not right with the symbolic system in use, by the discovery of unsaturated compounds in which the existence of single free affinities must seemingly be granted: Gomberg's triphenylmethyl, $C(C_6H_5)_3$, being one of the most striking and compelling cases which no structural sophist has been able to explain away. On paper it is all so easy, and chemists hitherto have been satisfied to work on paper to draw plans with the aid of certain conventions; now the time is at hand to attempt the representation of our ideas in the solid. There is reason to suppose that the study of solid structure, by geometric and X-ray methods in combination, may carry us over our difficulty.

Conflict must arise of the difficulty of interpreting the evidence. This is true already in one very simple case—that of common salt. The interpretation put on the results of X-ray analysis is that the chlorine and sodium units are so placed and so arranged relatively that there is no reason to believe in the existence of a molecular unit NaCl, within the mass. The chemist stands unconvinced before such a statement—he is not prepared to sacrifice the cherished convictions of a lifetime, not being satisfied that the new method is one in which implicit faith may be placed—the more as it has been shown, in the parallel case of potassium chloride, that a but slightly different arrangement of the units is required to give a geometrical structure, in entire harmony with all that is known of the geometrical and physical peculiarities of the crystal, involving no sacrifice of the chemist's view that the molecule KCl has separate existence (*see* Barlow, *Proc. Roy. Soc.*, 1914).

An attempt has been made, in recent years, to correlate outward form or crystalline structure with internal molecular structure, based upon the conception introduced by Barlow and Pope, that, in the case at least of the elements carbon, hydrogen, oxygen and nitrogen, the volume occupied by the atom, in any given compound under given conditions, is proportional to its valency, and that, when changes are effected in a molecule, the ratio is maintained constant although the actual volume may be changed. Taking into account the extraordinary number and variety of the compounds of these four elements, their marked stability and the ease with which interchanges can be effected within the molecules, this conclusion is all but unavoidable; but the solid models built up of spheres of volume 1, 2, 3 and 4, in accordance with such a valency-volume conception, have not answered expectation. A simple modification is possible, however, which is of promise. If a single unit sphere be taken to represent an atom of unit valency, such as hydrogen, atoms which are either di- or tri- or tetra-valent (oxygen, nitrogen, carbon) may be represented by models composed respectively of two, three, and four such spheres in close contact (*cf.* Barlow, *Proc. Roy. Soc.*, 1914, 91-16). Such complexes can be made into close-packed unlimited assemblages throughout which each sphere is in contact with 12 surrounding spheres; no such uniformity can be attained if the spheres differ in volume.

The adoption of the method indicated has important consequences. In the case of carbon, the atom is represented by four unit spheres the centres of which lie at the four corners of a regular tetrahedron. The four hollows on the four faces corresponding to the tetrahedron faces may be regarded each as the seat of an affinity; the union of two carbon atoms by single affinities, therefore, is to be represented by closely approximating two tetrahedral groups face to face, so that the three spheres of a face of the one tetrahedron key into the three hollows between three spheres of the opposed face of the other; the two atoms are thereby oppositely oriented. The eight sphere centres of the complex thus formed mark the angles of a regular rhombohedron, the shorter face-diagonals of which equal the edges. If two spheres representing an oxygen atom be attached to one of the faces, in continuation of the two lines of spheres forming a face, the model may be taken as that of ethylene oxide and it has the peculiarity that, whilst the twin oxygen spheres face the hollow in one of the two carbon pyramids, only one of them touches the other carbon pyramid at one of its apices. The condition is much that suggested by Julius Thomsen—certainly one of unsaturation. Such models can be made into close-packed assemblages of any dimensions, which is not the case when the models used are single spheres of varying volume. The adoption of such models has important consequences. In the case of carbon, the atom is represented by four unit-spheres piled in a pyramid. The four hollows on the four faces of the pyramid may be regarded each as the "seat" of an affinity: the union of two carbon atoms by single affinities, therefore, is to be represented by approximating two pyramids, face to face, rotating slightly, so that the three spheres of a face of the one tetrahedron fall into the hollows between the three spheres of the opposed face of the other; this is equivalent to setting one of the pyramids on its base and interlocking it with the second pyramid placed upside down.

The van't Hoff school has always assumed that the affinities act from the apices of the tetrahedra and have not taken the consequences of close-packing into account. One deduction from their assumption has been that single united carbon atoms are free to rotate—but this is not in accordance with the facts. To take only the case of the aldhexose sugars, of the form COH. $(CH.OH)_4$. $CH_2.OH$. The four OH units in the four (CHOH) groups can be arranged relatively to the two terminal groups in eight different positions and each of the forms has its optical opposite. Fourteen of the sixteen compounds there foreshadowed are known and are stable substances. There must be at least one configuration of principal stability in such a system and if singly bound carbon atoms were free to rotate, a tendency to pass into this stable form should be in evidence. Nothing of the kind is observed: on the contrary, when change takes place it is confined to the part of the system that is directly attacked. The tetra-sphere model of the carbon atom does serve to bring out a certain face-grip between the two united carbon atoms.

By placing tetra-spheres together, in face contact, in the manner described, endless chains may be formed and it is conceivable that the carbon atoms in the paraffinoid hydrocarbons are arranged in rectilinear columns presenting similar parallel sections. It is, however, possible that, under some conditions at least, as in the hexose sugars, there may be a tendency to form condensed systems or rings: peculiarities in the optical behaviour of compounds containing paraffinoid side chains have been noticed which seem to favour such a conclusion, change proceeding regularly and uniformly, from atom to atom, as the chain is increased in length but a different peculiar value is observed at the fifth carbon atom and at each subsequent fifth atom. It is

to be expected that light will be thrown on problems of this order by studies, such as those Langmuir has initiated, of the space occupied by the molecules in liquid films.

The tetra-spheres may be arranged in sheets in any desired numbers, but from such sheets hexagonal blocks may be dissected out, consisting of six tetra-spheres arranged as in benzene, three base downwards and three base upwards, linked in a six-ring system. If to one such segment, six unit-spheres representing six hydrogen atoms be so added that they occupy the six hollows in the six exposed faces of the six tetra-spheres round the periphery of the model, a model of the benzene molecule is produced. The structure is only two layers high but the hydrogen atoms form a separate central chaplet, owing to their position in the hollows at the waist of the system. To pack benzene units together, it is necessary to displace the hydrogen spheres slightly from their central position, so as to bring half of them into the one and half into the other outer layer of carbon unit-spheres. The operation is symbolic of the change involved in the passage of benzene from the liquid into the crystalline state.

The configuration of the benzene model thus contracted is that of two superposed triangles, each side having five spheres, the three corners being occupied each by a hydrogen sphere, the remaining space by unit carbon spheres. The two superposed triangles are in reversed positions, the apex of one falling upon the base of the other, whilst the carbon units of the upper layer fall into the hollows between those of the lower layer. The model is therefore hexagonal in outline with sloping sides.

A feature in the model is the presence both at the upper and lower surface of three unsatisfied "carbon faces." Benzene, in other words, is to be pictured as possessed of a bundle of three unsatisfied affinities at each free surface: these correspond to the six affinities directed inwards in the centric formula.

It is easy to construct models of benzene derivatives, proceeding on similar lines. A matter of interest to be mentioned, in this connexion, is the fact that, in close-packing the units, they cannot generally be arranged side by side but contiguous units must be made to differ in level by one layer in order to secure a fit; the mass therefore has a stepped surface; half its constituent molecular units range higher by the thickness of a layer than those of the other half, the two sets interpenetrating. In a number of cases it has been found that the data deduced directly by geometrical methods from these models, taking into account the recorded characteristics of the compounds dealt with, are in practical agreement with the crystallographic data.

Spheres are used in the construction of the models as a convenient means of showing the relative situations in space of the hypothetical constituent sub-centres of force referred to; these will present homogeneous symmetrical repetition such as is characteristic of crystalline structure. It is not intended, however, to suggest any difference in properties between the space contained within the spheres and that occupying the interstices between them. Indeed, but for the greater mechanical difficulties involved, a partitioning of space into identical cells of regular dodecahedral form would with profit take the place of a closest packed assemblage of equal spheres of the cubic system of symmetry.

Barlow has succeeded in partitioning space into similar plane-faced cells, each having 13 faces, according to hemihedral cubic symmetry; he contends that, if pairs of the cells are symmetrically chosen to represent the molecules of potassium chloride, the arrangement of the pairs completely matches the crystal form; he points out that this highly symmetrical arrangement is derived, by a very simple modification, from the interpenetrated face-centered lattices assigned by the Braggs to the crystal in question. In a number of cases it has been found that the data deduced directly by geometrical methods from these models, taking into account the recorded characteristics of the compounds dealt with, are in agreement with the crystallographic data to an extent well within the ordinary errors of measurement.

Necessarily, spheres are only suitable for the purpose of hand demonstrations. In developing the crystallographic forms, the compression the spheres undergo has to be taken into account. The simplest form of close-packing would involve their compression into dodecahedral cells; but both 13-faced and 14-faced solid units are also possible. The crystallographic peculiarities of potassium chloride may be completely matched on the assumption that the KCl unit is formed of two such cells.

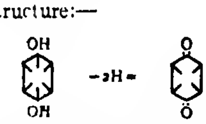
If, as argued, carbon atoms cannot be united by more than single affinities, ethylene and still more acetylene are truly unsaturated and the conventional symbols C:C and C:C are to be read as implying merely certain degrees of unsaturation.

It is a logical consequence of the same conclusion, that only one form of carbon can exist—the diamond. If so, graphite and charcoal are not composed of allotropes of carbon! The elementary nature of the prime constituents of these materials may be questioned on various grounds. Sir Charles Parsons, who has carried out an extended inquiry with the object of producing diamond, has thus far been unable to satisfy himself that it can be obtained by artificial means: he is inclined to think that the crystals obtained by Sir William Crookes may not have been diamond but perhaps silicon compounds of the carborundum type. Diamonds are found in volcanic vents and it is conceivable that they have been formed under transcendental conditions, which cannot now be realized. If allotropes, the two forms should be in equilibrium: as graphite has the higher heat of combustion, the production of graphite alone, without diamond, at high temperatures is remarkable to say the least, particularly in view of the behaviour of phosphorus. Graphite, apparently, however produced, always contains hydrogen. Most striking also is the whiteness and hardness of diamond and its resistance to all chemical agents, when contrasted with the blackness and softness of graphite and the amorphous carbons and the readiness with which these are oxidized. The conversion of the diamond into graphite (?), when it is bombarded by the cathode discharge, is very superficial and may well be due to the intervention of the trace of water which is necessarily present in any vacuum tube through which a discharge passes.

Lastly, the black colour of graphite and the charcoals is an indication of a complex ethenoid or it were better said benzenoid structure, such as the heaviest hydrocarbons are known to possess. The production of mellitic or benzenehexacarboxylic acid, $C_6(COOH)_6$, when charcoal is oxidized, may be regarded as proof that, in charcoal, there is a nucleus in which a benzenoid system of carbon atoms is surrounded by several similar systems, and it is conceivable that, fringing these, there may be others. The stability of such a system, the maintenance of the benzenoid structure, might be secured by the addition of a few hydrogen atoms at the periphery, which would disturb the symmetry sufficiently to modify the electronic orbits and break up the diamond arrangement.

If the carbon atoms in diamond are in paraffinoid arrangement, the properties would be uniform throughout the mass, and the hardness of diamond may be supposed to be due to the manner in which every internally saturated atom is combined with four others: this explanation may be extended to carborundum, silicon being the analogue of carbon. In the benzenoid system of graphite, contiguous benzene units would perhaps be more firmly united than the superposed layers of the complexes: hence its softness and the readiness with which it is split into thin layers.

If valid deductions may be drawn from models such as have been described, it would seem probable that no structural alteration—in the ordinary sense of the term—is involved in the production of unsaturated compounds. In the case of the formation of quinone, for example, it is customary to suppose that not only are two atoms of hydrogen withdrawn from quinol but that the two oxygen atoms from which they are taken away become doubly united with the benzene system and that this is coincidently changed in structure:—



The model suffers no such change: only the molecular units need to be rearranged to make good the withdrawals. The changes

must be in some of the electronic systems within the molecules; obviously, when the oxygen in no way has its attention engaged by hydrogen, its influence must in some way be felt more in the neighbouring carbon system; these, however, are dynamic changes, not evident in a model. The limitation is one to which our structural formulae have always been subject.

Whatever be the distribution of affinity in the carbon atom, in compounds it appears to be greatly modified, so that structural models, like structural formulae, must be interpreted with caution. To take a simple case, the change from benzene to hexamethylene seems to involve merely the addition of six more hydrogen atoms at the periphery, not the direct neutralization of the two sets of three affinities at the free carbon surfaces.

This pulling down of the affinities into two planes seems to be a general rule. Mr. Barlow finds, for example, that the model of tartaric acid constructed on this principle is in absolute accord with the crystallographic peculiarities of the acid.

Fig. 2 shows front and back views of the arrangement of the units in glucose, $C_6H_{12}O_6$. The carbon units may be distinguished without difficulty as the grey spheres, the cross denoting the position of the pyramidal apices; the white spheres are the hydrogen units; the twin dark spheres the oxygen atoms. Each layer consists of a succession of rows of four spheres. The free carbon area is of considerable extent at both surfaces: it will be obvious that, if some degree of residual affinity were exercised over these areas, successive layers of molecules might well be attracted into position, if once a single layer were deposited, as in crystallization.

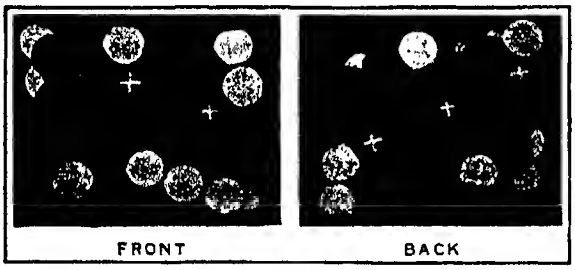


Fig. 2.

Front and Back Views of the Arrangement of Units in Glucose. (From *Journal of the Society of Arts*, Sept. 12 1919.)

Chemical Change: Determinant and Catalyst.—Although the subject of chemical change has been much discussed of late years, the chief advance has been in the attention paid to catalysts, which have acquired popularity owing to their use in a number of industrial processes. Although it is recognized that often some determining agent is required to condition an interaction, and the feeling is widespread that this is more generally true than has been supposed, the primary conditions of chemical change are seldom set forth; seldom is the practice departed from of using simple equations in which the two agents and the resultants alone appear, the need of a third substance being left out of account and unindicated.

The determining process is spoken of with increasing frequency as catalysis, the supposed agent being termed the catalyst. The conception was introduced by the great Berzelius in 1835, and was applied by him to such diverse changes as the hydrolysis of starch by acids and also by diastase; the oxidation of various substances in presence of platinum, especially when used in the finely divided state (platinum black); and the formation of ether from alcohol by means of sulphuric acid. Berzelius drew no distinction between interactions in solution and those in which solids such as platinum were involved. It is clear that he took an electro-chemical view of the process—his opinion being that the office of the catalyst is to awaken slumbering affinities through its presence and to determine a greater electro-chemical neutralization; probably no one has been nearer to our modern conception. Whether he had been in any way influenced by Faraday's electro-chemical researches of 1833-4 is not clear.

Now that it is so generally admitted that Faraday's dictum is to be accepted, that ordinary chemical affinity is a consequence of the electrical attractions of the particles of different kinds of matter and that the forces termed chemical affinity and electricity are one and the same, it may be asserted, as a necessary corollary, that the conditions which determine chemical action are those which determine electrolytic action.

Speaking generally, it may be affirmed that two substances cannot interact; a third must be present to determine the necessary slope of potential and flux of current. Thus zinc, whether highly purified or amalgamated, is all but unattacked by an acid, and it is logical to assert that, if pure, it would be unattacked; when coupled with an electro-negative inert conductor, it is dissolved, indeed, very rapidly, if the resistance in circuit be small. Or to condition attack, a depolarizer may be used, as in the case of copper, for example, which readily dissolves in dilute sulphuric acid in the presence of oxygen.

The rule appears to be that the three necessary factors must be conjoined in a conducting circuit; one of them must be an electrolyte; one of the remaining two and the electrolyte must be substances that can interact; the third may or may not take part in the chemical interchange—if it takes part, by acting as a depolarizer, it adds to the efficiency of the change, raising the electromotive force. Brereton Baker, in the course of his refined studies on the influence of water as a determinant of chemical change, has given abundant proof of the accuracy of the above-given definition, particularly by showing that a mixture of hydrogen and oxygen cannot be fired, even in presence of water; and that interaction takes place only when an impurity is present, which impurity, together with the water, forms an electrolyte. A trace of acid suffices.

Years before this result was obtained, it was possible to predict that water alone would not condition the interaction of hydrogen and oxygen—because it was not an electrolyte. It is true that this contention is not generally admitted—it is held that water *per se* has a slight conductivity; but this conclusion involves the unjustified assumption that Kohlrausch dealt with pure water and that the minimal conductivity which he observed was an intrinsic property of water. The course followed by Kohlrausch in purifying water, however, involving as it did nothing more than distillation within closed glass tubes, was by no means a refined one from our modern point of view; to assume that he had reached finality is absurd: it is impossible to obtain a vessel without surface impurity which is not open to attack; access of atmospheric impurity cannot be entirely prevented; further, some form of electrode must be used; pure water, therefore, will ever remain an ideal, and whilst it is logical to extend the curve representing the loss of conducting power, as the impurity is reduced, to zero origin, on no theoretical grounds are we called on to believe that it should come to rest short of this point.

Especially is this the case, in view of the conclusion of the dissociationist school, that in aqueous solutions the dissolved substance is alone resolved into its ions: muriatic acid, for example, is assumed to be a mixture of undissociated molecules of water with the separated ions, H and Cl. Unfortunately, the modern chemist too often lacks feeling for his material, and, without sympathy, understanding is impossible. It is impossible to put two so closely related and similar compounds as water (H_2O) and hydrogen chloride (HCl) on the different planes they necessarily occupy, if the one be regarded as all but entirely stable and the other as entirely unstable.

That a profound chemical change takes place on bringing together the two compounds, hydrogen chloride and water, is beyond question. To regard the water as inert is impossible—if it were, the gas would not be so attracted as it is. Equations such as the following are not merely rational but necessary expressions in illustration of the changes that may occur:—

$$H_2O+ClH \rightleftharpoons H_2O\cdot ClH \rightleftharpoons H_2O<^{Cl}_{H}$$

The part played by water in activating hydrogen chloride may be compared with that of magnesium in Grignard's well-known

agent. No one assumes that in this agent alkyl and halogen are present in the state of free ions—they are dissociated but only in the sense that they are separately held by the metal. The forces of residual affinity have been entirely disregarded by the dissociationist school; and not being practised chemists, knowing nothing of the organic side, they have left facts out of account. The implications in Longfellow's lines, with reference to the sea—

Only those who brave its dangers
Understand its mystery—

will ever be true and generally applicable. It is necessary to give this warning to the coming generation of workers.

Granted that the interaction, in the case of the formation of water from hydrogen and oxygen, be determined by the presence of an electrolyte (an acid impurity), is this to be thought of as the catalyst? *What is a catalyst?*

The definition of a catalyst which is generally current is that it is an agent which merely accelerates a change in being: but this is based upon the gratuitous assumption that two pure substances can interact. If this definition could be accepted, the acid impurity determining the rapid interaction of hydrogen and oxygen when a mixture is fired might be called the catalyst.

The issue is not quite so simple, however, since another class of activating agent has to be considered—namely the solid, such as platinum and the enzymes of natural occurrence. Hydrogen and oxygen at once interact when brought into contact with platinum black or with a " clean " platinum plate. Again, it is customary to think of the platinum only as the determining agent; there can, however, be no doubt that, in this case also, the electrolyte must be present. It does not seem probable that platinum in itself would form a conducting circuit with hydrogen and oxygen: if the two gases were condensed at its surface even to the extent of being liquids, these would be non-conducting liquids.

The probability of this view is enhanced when the nature of the process is taken into account and it is realized that the primary interaction is not even that of hydrogen and oxygen atoms but that, initially, the oxygen is converted into hydrogen peroxide, acting as " depolarizer " in an electrolytic circuit, whilst the hydrogen is " hydroxylated," as shown in the following equation:

$$\begin{array}{l|l|l c l|l|l} H & HO \ldots\ldots\ldots\ldots\ldots\ldots H & O & = & HOH & \ldots\ldots\ldots\ldots\ldots\ldots & HO \\ H & HO \ldots\ldots\ldots\ldots\ldots\ldots H & O & & HOH & \ldots\ldots\ldots\ldots\ldots\ldots & HO \end{array}$$

Hydrogen Electrolyte Oxygen Water Electrolyte Hydrogen Peroxide.

In the next change, the hydrogen peroxide acts as depolarizer, so that the reduction of the oxygen molecule is affected in two stages. According to this view, the electrolyte is the determining agent, the platinum exercising only an accelerating influence—if the definition of a catalyst as an accelerator be retained, the platinum rather than the acid is to be regarded as the catalyst.

Two other cases may be considered with advantage—(1) that of a ferrous salt in promoting oxidation by means of hydrogen peroxide; (2) the hydrolytic action of enzymes. Hydrogen peroxide has little effect as an oxidizing agent and probably, if it could be used in pure solutions, it would be without action; oxidation at once sets in on the addition of a trace of ferrous salt. Familiar cases are the liberation of iodine from iodides (rendered evident by the presence of starch) and the oxidation of tartaric acid to dihydroxymaleic acid (rendered evident by the appearance of a violet colour on addition of excess of caustic soda). What is the function of the ferrous salt—is it of such a kind that it is to be ranked as a catalyst? Its function would seem to be rather that of carrying the peroxide into action through the formation of a perhydrol which can act as an electrolyte, thus:—

$$Fe\begin{cases} OH \\ SO_4H \end{cases} + \begin{array}{c} HO \\ HO \end{array} = Fe\begin{cases} O.OH \\ SO_4H \end{cases} + OH_2$$

Ferrous sulphate. Hydrogen peroxide. Ferrous sulphate perhydrol.

The case of the enzymes is more complex. These are all of natural origin and can only be judged by their actions. It is desirable to confine the term to hydrolytic agents.

Take the case of invertase, the enzyme present in ordinary yeast, which acts only on cane sugar and certain derivatives of this sugar. Cane sugar is hydrolysed, more or less readily, by all acids, being converted into the two hexoses, glucose and fructose:—

$$C_{12}H_{22}O_{11}+OH_2.HX=C_6H_{12}O_6+C_6H_{12}O_6+HX.$$

It is similarly affected by invertase acting in a solution which is only faintly acid. Taking into account the amount of change effected by a small amount of enzyme compared with that effected by a relatively large amount of even a strong acid, it is clear that the enzyme is far more active than is any acid *per se;* it certainly, therefore, can be regarded as an accelerator rather than as a determinant of change. The minute amount of acid which appears to be necessary may be regarded as active in the same way that a trace of acid is active in determining the interaction of hydrogen and oxygen at a platinum surface.

The essential differences between the two classes of agent, the acid and the enzyme, become obvious when the rates at which action proceeds are contrasted. In any interaction occurring in an aqueous solution, such as that in which cane sugar is hydrolysed by an acid, so long as the solution be not too concentrated, the disappearance of water may be disregarded, owing to the relatively small extent to which it is withdrawn—so that only a single changing substance need be considered. In such a case, the amount of change, during each successive interval of time, is proportional to the amount of unchanged substance present. If say 10% disappear during the first period, 10% of the remainder will disappear during each successive period, *i.e.* 10, 9, 8·1, 7·29, during periods 1, 2, 3, 4, etc. The graph representing the rate of change is a logarithmic or exponential curve.

When cane sugar is hydrolysed by the enzyme invertase, the rate of change is of an entirely different order; within wide limits of concentration, well beyond the 50% limit, equal amounts are hydrolysed in each successive interval; the graph representative of the rate of change is, therefore, nearly a straight line. This behaviour is characteristic of enzymes generally, though in many the rate is modified fairly soon by the reversal of the change or otherwise. The same behaviour is met with in solid catalysts, *e.g.* the reduction of the fatty oils and of unsaturated compounds such as ethylic cinnamate ($C_6H_5.CH:CH.CO_2Et$) and anethol ($C_6H_4.C_3H_5.OCH_3$), by hydrogen in presence of finely divided nickel. Such results cannot well be explained except by the concentration of the interacting materials at the solid surface; as enzymes behave like nickel, they too must be thought of as acting in a similar way and as merely suspended in the liquid in which they are brought into action. This explanation is rendered the more acceptable by the fact that enzymes will act even when suspended in alcohol, in which they certainly are insoluble. It thus appears desirable to confine " catalyst " to particulate agents acting at surfaces of concentration, and to apply the term " determinant " to agents, such as ferrous sulphate or acids, acting under conditions of uniform distribution, in solution. The determinant may be said to be required in all cases, being the agent which constitutes the solvent an electrolyte. It is here assumed that no liquid *per se* is an electrolyte, excluding fused salts as liquids.

The assertion of the Arrhenius school that water—pure water—is very slightly dissociated and that it can by itself determine some slight amount of change, is neither logical nor rational. Water is one of the most protean of compounds and has properties which are altogether special. In considering the problems of particulate action, it is necessary that changes in water itself should be taken fully into account. Whilst it is admitted that water is a polymorphous substance and that we are not justified in assigning the simple formula H_2O to the molecule except it be in the state of dry steam, there is no agreement as to the constitution of the liquid or of ice. To avoid confusion, it is well to assign a special name to the simple molecule: *hydrone*, proposed by H. E. Armstrong, appears to be appropriate, most in accordance with its neutral character and justified by analogy, its organic analogue being the ketone acetone, $OC(CH_3)_2$. The passage of water through its three states is too commonly represented as a series of physical changes; actually there can be little doubt that a complex series of structural changes is involved. Accord-

ing to Tamman, ice can exist in no less than six forms, depending on the conditions of pressure and temperature. No substance can be studied better from the electronic standpoint.

On the ground of analogy, the chemist can foresee the existence of an active *Hydronol* and of a variety of neutral *Hydrones* corresponding to the paraffinoid polymethylenes, thus

$$H_2O \quad H_2O.OH_2 \quad H_2O{<}{\genfrac{}{}{0pt}{}{H}{OH}} \quad \genfrac{}{}{0pt}{}{H_2O.OH_2}{\dot{O}H_2} \quad \genfrac{}{}{0pt}{}{H_2O.OH_2}{H_2O.\dot{O}H_2}$$

No valid method of determining the complexity of the molecules either of water or of ice is known; all that can be asserted is, that water especially must be a mixture and that its composition not only may but must be subject to considerable variation as the temperature is changed or substances are dissolved in it. Whatever the composition of the mass, at the surface, the simple molecules of hydrone (OH_2) must be present in maximum proportion; and this will also be the condition at the surface of solid particles suspended in an aqueous solution.

As the most active solvent in water must be the hydrone molecules, in a solution in which fine particles are suspended the liquid layer at the fluid-solid interface should be more concentrated than the general body of the solution. Hence the special activity of enzymes and other particulate agents: apart from any special attractive influence exercised by the solid surface, the layer at the interface is likely to be specially active as a solvent.

The enzymes, however, exercise a selective activity which is altogether peculiar—each enzyme can induce the hydrolysis, if not of a single compound, at most of a set of structurally similar compounds. Thus the enzyme urease will act only on urea. Invertase acts only on cane-sugar or derivatives of this sugar in which its special structure is retained and only an addition made to the molecule.

In the case of glucose, a large number of compounds are formed by the introduction, in place of either the one or the other of two terminal hydrogen atoms, of some equivalent group. Two series of glucosides are thus produced, known respectively as α- and β-glucosides. An enzyme is present in yeast (maltase) which will induce hydrolysis of all the α-glucosides; the bitter-almond contains an enzyme which acts only on the β-compounds.

The only possible explanation of this behaviour seems to be that the enzyme is structurally related to the compound which it affects, so that it actually fits upon it and grasps it, as it were. This view involves the further assumption that the specific agent of change is also carried by the enzyme, as the amount of acid which suffices to determine the exercise by the enzyme of its maximum activity is so small that it scarcely seems probable that the rapid action is the consequence of the mere concentration of this acid together with the hydrolyte at the surface of the enzyme; nor is such an assumption compatible with the selective activity of enzymes. More probable is it that an acid radicle is operative which the enzyme itself carries, this being in such a position that it is brought into proximity with the attached molecule (the hydrolyte) at the point at which hydrolysis takes place—the acid which is added serving to maintain this radicle free and also acting as the necessary electrolyte, as in the case of platinum.

It should be added that, although platinum and similar catalysts are not structurally selective agents, their action is in some respects limited—as, however, is that of most chemical agents. Thus, whilst hydrogen and oxygen interact at a platinum surface, a mixture of carbonic oxide with oxygen remains unaffected; indeed, carbonic oxide interferes with the oxidation of hydrogen in presence of platinum; this behaviour, however, is perhaps less a consequence of the lack of affinity of carbonic oxide for platinum than of intrinsic peculiarities of the gas. Platinum and similar catalysts, especially nickel, have a very wide range of activity as hydrogenising agents.

The question remains—how is the action of platinum effected; is it merely a physical condensing agent or is it to be regarded as acting chemically? The view has long been held that it may combine with oxygen—if not with hydrogen—and that it promotes oxidation through the intermediate formation of an oxide. Recently, Willstätter has shown that platinum and palladium are without action even as hydrogenising agents if they have been freed from oxygen. He advocates the view that a compound is formed, which is both hydride and peroxide, in which hydrogen is present in a more readily dissociable form than in the hydrides of the metals. Spongy platinum, prepared by reducing chloroplatinic acid with formaldehyde in presence of caustic potash, may be deprived of oxygen by suspending it in glacial acetic acid and passing hydrogen through the liquid, either in the course of 30 hours at atmospheric temperature or in 8 hours at 50° to 60°. Such a product is insoluble in muriatic acid and does not liberate iodine from an acid solution of potassium iodide; it will not condition the hydrogenation of benzene to hexamethylene, etc., but acquires the power when shaken, during a short period, with air. During hydrogenation, the catalyst invariably becomes deoxidized by the action of the hydrogen and needs revivification by oxygen. Willstätter suggests that the metal is converted into either the peroxide $Pt{<}{\genfrac{}{}{0pt}{}{O}{O}}$ or the corresponding perhydrol $Pt{<}{\genfrac{}{}{0pt}{}{O{\cdot}OH}{OH}}$ and that this is convertible into the hydride $\genfrac{}{}{0pt}{}{H}{H}{>}Pt{<}{\genfrac{}{}{0pt}{}{O{\cdot}OH}{OH}}$.

By this assumption, the activity of platinum in promoting oxidation is brought entirely into line with that of ferrous sulphate, which, it has been pointed out, is probably active as a perhydrol. Interesting light is also thrown on the hitherto enigmatic behaviour of haemoglobin, which combines directly with oxygen, forming oxyhaemoglobin, by the fact that the oxidized platinum catalyst may be deprived of its oxygen and rendered nearly inactive by continuous exhaustion with a high vacuum pump, the means by which oxyhaemoglobin may be entirely deprived of oxygen: the parallel is made all the more remarkable by the fact that the oxygen may be displaced from oxyhaemoglobin by carbonic oxide, which renders platinum inert towards hydrogen. Oxyhaemoglobin has a big molecule, as it is composed of a protein in association with haematin; if the oxygen be present in it, perhaps in combination with the iron atom, in the form of perhydrol and it acts in the blood corpuscle as a particulate agent, the remarkable oxidizing power of the blood may be reckoned among the actions promoted by catalysts.

It is customary to regard haemoglobin as a "colloid," but in using this term we are again in difficulty owing to the lack of a clear definition of its precise connotation. Latterly the word has been used almost as the synonym of the state of very fine sub-division—any substance present in suspension in a liquid in a very finely divided state has been spoken of as a colloid.

Originally this was not the meaning associated with the term by Graham, who introduced it and applied it generally to glue-like substances. He appears to have thought of the colloid as soluble but as merely opposite in the scale of solubility to the ordinary crystalline, more or less easily soluble substances of relatively low molecular weight—in fact, as a big, lumbering molecule, with slight affinity for the solvent and therefore ready to separate from it in the pectous or particulate form. Unfortunately, not only has the connotation of the term been altered but a confused language has grown up about the term which renders the consideration of the activity of substances in the particular state specially difficult. Far worse, the attempt has been made to constitute so-called Colloid Chemistry a separate discipline, the designation being arbitrarily confined to suspensions of fine particles varying from one thousandth (μ) to one millionth ($\mu\mu$) of a millimetre in diameter.

If this definition be accepted, the "colloids," when separated, in the particulate state, from solutions should function as catalysts under favourable conditions; and this appears likely to be true. One of the few cases apart from the action of enzymes—which are selective catalysts—of a colloid having been shown to act specifically as a catalyst is in the production of hydrazine from ammonia, by the action of a hypochlorite, by Raschig's method, an interaction which is promoted by the addition of glue,

the amount produced being thereby much increased. In this instance, the catalytic effect may well depend upon the intermediate formation of a protein chloramine.

It is desirable here to call attention to certain peculiarities in the behaviour of enzymes which merit consideration in view of their action being that of particular agents. When submitted to the action of the enzyme urease—best used in the form of an extract of the soya bean—according to the amount of enzyme used, urea, for example, is rapidly hydrolysed, at a diminishing rate as the action proceeds. Contrasting the effect on a solution of moderate strength with that on a concentrated solution, it is noteworthy that the amount changed is considerably less in the latter: thus in an experiment in which gramme-molecular (6%) and five-gramme molecular (30%) solutions were contrasted, at the end of 10 hours, the ratio of the amounts of acid required to neutralize the ammonia formed was as 55 in the case of the stronger to 132 in that of the weaker solution.

Proof that the diminished activity of the enzyme is the consequence of the increase in the concentration is given by the observation that, if methylurea be, in part, substituted for urea, the amount of the latter hydrolysed is less than in the absence of the methylurea. Methylurea is not in the least affected by the enzyme, this being strictly selective in its action, attacking only urea, none of its derivatives.

Special reference is made to these observations as showing that in the case of catalysts generally the conditions at the surface cannot be considered independently of those in the medium. It is, however, to be noted that, even in simple solutions, in the case of interactions taking place under the influence only of determinants—in the absence of a catalyst, as defined in this article the rate of change is not proportional to the concentration. This is seen at a glance on reference to the accompanying graph (fig. 3) representing results obtained on hydrolysing cane-sugar with nitric acid, the sugar being the only variable. Such variations are certainly due to reciprocal variations in solvent and solute as the concentration is changed.

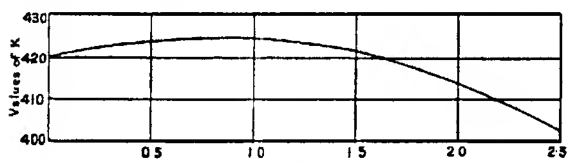

Fig. 3.
Molecular Proportions of Sugar.

It is known that absorbents take up relatively more of a substance from dilute than from concentrated solutions. That the condition of " water " at a surface differs from that in the main body of the liquid seems also to follow from the observation that wet paper does not stiffen until the temperature is reduced to $-0{\cdot}1^\circ$ and that the water in a clay sphere does not freeze until $-0{\cdot}7^\circ$. The observation made by Adrian Brown and Tinkler, that when barley corns are steeped in a 50% solution of acetic acid, the absorbed liquid ultimately in equilibrium with that outside the corn contains 80% of the acid, would seem to show that the " water " of the thin film distributed over the surfaces of the starch granules is more active than ordinary water. Substances so diverse and different from acetic acid as aniline and phenol behave in a similar way, accumulating in the capillary spaces. In the enzymes which act on carbohydrates, not only is the rate of change diminished by foreign substances generally but those which resemble the hydrolyte in structure exercise a retarding influence far in excess of neutral materials. Thus the hydrolysis of the glucosides, whether α or β, is specially retarded by glucose, but not nearly to the same extent by the isomeric galactose. If the argument advanced above that the enzyme must fit the hydrolyte be accepted, it is obvious that a substance which could also be fitted upon the enzyme will necessarily interfere more with its activity than would a substance whose interference would be merely mechanical—by getting in the way—or that of a solute modifying the osmotic condition. A special interference with enzymes and with other catalysts which function chemically, not merely as surface condensing agents, may arise through the neutralization of the functioning radicle; hence perhaps the great influence of acids and alkalies. The accompanying graph illustrates the behaviour of urease

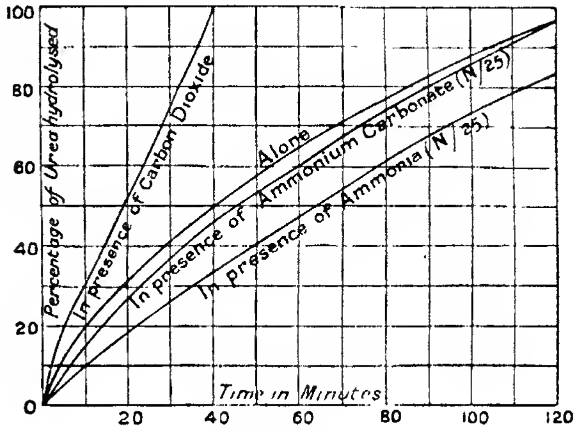

Fig. 4.
Behaviour of Urease under Action of Enzyme.

when subjected to the action of the enzyme alone or in presence of either both or one or other of the products of change. Hydrolysis is retarded by the weakly alkaline mixed product of change. Taking the products separately, the more strongly alkaline product ammonia has a still greater retarding influence; on passing carbon dioxide into the solution, however, so that it is present in excess, the action of the ammonia is held more strongly in check and the action is greatly accelerated.

In the case of urea, under the influence of the enzyme, the interaction is complete—there is no reaction or reversal. This is theoretically wrong. Cane-sugar behaves similarly. In other cases, an equilibrium point is reached and the enzyme will act reversibly in a solution—if it be sufficiently concentrated—of the products of change, reforming the hydrolyte.

Thus α and β methyl glucosides are resolved into methylic alcohol and glucose by the enzymes maltase and emulsin respectively; the resolution appears to be complete in dilute solutions but is less and less so the more concentrated the solution; and if a mixture of methylic alcohol and glucose in water be submitted to the action of either enzyme, the appropriate glucoside is reproduced in proportion to the concentration.

The behaviour of a fatty oil (olive oil) in presence of the enzyme lipase affords a particularly striking illustration of the manner in which change in the two possible but opposite directions is balanced as the conditions are varied. On reference to the accompanying graph it will be seen that as the amount of water present is increased the amount of fat hydrolysed is increased; as the fat and the fatty acid are insoluble, it is to be supposed that the water acts by diluting the glycerol and it will be noted that, if glycerol be added, the extent to which hydrolysis takes place is diminished.

The reason why urea and cane-sugar are not reproducible from the final products of change by the respective enzymes is not clear; it is not improbable that the final are not the initial products and that the initial products have but an ephemeral existence in solution: some link in the chain of change is lost by the occurrence of an action outside the range of the enzyme.

Urea is known to undergo change reversibly in solution into ammonic cyanate: $CON_2H_4 \rightleftarrows NH_4NCO$. The proportion of cyanate present at ordinary temperatures is known to be very small; it is slightly increased by boiling the solution; if silver nitrate be added, which serves to fix the cyanate as insoluble silver cyanate, an almost complete conversion can be effected.

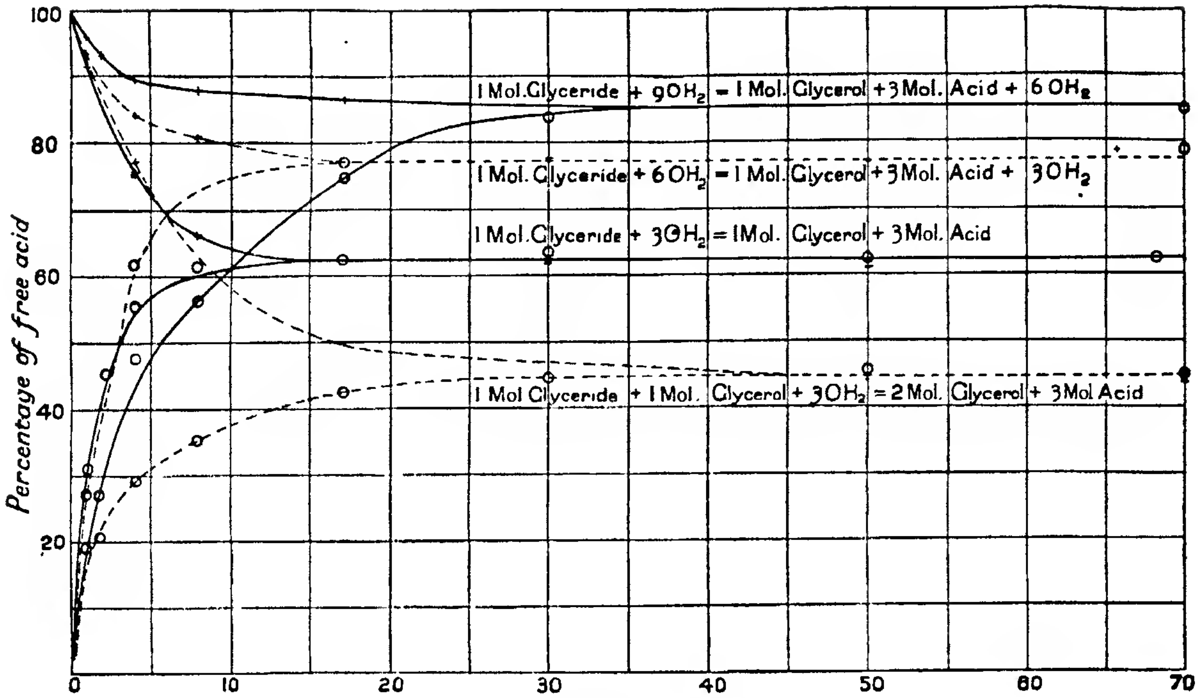

FIG. 5.
Behaviour of Fatty Oil under Influence of Enzyme.

No evidence of the production of cyanate during the hydrolysis of urea by urease has been obtained.

It is of interest that, whereas ammonic thiocyanate can be destroyed by bacterial action, thiourea cannot; this compound is not known to undergo change in solution.

Before leaving the subject of catalysts, the rusting of iron may be referred to as a case in which the action is influenced by a particulate agent. The subject is one of perennial interest and it is strange how slowly the nature of the process is appreciated. It must be electrolytic; the metal is attacked primarily in a circuit comprising the electro-negative conducting impurity present in all irons and the electrolyte on its moist surface, usually carbonic acid, the product being a soluble ferrous salt. If this salt remain at the surface, it necessarily undergoes hydrolysis yielding ferrous hydroxide, which is deposited as solid and sooner or later oxidized to a ferric hydroxide. J. A. N. Friend has recently advanced a "colloid theory" in explanation of the process. He shows that in moving water there is little rusting, though the iron is slowly dissolved—as must be the case on the above view. He considers that the ferric hydroxide precipitated on the surface under still conditions acts catalytically, by oxidizing metallic iron with relative rapidity and simultaneously undergoing reduction to a lower hydroxide, etc. It is well that this effect of once formed rust should be insisted on; but it stands to reason that it should act as an accelerator, by promoting, through the surface action of its fine particles, the condensation both of electrolyte and of oxygen, whether or no it act itself and be alternately reduced and reoxidized.

The part played by the determinant in gaseous interactions has yet to be appreciated. The results obtained by Bone and his co-workers at high pressures are specially significant. When a mixture of hydrogen and oxygen, diluted with nitrogen, is exploded, the pressure rises to a maximum almost immediately; if methane or carbonic oxide be burnt in place of hydrogen, the pressure developed rises to a maximum only gradually. The process of change must be far more complex in the latter cases. The slowness of the change, in carbonic oxide, may reasonably be ascribed to the prior conversion of the oxide into formic acid ($CO+OH_2=H_2CO_2$) before it is burnt (cf. *Trans. Roy. Soc.*, 1915, A. 215, 275).

Whatever the phenomena considered, if the view be taken that chemical change is essentially an electrolytic process, conclusions such as have been formulated cannot be avoided. The process, in the main, is the same in all cases. The "determinant" is the cause of change; when a catalyst is present, the rate of change is greatly accelerated, owing to the concentrating effect this exercises; maybe, in some cases, the catalyst is required together with the determinant to constitute a conducting circuit of the interacting materials.

It is strange that the action of the determinant is so much overlooked. Recent observations by H. B. Baker show that its influence is to be considered even in cases of chemical change not ordinarily regarded as such—the evaporation of liquids. Long ago it was proved by him, that not only do hydrogen chloride and ammonia not interact when dry but that the product of their interaction, ammonium chloride, does not decompose so readily, when heated, if dried. He now finds that as liquids, such as benzene and bromine, are rendered more and more nearly dry, the boiling point rises and at the same time the weight of the molecules in the liquid gradually increases. Strange to say, when shaken with water, the polymerized benzene only slowly passes back into the simpler state.

As the phenomena of chemical change are more and more closely examined into, the conviction grows that molecular structure and affinity are the determining causes; to correlate these with the electronic structure of the constituent materials is the difficult task of the coming generation. Why is carbon so entirely peculiar an element? Why has oxygen so remarkable an influence on the development of acidic qualities? An endless series of such questions may be asked. They must be answered in terms to satisfy the chemist—to satisfy his dynamic as well as his structural cravings, and to explain the many variations in function which follow from variations in composition.

A revolt is now setting in against the tendency to accept purely physical interpretations of chemical phenomena, which has so long been prevalent and has too often led chemists to overlook the complexity of the conditions prevailing in solutions. As a result, undue importance has been attached to mathematical agreements which it is clear have but served to give colourable expression to the facts; and the minute and penetrating analysis

to which phenomena should be subjected has been unduly discouraged. For example, the apparently physical phenomena of lubrication have been reduced by the observations especially of W. B. Hardy and of Langmuir to terms of chemical structure and of function as determined by molecular structure. A single layer of molecules is sufficient to cover and cloak a surface—a matter of importance to be borne in mind in considering the action of catalysts—and the disposition of the molecules is determined by their structure. Thus the spread of a liquid upon water is determined by the affinity of the substance for water but this is a localized function of its structure. Langmuir's measurements show that, in the case of the complex fatty acids, the molecules are to be thought of as having only the terminal carboxyl groups "dissolved" or dipping down into the water, the complex hydrocarbon group sticking up much as does a fisherman's float. Molecules so placed, ranged side by side in piles, would present an upper surface composed of the terminal methyl groups (CH_3).

W. B. Hardy's measurements show that the lubricating effect of substances is definitely a function of molecular structure; it therefore varies with the nature of the surface to which it applies, as both the affinity of substance to surface and intermolecular affinity are functions of the structure of the substances. Much has been done of late, especially by Jacques Loeb, to show that chemical conceptions can be applied in explanation of the peculiar "physical" properties of colloid materials and that the behaviour of these is comparable with that of crystalloids when determined under proper conditions. The passage of colloid materials from the dissolved to the undissolved particulate state and the accompanying changes are certainly matters to be considered from the point of view above explained.

Most irregular results have been obtained by several workers who have studied the effect of different acids on various properties, such as viscosity and osmotic efficiency, of liquids containing gelatin or egg albumin; as a rule, acids have been used in equivalent concentrations, without taking their relative efficiencies into account. Loeb has shown that there is no difference in the effects of a variety of acids when the solutions of the protein acid are of the same acid efficiency (the same *p*H value) and the same concentration of the originally isoelectric protein. The same is true of alkalies. The proteins exist in three states, by derivation from the aminocarboxy-acids: either the molecule may be neutral or it may be either acidic or basic. Thus, if brought into contact with a salt at *ap*H $=4\cdot7$, gelatin is neutral; but at *ap*H $< 4\cdot7$, it forms an acid salt, whilst if the *p*H be $>4\cdot7$, a metallic salt is formed.

Not only are more precise conceptions of the behaviour of colloids being formed by such studies but light is also being thrown on the characters of the acids. W. B. Hardy, in 1907, pointed out that the solvent power for globulin of strong and medium acids is measured by the number of gramme-molecules present, not by the number of gramme equivalents. He wrote $HCl=H_2SO_4=H_3PO_4$; adding, "very weak acids have a lower solvent power—$HCl = 5HA = 3000\ H_3BoO_3$. These relations are explained by the very weak basic functions of globulin." Loeb has obtained results of the same order. Using gelatin and egg albumin, he has found that most acids act as monobasic molecules—not only phosphoric acid but also the organic dibasic acids, succinic and tartaric, even tribasic citric acid; oxalic acid, however, was intermediate in behaviour between the mono- and di-basic acids; sulphuric acid was definitely dibasic, serving to couple two molecules. That oxalic and the other organic acids should act as monoacids sulphuric.

The whole question of effective acidity is one requiring further study—it may be questioned whether any inorganic acid be more than monobasic in the proper sense of the term.

Benzenesulphonic acid ($C_6H_5SO_3H$) and similar acids have about 90% of the hydrolytic efficiency of sulphuric acid; it would therefore seem probable that this acid is to be regarded as an unsymmetrical hydroxysulphonic acid rather than as $SO_2{<}^{OH}_{OH}$ (cf. *Proc. Roy. Soc.*, 1914, 90, 73).

Progress in Industrial Chemistry.—Chemistry is a constructive as well as an analytic science, touching our life at every point: In it is embodied our knowledge of the materials of which the world consists and the office of its priests is to make clear the manifold activities of these materials. The science is fundamental to all our industries; the key to our own nature and acts may eventually be found within its precincts. How much our insight is deepening, our outlook widening, how much the science is gaining in precision, the previous sections of this article may have shown; in the following, the attempt is made to trace out the main lines along which specific advance is taking place.

The progress in industrial chemistry, in recent years, has been very marked. Even in the oldest of chemical industries, the heavy chemical trade, so called, which includes the manufacture of alkali and of sulphuric, nitric and muriatic acids, as well as bleaching-powder and soap, great changes have been effected.

Sulphuric acid has been made to an ever-increasing extent, especially since the outbreak of the World War, by the "Contact Process"—by associating sulphur dioxide directly with atmospheric oxygen, by means of a finely divided platinum used as a catalyst. When the usual raw materials were not available, a process was worked out, in Germany, in which calcium sulphate was roasted in a rotatory kiln, together with silica, clay and powdered coal—thus producing sulphur dioxide; the residue was used for cement manufacture.

During the war nitric acid was produced for the first time on a large scale by the direct oxidation of ammonia—again with the aid of platinum as a catalyst. The special factory erected for its manufacture was constructed in six months, at a cost, it is said, of £4,000,000. Another synthetic process of making nitric acid is that of Birkeland and Eyde, developed at Notodden, in Norway, since 1903, which involves the application, on a large scale, of Cavendish's fundamental discovery that nitric oxide may be produced by passing an electric discharge through air (*see* NITROGEN FIXATION). The world is, therefore, now independent of the natural supply of nitrate in the form of Chili saltpetre.

The manufacture of caustic soda and potash by the electrolysis of a solution either of salt or of potassium chloride, has been carried out on an ever-increasing scale; as a consequence, chlorine has been produced, in considerable quantities, together with hydrogen. More chlorine having been made than could well be used in the manufacture of bleaching-powder, the first steps have been taken towards preparing muriatic acid directly from chlorine and hydrogen. The production of chlorine, in excess of the normal requirements, was probably the primary cause of its use in the World War. Another consequence has been the introduction of a variety of chlorinated compounds, *e.g.* chlorinated ethanes and tetrachlorethylene, as solvents.

Even in the ammonia-soda process changes are foreshadowed. This process involves the treatment of a solution of salt containing ammonia with carbon dioxide and the production of sodium bicarbonate, together with ammonium chloride. The custom has been, after separating the carbonate, to recover the ammonia by distilling with magnesia, allowing the magnesium chloride to run to waste. Now that ammonia is likely to be procurable in large quantity, the more rational course would seem to be to separate the ammonium chloride as such and use this as an agricultural fertilizing agent in place of ammonium sulphate—thus saving sulphuric acid.

The manufacture of ammonia directly from atmospheric nitrogen and hydrogen, through the agency of a catalyst, under a pressure of between 200 and 300 atmospheres, has been carried out, on a large scale, in Germany, during several years past; in fact, there seems to have been over-production. Latterly, a modified process, at a much higher pressure (1000 atmospheres), has been developed by the French engineer Claude.

Another process of making ammonia, now fully developed, involves the production first of calcium carbide, CaC_2, by heating a mixture of lime and anthracite coal in an electric furnace; then the conversion of this carbide, by direct absorption of nitrogen, into calcium cyanamide, $CaCN_2$. This latter interaction takes place at a moderate temperature and with

remarkable ease. Ammonia is obtained by subjecting the cyanamide to the action of steam.

Calcium carbide, it should be added, is made on a large scale as a source of the gas acetylene ($CaC_2+OH_2=C_2H_2+CaO$), now so much used as a lighting agent for road-traction purposes and even for domestic lighting away from towns; but chiefly, together with oxygen, in the form of the acetylene blowpipe, in cutting iron plates in the shipbuilding and other trades, in joining iron rails for the electric tram service, etc.

The production of nitrogen for the above-described processes and of oxygen has been greatly promoted by the researches on the liquefaction of gases carried out by Sir James Dewar, at the Royal Institution, Albemarle Street, London, the home of Davy and Faraday. The metallic vacuum vessels invented by this indefatigable student of low-temperature phenomena have made possible also the use of liquefied air, richer in oxygen than air, in various ways—in hospitals, for example; also, together with charcoal, as an explosive agent, in mining operations.

The astounding power properly prepared charcoal has, at liquid-air temperatures, of absorbing gases, another discovery made by Sir James Dewar, is proving of the greatest value in operations involving the separation and purification of gases. It is even contemplated that it may be possible to fill airships with the incombustible, rare gas, helium, prepared by taking advantage of this property of charcoal—the source of the helium being the natural gas associated with petroleum, in the American oil wells and in certain springs in Canada.

To return to the nitrogen compounds, the outstanding importance of ammonia and nitric acid will be understood when it is realized that cereal crops, including the sugar cane, cannot be grown without nitrogenous fertilizers. At Rothamsted, where wheat has been grown on the same land year after year under the same treatment since 1852, the average yield of grain has been only 12·0 bushels per acre on the permanently unmanured plot; whereas on the plot properly supplied with nitrogenous manures, it has been 31·6 bushels.

Now that both ammonia and nitric acid can be produced, by synthetic means, in any desired quantity, the world need have no anxiety as to the supply of artificial nitrogenous manures. Even if fuel should not be available to supply power, their manufacture will always be possible where water-power is to hand.

Large quantities of ammonium nitrate were made, during the war, for use in admixture with trinitrotoluene as a high explosive. Sulphate of ammonia and nitrate of soda are both only of partial value as fertilizing agents, as the one necessarily contains excess of acid and the other excess of alkali; these remain after the nitrogenous effect is exhausted; also the constant use of the sulphate involves a steady withdrawal of lime from the soil, ultimately rendering it acid, whilst the tendency of the alkali from the nitrate is to make the soil impervious to water. Of late years, there has been a gradual growth of opinion, therefore, in favour of ammonium nitrate, as this combines in itself the activity of an ammonium salt with that of a nitrate and, being used up entirely in the service of the plant, has not their harmful effect upon the soil. The objection to the use of the nitrate is its tendency to liquefy on exposure to a moist atmosphere and that it sets to a hard mass; moreover, it cannot be transported in bags.

The Germans have foreseen the value of urea, CON_2H_4, which is free from the disabilities associated with the nitrogenous fertilizers now in use. It is an entirely neutral substance and is undoubtedly an effective fertilizing agent under some conditions but it has yet to be shown that it could be used generally in place of the ammonium salts and nitrates. It can be made merely from ammonia and carbonic acid, so that if its manufacture can be put upon an economic footing and it prove to be suitable at least for most purposes, though it may not supersede ammonium salts, it may largely displace them from use.

Other methods of exploiting nitrogen are being studied which involve the direct absorption of the gas and its conversion to a cyanide; it is well within the bounds of probability that these may ultimately prove equal, if not superior, to the highly mechanical methods now coming into vogue: these latter, however, will have the advantage that they can be carried out with the aid of water-power, unless the fixation methods should also be such as to necessitate the use of electric power.

More natural processes are also in sight. It is now customary, in most civilized countries, not only to waste the excreta of the urban populations but to do so at considerable cost. In the East, in China especially, human excreta are most carefully collected and used on the crops; they are actually a source of revenue to one or more towns. An activated sewage sludge process is coming to the fore which may be of service under European conditions: whether this will do more than conserve nitrogen is a question; if also the waste of phosphate can even be partially prevented, infinite service will be rendered. The chief limiting factor of agricultural production in the near future will clearly be the supply of phosphate and in the next degree of potash; we now know how to bring down nitrogen from the air but the supplies of phosphate and of potash are being drawn upon at exorbitant rates and must ere long be exhausted; no ways of withdrawing them from the vasty deep, which can be put in practice, are before us. It is found that at least the solid matter in sewage can be recovered in a valuable form by forcing air into the fresh liquid; when this operation has been repeated several times, first forcing in air, then allowing the suspended solid to subside, running off the liquid and adding fresh sewage, the sludge acquires a greatly enhanced bacterial activity and apparently even nitrogen-fixing organisms come into activity: eventually it may contain 6 to 7% of nitrogen and become equal to farmyard manure in value.

The amount of farmyard manure now available is insufficient, as the number of horses kept is so much less than formerly. Recent inquiry has shown that a complex series of changes is involved in the production of this manure from the straw and animal exuviae of which it is composed and that eventually it may contain a considerable amount of nitrogen beyond that originally present in the raw materials. Organisms are at work which destroy much of the carbonaceous matter but, in the course of the operation, they induce the fixation of a certain amount of atmospheric nitrogen, if supplied with the nitrogenous food they require for their own development. It is therefore conceivable that an economic process may be developed of manufacturing farmyard manure from waste carbonaceous materials with the aid of ammonia. The development of greatest importance in agriculture, however, to which we may look forward, is the direct enrichment of the soil with nitrogen, directly withdrawn from the atmosphere: either by means of organisms functioning in immediate association with leguminous crops; or by organisms within the soil, whose activity is promoted by the judicious use of green manures. No branch of scientific inquiry is of greater importance to mankind than studies to promote such ends.

The soap industry has undergone marked development of late years, owing to the increasing consumption of margarine as a substitute for butter. As the hard fats are required for the manufacture of this material, it has been necessary to make use of the natural fatty oils in soap-making; these differ from the hard fats in that they are glycerides not of saturated but of unsaturated fatty acids. To harden them, *i.e.* to convert them into glycerides like those contained in the ordinary solid fats, the heated oils are subjected to the action of hydrogen gas in presence of finely divided metallic nickel, which acts as a catalyst. The process is now carried out on a very large scale.

In the metal industry, the developments have been in matters of detail. Aluminium, nickel, tungsten and sodium have been brought greatly to the fore. One of the most notable achievements is the production of a rustless steel, an alloy of iron and chromium, which will bear sharpening when made into knives; apparently the special qualities of the steel are the outcome of a particular structure developed by heat treatment, though why the alloy should be rustless is not clear.

As illustrations of the manner in which the rarer inorganic materials are gradually being imported into industry, reference may be made to the use of vanadium oxide as an oxidizing catalyst; of titanium oxide as a white paint—on account of its high

refractive power; and of cerium alloyed with iron—in substitution for the old flint and steel in kindling fire.

Marked progress has been made in devising synthetic methods of manufacturing some of the simpler carbon compounds heretofore obtained only from natural products. Thus formic acid has been prepared, on a considerable scale, by combining carbonic oxide with caustic soda, under pressure—one of the earliest syntheses effected by the French chemist Berthelot.

Acetylene, another discovery of this chemist, has been converted into alcohol, on the large scale, by processes also due to his acumen, by passing acetylene, prepared from calcium carbide together with hydrogen over a suitable catalyst thus producing ethylene, $C_2H_4 = C_2H_2 + H_2$; then absorbing the ethylene in sulphuric acid of suitable strength and distilling with water, to hydrolize the sulphate that is formed $C_2H_4 + H_2SO_4 = C_2H_5.\ HSO_4 \| C_2H_5.\ HSO_4 + H_2O = C_2H_6O + H_2SO_4$. The process is said to have been an economic success, in Italy, where water-power is available. The process has also been carried out experimentally with coke-oven gases as a source of ethylene.

During the war, much acetic acid was made from alcohol by first converting this into aldehyde and hydrogen, by passing the vapour over heated copper; then oxidizing the aldehyde by means of air, in presence of a manganese salt. Acid so made is of better quality than that from crude calcium acetate. Acetic acid has also been produced by oxidizing aldehyde prepared directly from acetylene, through the agency of sulphuric acid acting in conjunction with mercuric and ferric sulphates; oxygen distilled out from liquefied air has been used in the process. The cost of acid prepared in this way, in one of the chief German works, in 1919, is stated to have been £50 per ton. The importance of acetic acid is now far greater than it was, owing to the use that has been made of it in preparing varnishes or dopes for airplane cloth. The attempt is also being made to develop the manufacture of artificial silk from acetylcellulose.

The manufacture of explosives has involved various other developments. Prior to the war, the acetone used as a solvent, in making the propulsive cordite—a mixture of the trinitrates produced on supernitrifying glycerol and cellulose—was obtained by the dry distillation of calcium acetate, this being made from the crude acid which is obtained, in carbonizing wood, together with wood spirit or methylic alcohol. When a shortage of the supply of acetate was imminent, two new methods of making acetone were developed—one involving the passage of acetic acid vapours over heated alumina ($2CH_3.\ COOH = CH_3.\ CO.\ CH_3 + CO_2 + OH_2$); the other the fermentation of glucose by a special organism giving rise to a mixture of acetone and normal butylic alcohol. Success was found to depend on the use of a pure organism and at first much difficulty was experienced in sterilizing the large bulks of liquid used: two of the organisms were not killed until the temperature was raised to 130°.

Acetone was originally used in making cordite, because it is a solvent of cellulose trinitrate. Another way of overcoming the difficulty, created by the shortage of the solvent, was found in the use of a less nitrated cellulose, soluble in a mixture of ether and alcohol. This departure involved the manufacture of ether not by a new method but on an unprecedented scale, without any difficulty. Another substance made on a scale which might previously have seemed inconceivable was hydrogen cyanide or prussic acid. Experience showed that any desired substance may be made on any desired scale, putting economic cost aside.

Hitherto, glycerol has always been obtained from natural fats, usually as a by-product of the manufacture of soap. It is a constant product of the fermentation of glucose by yeast in the brewing process, although only about 3% of the sugar used takes this form. Experiments carried out in America and Germany, during the war, showed that the proportion might be raised even to 20% by carrying on the fermentation in presence of an alkaline sulphite or carbonate. If needs were, therefore, glycerol might be manufactured from starchy materials.

A point of interest in connexion with explosives was the use during the war, for the first time, of Borneo petroleum as a source of much of the toluene required for the manufacture of trinitrotoluene (TNT). Previously, toluene had been obtained only from coal tar. The presence of this and similar hydrocarbons in petroleum was first noticed by Hugo Müller and Warren De la Rue. The complete nitration of toluene to TNT is a matter of some difficulty. As proof of the value of scientific insight and the practice of a rigid scientific method in manufacturing industry, the fact may well be mentioned here that the most efficient British works for the production of this explosive, although only a small one, in point of quality of product and cost of production, was one established, at a very early date, by a Scotch professor and a young colleague versed in physical chemistry.

The explosive picric acid or trinitrophenol was also made on a large scale, not only from phenol extracted from coal tar but also from synthetic phenol, prepared by sulphonating benzene and fusing the sulphonate with caustic soda ($C_6H_6 + H_2SO_4 = C_6H_5.\ SO_3H + OH_2$; Ph. SO_3 Na + Na OH = Ph. OH + SO_3 Na_2). In England and France the old, barbaric, wasteful process of nitrating the phenol was unfortunately followed and the manufacture was never put on a scientific footing. A substantial amount was made, however, by a very superior process, involving the conversion of benzene, C_6H_6, first into chlorobenzene, C_6H_5Cl, then into dinitrochlorobenzene, $C_6H_3(NO_2)_2Cl$, next into dinitrophenol, $C_6H_3(NO_2)_2{\cdot}OH$, finally into trinitrophenol, $C_6H_2(NO_2)_3{\cdot}OH$. The operations are all carried out with extreme ease and except the first afford all but quantitative yields.

Many substances were made for the first time on a large scale during the war, and used as "poison gases" and to excite weeping; among the latter was chloropicrin, produced by "chlorinating" picric acid, in presence of soda. The one which became of most consequence, the so-called mustard gas, really a by-no-means easily volatilized liquid, was always manufactured by the Germans by a rather involved process devised by Victor Meyer, which was never brought into operation, in an effective manner, elsewhere than in Germany. Shortly before the Armistice was declared, however, a far simpler method was developed, in England, which involved merely chlorinating sulphur and then passing ethylene into the chloride:

$$S_2Cl_2 + 2C_2H_4 = \left.\begin{matrix} C_2H_4Cl \\ C_2H_4Cl \end{matrix}\right\} S + S$$

Very large quantities had been prepared for use in the field, just before the war came to an end. No difficulty was experienced in preparing any desired quantity of ethylene, by heating alcohol with phosphoric acid.

Two substances have acquired importance, the one as a detonator, the other as a primer in starting the ignition of the less sensitive TNT, lead azide, $Pb(N_3)_2$, and trinitrophenylmethylnitramine, $C_6H_2(NO_2)_3.N.(CH_3).NO_2$. The former has the advantage that it is stable under the high temperature conditions of the East, where mercuric fulminate, the detonator commonly used, cannot be kept long. Prior to the war, the acid HN_3, from which the azide is made, was little more than a chemical curiosity and almost feared on account of its instability. The nitramine referred to was made preferably from methylaniline but chiefly from dimethylaniline, two substances much used in the dyestuff industry.

Attention has been directed very frequently, of late years, to the production of a substitute for indiarubber. Thus far the German manufacturers have not been able to control the final stage of the process, that by which the simple hydrocarbon used initially is converted into the rubber complex. The "polymerization" is effected only gradually and at a slow rate; in fact, the material is merely placed in hermetically sealed barrels and allowed to remain undisturbed, during six months, at about 32° C., the rubber being finally obtained as a white spongy mass which has to be bored out of the barrels. The minimum cost of production appears to have been about 18s. per pound. The Germans went so far, however, that they organized the manufacture on the scale of a possible output of 1,000 tons per month. The opinion that prevails is that the process cannot under any conditions be an economic success, until it can be controlled and much accelerated; it is dangerous to assume that this will

not be done. Moreover, the attack on the rubber trees by fungoid pests is becoming so serious and the conditions of growth are so special, if not unnatural, that the future of the "natural" industry cannot be regarded as established and secure: it may well suffer the fate of the coffee plantations in Ceylon. The direct vulcanization of rubber, it may be mentioned, is now effected, in a most ingenious manner, by subjecting the material to the action of sulphuretted hydrogen and sulphur dioxide gases, the necessary sulphur being produced *in situ* by their interaction.

In the great dyestuff industry, the developments have been mainly in the direction of improvements in the manufacture of the intermediate materials and in the use of by products as substantive agents; the tendency has been to aim at the production of dyestuffs of ever-increasing fastness, that is to say, able to withstand light, soaping and the bleaching agents so largely used in cleansing fabrics. To cite an instance of progress in the making of materials, phthalic acid is now produced by merely passing the vapour of naphthalene mixed with air over a heated catalyst—vanadium oxide—instead of by the uncertain and troublesome method of heating with sulphuric acid and mercury. The most notable advance in the manufacture of dyestuffs is the use particularly of the hydrocarbon anthracene, the parent of the madder dyestuffs, in the production of a series of pigments known as vat dyestuffs; one of the latest of these is a green, in many ways superior to the green dyestuffs hitherto known. Like indigo, these are reduced, in the dyer's vat, to a soluble state, by means of sodium hydrosulphite; when the cloth has been impregnated with the solution and it is exposed to the air, the reduced material becomes oxidized and the dyestuff is deposited within the fibre. The really serious rival of indigo, in the future, may well be one of these dyestuffs, indanthrene, which is a magnificent blue considerably superior to indigo in fastness. The contention that natural dyestuffs are superior to the artificial is now disproved in a multitude of cases.

In addition to indigo, a variety of *indigoid* dyestuffs, similar in constitution to indigotin, including derivatives of this latter compound, are now in use, differing from it in shade of colour. *Indigo*, the product of various species of *indigofera*, has never been made artificially: only its chief pigmentary constituent, *indigotin*, is manufactured. Synthetic indigotin is now largely used, especially in calico printing; it is of particular value in dyeing light, clear shades of blue. These cannot at present be secured with the aid of indigo; but the natural product is now known to be superior for heavy shades on wool (blue serge, etc.), owing to the presence of other dyestuff constituents, together with indigotin. Much has been done during the war to re-establish the indigo industry in India. If scientific findings be accepted, provided the commercial side of the problem be properly handled, indigo may well resume the place it had lost as a dyestuff, though it can never attain to exclusiveness.

One important development in this field is to be chronicled. In photographic chemistry, which has long been at a standstill, there has been a notable advance, particularly in the all but complete control secured over the colour sensitiveness of the photographic plate. When the necessity arose, the required staining materials were produced in English laboratories without any difficulty and a command of the problems of staining has been secured far beyond that of the Germans.

Astonishment has been created by the discovery that certain stains (notably pheno safranine) so diminish the sensitiveness of the gelatine-bromide emulsion to light, that if the most sensitive of plates be exposed, then placed during a brief period in a weak solution of the stain, development afterwards may be carried out in the weak light of an ordinary candle.

A great new field on the verge of development is that of the carbonization of coal at low temperatures, with the object of conserving the gaseous and oily products that are burnt wastefully when it is used directly as a fuel, as well as of obtaining a solid fuel, of higher efficiency than coal, which can be burnt without producing smoke. The long-discredited process of making illuminating gas for domestic use by merely distilling coal must soon be superseded by rational methods, especially as the demand for gaseous fuel is increasing very rapidly. The change will involve the disappearance of gasworks tar, so that the dyestuff industry will be forced to rely upon the high temperature coking ovens for its raw materials—or discover other sources of supply; the use of tar on roads will also be diminished. The development of a synthetic process to convert a mixture of carbonic oxide and hydrogen into methane may well prove to be of importance in this connexion. It is known that the conversion may be effected without special difficulty, using nickel as a catalyst; but the process has yet to be developed on an economic scale. The successful use of nickel as a catalyst, in purifying coal gas from sulphur (other than as sulphuretted hydrogen), may be referred to as another striking instance of industrial advance.

A wave of scientific method is pulsating throughout the world, which is everywhere influencing industrial development. There is an obvious desire to assimilate the procedure of the works with that of the scientific laboratory and particularly to develop the use of machinery in the former; but if empiricism be departing, progress is at very different rates, not only in different lands but in different industries, some being very slow to move. The chemist of the future, to carry the burdens of his day and succeed, will needs be both very widely trained and gifted with reflective power and insight: victory must fall to the scientific rather than to the strong or the swift.

Progress in Organic Chemistry.—It is necessary to be clear what the expression "Organic Chemistry" should cover. As a philosophy, at the present time, chemistry is in a difficult position owing to the extent of the field, the over-subdivision of the subjects and the ever-growing tendency of workers to specialize, knowledge of facts having been unduly cultivated at the expense of breadth and precision of scientific outlook. Liebig remarks, in one of the earliest of his celebrated *Letters on Chemistry*, "The attaching too high a value to the *mere* facts is often a sign of a want of ideas. It is not fertility, but poverty of ideas which clothes itself with a mass of coverings of all sorts or wears old, battered, threadbare and ill-fitting garments." It is to be feared the criticism holds to-day.

The science of chemistry is conventionally divided into two main sections—the inorganic and the organic; but these are most unfortunately defined. Substances derived from animals or plants—formed it was thought under the influence of a vital force—were originally the subject matter of organic chemistry. When the discovery was made that such substances could be prepared by artificial means—first in 1828, when Wöhler synthesized urea—organic chemistry became the study of the compounds of carbon: though the systematic definition was a gain of precision, the chemist's outlook was narrowed and confined, as attention was withdrawn from the concurrent study of vital phenomena. A more unfortunate consequence of the rigid subdivision of the field is, that the two branches have been treated as separate disciplines; usually the carbon compounds have been regarded as the subject mainly of higher academic and professional study, so that those who have sought to acquire only an elementary understanding of chemistry have been denied the very knowledge likely to be of most importance to them.

The study of carbon compounds has been prosecuted with extraordinary diligence, during the past 50 years, by a large number of workers who have been attracted by the beauty of the problems the subject affords and the consistency of its methods. An astounding fabric of structure has been reared which is all but unknown, except to the few; and yet it is laid upon the simplest of foundations and its main features and lessons are easily grasped. No one can claim to be a chemist who is not seized with the spirit of this knowledge.

The study of structure has played little if any part in inorganic chemistry and until recently this branch attracted relatively few workers; it has further suffered, not only from neglect to apply the lessons to be derived from carbon compounds but owing to its own subdivisions—through the treatment of metals under metallurgy, as a separate subject. Of late years subdivision has been carried still further, by the creation of a physical section of very limited range, as something apart; the attempt has

even been made to treat "colloids" as a separate branch. To make chemistry of avail some change of attitude is desirable. The prime need of our time appears to be that we should recognize the essential unity of chemical science, in order that we may teach the fundamental principles and the syntactical issues as a single discipline. The characteristic of organic chemistry has been the attention paid to the determination of molecular structure and to that of function, both chemical and physical, as an outcome of structure; too little attention has been paid by the inorganic chemist to these issues. It is essential that the conception of structure and the methods followed in determining structure in the case of the simpler compounds of carbon should be brought before the student at an early stage.

Ceasing to draw the invidious distinction now made by classing carbon apart, mainly because this element has so numerous a progeny, we shall with advantage treat each of the great family groups of elements as a separate stock or tribe, but take into account the graded interrelationship of families and the effects of unions between their members.

No science can work alone. The chemist in future will be associated either with the physicist or with the biologist, if not with both. In conjunction with the former, he will extend his studies of structure and function into atomic regions: the quest is one that seems to need the mathematical habit of mind. He will coöperate with the latter by applying his knowledge of molecular structure and function to the explanation of the living mechanism and of its activities as functions of structure—even including those of mind: in this field the mathematical habit of mind seems to be almost out of place.

We may anticipate, wrote Liebig, more than 70 years ago, that from organic chemistry the laws of life—the science of physiology—will be developed. It is in this sense that we need to raise up a science of organic chemistry in future—the organic chemist must once more be the proclaimed student of vital phenomena, not merely of materials. The two outstanding exponents of the art thus defined have been Liebig himself and Pasteur, the one having rendered supreme service by his general prescience, the other by demonstrating the essential interdependence of chemical and vital phenomena.

The great lesson we have thus far learnt is that the activity of nature is of a circumscribed character, far more so, in fact, than is that of the chemist in the laboratory. At some time choice has been made of particular types of material and definite lines on which alone action may proceed have been laid down. Nature has learnt to wear only a single glove: all living things are essentially composed of one-handed (asymmetric) materials. The controversy long waged over spontaneous generation must be regarded as futile, in face of this conclusion. Whether the lines of action in nature are innate in the primary materials used, time alone can show: the chemist is tempted to think that this may well be, as within his own field of operation he finds that the structural possibilities are most definite in character and relatively few in number. The underlying policy of nature would seem to be the repetition of units of a simple kind. Tennyson has summed up the situation in the line—

So careful of the type she seems,

and Pasteur, in the more definite comprehensive phrase, *La vie est dominée par des actions dissymétriques.*

Apparently the destinies of life are determined by the element carbon, which is distinguished from all others not merely by the multiplicity of its compounds but by their relative stability—a stability, however, which is accompanied by remarkable plasticity. If there be life elsewhere, it can scarcely be very different from ours—carbon seems to be the only possible nucleus element, the only one which can give rise to combinations imbued with the necessary stability and also sufficiently reactive.

Next to carbon, water is the factor of primary importance. The operations of dehydration and of hydration play the determining part in the constructive process; next to these come those of oxidation and reduction, which are but the separated activities of those of hydration or its reverse.

The level of energy is raised by oxidation; it is gradually lowered by successive "hydrations," as in the process of fermentation. Whilst the chemist is frequently forced to resort to high temperatures and high electromotive forces to produce his result, nature does most of her work at a low energy level. In only one operation is she helped by a transcendent, irresistible power—that of solar radiations of short wave length: but this is the primal step in life and the energy taken in at this stage must suffice in all subsequent acts, as even that derived from oxygen is to be thought of as stored up in the same operation; the separation of the oxygen from the natural system carbon dioxide plus water, now with the aid of chlorophyll but primarily through some simpler agency. Nothing is more wonderful than the silent, steady way in which the glucose, formed at the expense of the carbon dioxide present to the extent of only three ten-thousandths in the air surrounding the plant, is built up underground, in the dark and at atmospheric or a lower temperature, into starch—as in the potato tuber, for example. In no way can the chemist imitate the act. Selective and directive influences are clearly at work: we have reason to believe that these are to be found in an enzymic mechanism.

The observations made, of late years, on the formation of minute amounts of formaldehyde and even of glucose on exposure of solutions of carbonic acid to rays of short wave length, are of little if any assistance in enabling us to follow the natural process. A complete mechanism is provided in the chlorophyll system but what this includes we do not know. The suggestion has been made that there is a factor at present unknown, as assimilation (measured by the amount of oxygen liberated) is less active in leaves brought into light when only a few days old than in leaves equally greened several days older.

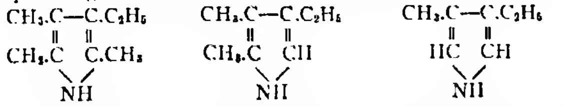
Of chlorophyll itself much is now known. So long ago as 1864, the late Sir George Stokes came to the far-reaching conclusion that the chlorophyll of land plants is a mixture of four substances, two green and two yellow, which by proper treatment may each be obtained in a state of very approximate isolation. Most of the chemists who followed him succeeded only in isolating decomposition products, but Willstätter, who took up the inquiry in 1906, has shown that the inference of the great physicist was correct. He finds that all green plants contain

Chlorophyll a, blue-black, in solution green-blue $C_{55}H_{72}O_5N_4Mg$
Chlorophyll b, green-black, in solution pine green $C_{55}H_{70}O_6N_4Mg$
Carotene, orange-red crystals .... $C_{40}H_{56}$
Xantophyll, yellow crystals.............................. $C_{40}H_{56}O_2$

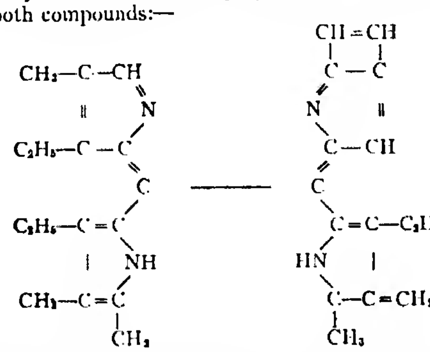
The brown algae contain a third yellow constituent, fucoxanthin $C_{40}H_{54}O_6$ though a very small proportion of b chlorophyll. The pigment of the ripe tomato is an isomeride of carotene, lycopin. Egg-yellow is coloured by an isomeride of xanthophyll, lutein. Willstätter finds that there is less variation in the amount of chlorophyll in plants of different species than in leaves of any one plant of different age or subject to different conditions of exposure. The amount varies from 0·6% to 1·2% of the dry weight and is usually about 0·8%, 0·6% being the a and 0·2% the b component. There is no noticeable variation during the day. The yellow pigment varies in amount between 0·1 and 0·2%, 0·07 to 0·14 being xanthophyll and 0·03 to 0·08 carotene. Expressed in molecular proportions, the a component is present in the ratio of 3 to that of 1 of the b variety; the yellow pigments are present in the reversed ratio of 1 of carotene to 1·5–2 of the oxidized compound xanthophyll but the variation being greater between exposed and shaded leaves than in the chlorophylls. The ratio (a+b) of the chlorophylls to the yellow pigments (c+x) as a mean of all the determinations made is 3·56, the value for exposed leaves being 3·07 and for shaded 4·68. Only further inquiry can show whether the coloured components of the chloroplasts are all genetically connected and which have functional significance.

It is a striking fact that chlorophyll has the closest affinity with haemoglobin, the red colouring matter of blood, the central system of each being apparently a complex of four substituted pyrrole rings; the two compounds are so closely related, in fact, that they may be reduced to the same compound, athiopor-

phyrin $C_{31}H_{36}N_4$ when decarbonylated; in the one, an atom of the metal iron is included, in the other an atom of the metal magnesium; these metals, however, are not in the state in which they occur in their ordinary salts. When completely degraded, both compounds give rise to a mixture of the three simple pyrroles:—



The character and complexity of their structure will be apparent on consideration of the following formula assigned provisionally by Willstätter to athioporphyrin, the derivative common to both compounds:—



Athioporphyrin is convertible into a magnesium derivative, aethiophyllin, $C_{31}H_{34}N_4Mg$, which is probably formed from it by the displacement of the two atoms of hydrogen in the two NH groups shown in the above formula. Perhaps the iron occupies a like position in haemoglobin.

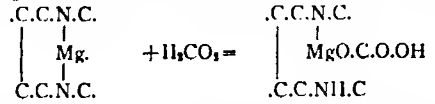
In haemoglobin, the coloured system is loosely coupled with a peculiar protein, globin, present to the extent of 94% in the complex molecule; in the less weighty molecule of chlorophyll, the coloured system is coupled with the wax alcohol, phytol, $C_{20}H_{39}OH$. Both appear to be derivatives of dicarboxylic acids: the disposition of the CO_2H groups in haemoglobin is not clear but probably they are in connexion with the globin; in chlorophyll, one is neutralized by methyl, the other by the phytol radicle. Chlorophyll, unlike haemoglobin, is associated, in most plants, with an enzyme, by which it is hydrolyzed into phytol and the carboxylic acid, chlorophyllid; not only may the action be reversed (to the extent of 65%) but if hydrolysis be affected, in presence of either methylic or ethylic alcohol, methyl or ethyl takes the place of the phytol radicle. The behaviour of the enzyme is precisely that of the enzyme lipase towards fats and towards mixtures of fatty acids and alcohols. Alkalies convert chlorophyll into the corresponding dicarboxylic acid, from which the magnesium is easily displaced by hydrogen by means of acid:—

$$[MgN_4C_{32}H_{30}O](CO_2.C_{20}H_{39})+2OH_2=[MgN_4C_{32}H_{30}O](CO_2H)_2+CH_3.OH+C_{20}H_{39}.OH$$

The special activities of haemoglobin and chlorophyll are in no way accounted for, at present, by what is known of their structure: colour apparently is of no consequence in the former but it is held to be the prime factor in the functional activity of the latter. Presumably both act as particulate agents, in virtue of their high molecular weights, not in solution. The oxygen-holding power of haemoglobin is commonly ascribed to the iron and it is supposed that the gas enters actually into combination with the molecule; whilst the former is mere matter of opinion, the latter view is supported by evidence, *i.e.* by the fact that the formation of oxyhaemoglobin involves the addition of a definite proportion of oxygen. Chlorophyll is not known to behave in a similar way towards carbon dioxide. Willstätter has shown, however, that when the gas is passed into water in which chlorophyll is suspended, this is converted into phaephylin, the magnesium being wholly displaced, as indicated by the equation

$$C_{55}H_{72}O_5N_4Mg+2H_2CO_3=C_{55}H_{74}O_5N_4+Mg(CO_3H)_2$$

The action may be stopped halfway, when apparently the magnesium is only half dissected out of the molecule and is retained, perhaps, together with an added molecule of carbon dioxide, thus



On the assumption that such a mechanism is operative, it is possible to understand how the carbonic acid is brought into the circuit of change and under the direct influence of the pigment. The acid would be at a maximum concentration at the surface of the particles. The acid radicle MgO.CO.OH would necessarily be a terminal point from which electrolysis could proceed: so that if, on exposure to light, a photoelectric wave were propagated from this point, throughout a circuit in which acid-water was included, the water would be electrolysed and the carbonic radicle might well be subjected to the attack of hydrogen ions and reduced, ultimately to formaldehydrol, chlorophyll being regenerated in the process. The correlative product of electrolysis would be hydrogen peroxide ($2OH_2=2H+H_2O_2$).

The evolution of oxygen from the plant in such case would be the consequence of the decomposition of hydrogen peroxide, perhaps by a "catalase." That evolution of oxygen and reduction of carbonic acid are coincident phenomena can scarcely be doubted, as the gas is only produced in presence of the acid and the volume liberated is proportional to that of the carbon dioxide absorbed. It is conceivable that one of the chlorophyll components may play the part of a catalyst, even that the more oxidised may act as platinum black, in the manner Willstätter has suggested: but these are all matters of mere surmise at present. Maybe a more complex circuit is formed than that postulated, one in which perhaps a depolarizer is included; these are all points, however, which must be left for further inquiry.

It is conceivable that the function of iron in haemoglobin is similar to that pictured of magnesium in chlorophyll: that the iron atom becomes partially separated from the molecule, owing to the formation of a perhydrol radicle, similar to that postulated by Willstätter as the active agent in platinum black and as operative in ferrous sulphate perhydrol.

Whatever the process it is to be supposed that formaldehydrol [$CH_2(OH)_2$] is the initial product of the assimilation of atmospheric carbon dioxide by the plant; no other explanation that will meet the facts has been advanced. No laboratory proof that carbonic acid can be reduced and "sugar" produced in minute amount, however, is of the least value in enabling us to understand the origin of life. We have to account not for the formation of sugar but of one of the several not to say many possible isomeric forms as a fundamental structural unit: to explain why of the two glucoses of like structure but enantiomorphic—*i.e.* related to one another as an object is to its image or one hand to the other—both of which are produced simultaneously in equal amounts when the synthesis is effected under artificial conditions, *only the one is formed within the plant.* What act or accident determined such selection, it is impossible to say; whatever happened, the future course of natural action was limited thereby to one type of symmetric material—to the one-handed forms, in genetic relationship with that first selected. Innate peculiarities, only dimly perceptible at present, are also operative in restricting the number of the primary constructive units. It is a remarkable fact that formaldehydrol gives rise to a hexose almost directly, yet it is to be supposed that condensation takes place gradually. In presence of weak alkali it rapidly gives rise to both fructose and sorbose; other products are formed which have not yet been identified; no intermediate products have been reported, such as are formed forthwith undergo further change. The product of the interaction of two molecules would be glycollic aldehydrol:—

$$CH_2(OH)_2+CH_2(OH)_2\rightarrow CH_2(OH).CH(OH)_2+OH_2$$

This is a known substance: it has been shown to give rise to the same hexose as formaldehydrol under the influence of alkali. If three molecules of formaldehydrol were to interact directly or glycollic aldehydrol were to be attacked by formaldehydrol, two

trioses might be formed, glyceraldose and glyceroketose; thus

$$CH_2(OH)+CH_2(OH)_2 \rightarrow CH_2(OH).CH(OH).CH(OH)_2+OH_2$$
$$CH(OH)_2 \qquad \rightarrow CH_2(OH).C(OH)_2.CH_2.OH+OH_2$$

Both compounds are known: they are easily obtained by oxidising glycerol, $CH_2(OH)\text{-}CH(OH).CH_2(OH)$. In solution, in presence of a trace of alkali, the one is rapidly converted into the other: consequently a solution made from either is a mixture of the two in equilibrium; but as the molecule of glyceraldose is asymmetric, this compound is present in two forms of opposite optical activity:—

$CH_2.OH$	$CH_2.OH$
$HC.OH$	$HO.CH$
$CH(OH)_2$	$CH(OH)_2$

Fructose and sorbose, the two ketohexoses obtained in laboratory operations, in the manner described, whether from formaldehydrol, glycollic aldehydrol or the complex triose mixture referred to, are constituted as represented by the formulae

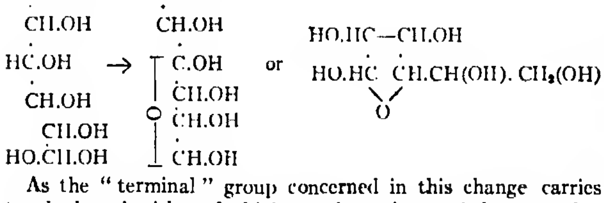
$$CH_2(OH).CO.\overset{H}{\underset{OH}{C}}.\overset{OH}{\underset{H}{C}}.\overset{OH}{\underset{H}{C}}.CH_2(OH) \qquad CH_2(OH).CO.\overset{H}{\underset{OH}{C}}.\overset{OH}{\underset{H}{C}}.\overset{H}{\underset{OH}{C}}.CH_2(OH)$$

Fructose — Sorbose

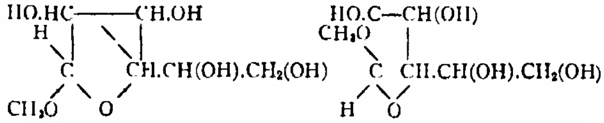
The formation of the two isomerides is accounted for, and is indeed to be expected, on the assumption that the condensation is effected equally between glyceroketose and each of the two oppositely active forms of glyceraldose, which would necessarily be present in equal proportions: for the same reason each isomer would be produced in its two forms of opposite optical activity. It is a remarkable fact, therefore, that whereas fructose is of universal occurrence in plants, sorbose is very rarely met with: this is one of the many indications that in plants the course of synthesis is narrowly directed.

It is conceivable that if six molecules of formaldehydrol were brought into position side by side and condensation took place throughout the series, all the possible hexoses might arise, through the fortuitous arrangement of the molecules in the many possible ways. The force of the argument is lessened by the probability that affinities would come into play which would determine arrangements in particular ways; probably the number would be less than is conceivable but yet greater than it actually happens to be. This conclusion, however, but serves to confirm the argument used above as to the actual course of the process: that it is essentially a live stage process. Perhaps in nature, at least, pentoses may be formed directly, but to judge from laboratory experience it is equally if not more probable that the hexoses are the only primary products and that other simple carbohydrates are derived from them: in other words that the hexoses are both primary products and reserve materials.

The preferential formation and the superior stability of the *hexose* system is to be referred to certain peculiarities of structure which are probably innate in the component elements. It has long been held that the aldehydic sugars are not true aldehydes and the ketonic not true ketones; they are too inert in behaviour to pass as such. The true aldehydrols and kethydrols, if present at all, enjoy but a fleeting existence in solution; their place is taken by closed chain derivation. Thus:—



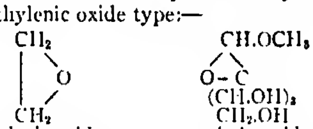
As the "terminal" group concerned in this change carries two hydroxyls either of which may be active, and the group becomes asymmetric in the course of the change—a new asymmetric system being created in the molecules,—it is to be foreseen that two isomeric compounds will arise in this way. As a matter of fact "glucose" is known to be an equilibrated mixture of an a and b form, differing in optical activity and other ways, which can be separated. If either be redissolved in ordinary water it soon passes over into the other until equilibrium is again reached. If hydrogen chloride be added to a solution of glucose in methylic alcohol, after a time two methyl-glucosides can be separated, an α and a β form:—



These are neutral, very stable compounds as compared with the parent glucoses. They are the prototypes of a large class of glucosides met with in plants and may be hydrolysed by enzymes which attack these latter. Hence it is possible to classify glucosides generally, in so far as they can be hydrolysed by enzymes which hydrolyse either α or β methylglucoside and can thus be correlated with either the α or the β form of glucose. The enzyme maltase or α-glucase, present in yeasts, is used in characterising α-glucosides, the β-glucase in almond emulsin in characterising β-glucosides.

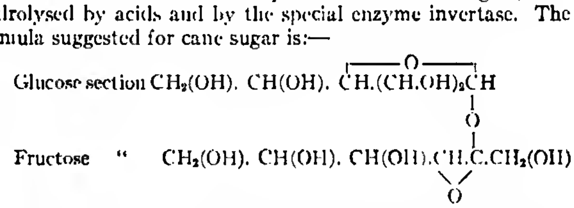
All sugars of the aldose and ketose types behave as described. The fructose sugars exist as condensed stable systems similar to that of glucose and, therefore, should persist, if formed when formaldehydrol undergoes change and is converted ultimately into hexose sugars. Their non-production gives further weight to the argument that these latter are formed from the trioses.

Recently a third or γ form of methylglucoside has been found in the mixture obtained by the interaction of glucose and methylic alcohol. This new glucoside is very different from the α and β forms; it is easily hydrolysed and easily oxidized by permanganate and very active in other ways. Probably it is a condensed system of the ethylenic oxide type:—



Ethylenic oxide — and glucoside

The discovery is of primary importance, as it has led to the discovery of a similar form of fructoside and has given the clue to the nature of cane sugar, long remarkable on account of the extreme ease with which, in comparison with other sugars, it is hydrolysed by acids and by the special enzyme invertase. The formula suggested for cane sugar is:—

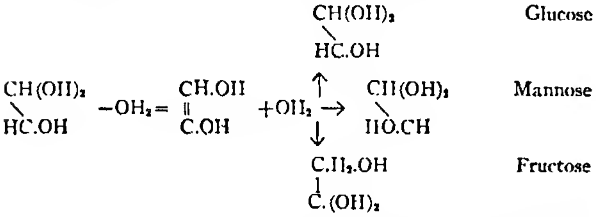


The difficulty in accepting this interpretation is that sugar is shown as either an α or a β-glucoside and that it is hydrolised only by a specific enzyme, not by either α or β-glucose. There can be little doubt that the fructose element is present in the γ form; if the glucose were also in the γ form the peculiar behaviour of cane sugar towards acids would be even better explained.

Although, in the laboratory, the sugars obtained from formaldehydrol are the two ketoses, fructose and sorbose, in the plant glucose plays the preponderating part to a remarkable extent. Only three of the sixteen possible hexaldoses and two ketoses, glucose, mannose, galactose, fructose and perbose, are met with as such or in combination in plants. Three of these are reversibly interrelated—glucose, mannose and fructose. If a solution of any one of the three be made alkaline and kept, gradually the other two make their appearance. A natural process is at work which seems to assure even the rapid passage of any one of the three into the others. It has been shown that, during fermentation with the aid of the juice expressed from yeast, an enzyme—phosphetose—is active, which, in presence of phosphate gives rise to a diphosphoric glucoside, $C_6H_{10}O_4(PO_4P_2)_2$, the result is the same whether mannose, glucose or fructose be taken, but when

this glucophosphate is hydrolysed only fructose is recovered. It is noteworthy that phosphoric acid has a determining influence on the plant, especially during the ripening period: it may well be one of its functions to promote the interconversion of carbohydrates in the manner indicated; if it can convert glucose into fructose it should be able to produce the contrary change, and so supply the material for producing either starch or inulin.

The actual change in an alkaline solution is pictured as involving the production, by dehydration of an unsaturated "enolic" compound common to the three hexoses and the conversion of this by dehydration, only in part into the original form and in part into the other two. The process is one apparently which plays a preponderating part in the course of vital changes. The alteration is only in the first and second carbon systems of the sugar; the manner in which it takes place is simple, thus:—



It has been pointed out that, in the laboratory, sorbose is formed together with fructose, when formaldehydrol is condensed, and that it is of rare occurrence in nature: if changed in solution as fructose is changed it would be converted into the sugars idose and gulose, but neither of these is met with. This fact and the rarity of sorbose is further proof that the vital synthetic process is narrowly controlled.

It remains to account for the production of galactose, which is very widely distributed and probably always present in plants, in small amount (as raffinose); this hexose is characteristic of mammalian milk, being coupled with glucose in milk sugar. Galactose is closely related to glucose: to account for the conversion of one into the other, it is necessary merely to assume that the glucose is resolved, by hydrolysis, into two molecules of glyceraldose, one of which is then changed in sign by the reversal of the position of the median OH group—a change known to occur in solution; if the two molecules of opposite activity were then reassociated through the agency of a directing mechanism the change might well be complete.

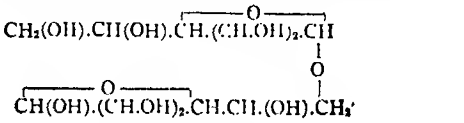
Two pentoses are commonly met with in plants but only in combination, the one *d*-xylose, corresponding to glucose, the other, *l*-arabinose, to galactose; a third, *d*-ribose, is also found, which is the only pentose normally present in animal tissues, in both cases as a characteristic constituent of the nucleic acids. Arabinose and xylose are important components respectively of the gums and of straw and wood; at present, there is no clue to the manner in which they are formed from hexoses in the plant, if indeed they are so formed: it is not improbable that an oxidation process may he at work, by which the $CH_2.OH$ group is removed from the hexose molecule whilst it is held in combination at the aldose end.

The higher carbohydrates are made up of hexose and fructose units in ways which we are only beginning to know: in fact, starch, cellulose and inulin are the only three of whose complete anatomy we have learnt anything, and the information does not carry us far. The labour involved in such work is immense, and methods of dissection are few. The most informative is that introduced by Purdie and developed by Irvine and his school, involving the methylation of the carbohydrate, the resolution of the complex into the constituent hexose fragments and the determination of the position taken up by methyl radicals in these: whence it is possible to infer, with more or less certainty, the manner in which the fragments were linked.

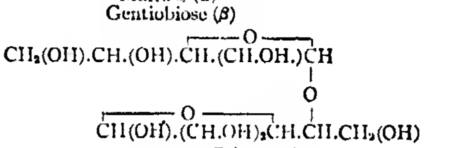
Whilst the primary unit of starch is glucose, into which it is resolved when completely hydrolysed, the chief secondary unit is the dihexose maltose, which is obtained as main product when starch is hydrolysed by the enzyme diastase; whether the subsidiary more complex product, dextrin, is also composed of maltose units is uncertain. Maltose is formed by linking two molecules of glucose in direct apposition.

The primary unit of cellulose is also glucose; the secondary unit, however, is a dihexose isomeric with maltose, cellose, differing from the former in that the two glucose bricks are laid, as it were, the one advanced a sixth of its length beyond the other. Moreover, the one is an α-glucoside hydrolysed by maltose; the other apparently is a β-glucoside, as it is hydrolysed by emulsin. A third diglucose is known in gentiobiose, which is obtained, together with cane sugar, when the trihexoside gentianose from gentian root is hydrolysed by invertase; it is not only hydrolysed by emulsin but has been reproduced from glucose by the action of this enzyme; it is therefore undoubtedly a β-glucoside, and probably the β-glucoside alternative to the α-glucoside, maltose.

The formula of the three sugars may be written as follows:—

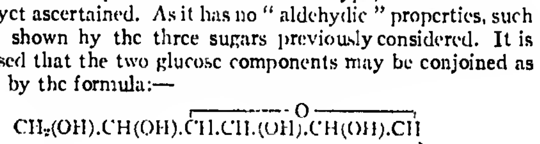


Maltose (α)
Gentiobiose (β)



Cellose (β)

Trehalose, a gluco-dihexoside widely distributed in fungi, appears to be the representative of the third type, but its structure is not yet ascertained. As it has no "aldehydic" properties, such as are shown hy the three sugars previously considered. It is supposed that the two glucose components may be conjoined as shown by the formula:—



It is to he expected that such a compound would be hydrolysed either by maltase or by emulsin; such is not the case but it is resolved by a special enzyme present in fungi which appears to be peculiar to the sugar. The examples given may suffice to illustrate the manner in which hexose units may be linked together.

Inulin, the reserve material of the artichoke and dahlia tuber, is entirely composed, apparently, of fructose units in the γ-form. When acetylated it gives rise to a well-defined crystalline triacetate, which is clearly a simple derivative of the parent substance as inulin may be reproduced from it by careful hydrolysis. The determination of the molecular weight of this compound shows that it contains nine fructose units—a peculiar number.

In some plants, the monocotyledons especially, the place of starch is taken hy cane sugar, little if any starch being formed; even in those in which starch is produced in considerable amount cane sugar is always present in the leaves, and it has heen argued that cane sugar rather than starch may well be the primary product of assimilation. It is difficult at present to offer any rational explanation of the formation of cane sugar; the wish would he to regard it as traceable to enzyme activity.

All attempts hitherto made to synthesize cane sugar have been failures; it is completely hydrolysed by invertase. Either the point of equilibrium is so near to that of complete hydrolysis that it escapes detection, or the immediate products at once undergo change in solution and cease to be susceptible to the revertive influence of the enzyme: the fact that fructose is present in the γ-form in cane sugar and that this form does not persist in solution, either in fructose or dextrose, may not be without bearing on the problem. It is a matter of interest that cane sugar is usually present in leaves in considerable amount in the cellsap and together with invertase, but in some way separated from it.

maybe means are provided by which the sugar can escape from the influence of the enzyme immediately it is produced. In roots such as that of the sugar beet, in which cane sugar is merely stored up as a reserve material, no enzyme is present.

The close association, in the leaves of many plants, of starch with chlorophyll, in the chloroplasts, has led to the view that it may be an all but direct product of synthetic activity and not formed from glucose. It is indeed conceivable that a directive (enzymic) mechanism may exist which can induce both the production of glucose from formaldehydrol and the simultaneous assemblage and union of the glucose units into starch.

The enzymes are agents comparable with the acids in their hydrolytic activity, but selective and directive. Unlike the acids they are catalysts—particulate agents. The effective area of the enzyme, however, must be some small section of the molecular surface: and the only rational interpretation of the special activity of the enzyme would seem to be that this active area is composed of material compatible with that which the enzyme specifically attacks—that indeed it is this material, though conjoined perhaps with an acid radicle, which acts as the actual "tool" in hydrolysis. Starch may be regarded as a pavement or simple mosaic built up of many separate glucose-residues regularly arranged in a definite pattern, and layer after layer is laid in this fashion: the enzyme as a template formed of a single layer thus composed; maybe as the starch layer increases in thickness there is a coincident up-growth at its margin of the protein constituent of the enzyme complex. Given such a mechanism, it is conceivable that starch might be almost directly produced: some explanation is required to account for the preponderance of glucose in the plant. The conception is one, moreover, which may be used to explain the action of enzymes in other cases.

With reference to the conditions under which enzymes (and acids) may act reversibly, it is to be noted that the manner in which action takes place, both rate and direction, is determined by the conditions of concentration. As hydrolysis proceeds water is used up; if the reverse action take place, water is produced. Usually a point of equilibrium is reached, when no further change seems to be taking place. This is true even of the hydrolysis of cane sugar by acid: as the concentration of the solution is raised and the opportunity for change is increased, the rate of change only rises up to a certain point, beyond which any further increase in concentration only serves to diminish the rate of the process. As the solution becomes more concentrated—in the case of cane sugar, particularly through the increase of the number of molecules in solution—it becomes itself more attractive of water and hydrolysis is less promoted. The extent to which synthesis is effected is entirely a question of balance of affinity—of desire for water. This point is one of extreme importance in connexion with vital phenomena. In plants, during the day time, synthetic actions prevail, as the tendency is constantly towards the concentration of the solutions in the leaf cells; when the influence of light is withdrawn water is attracted into the concentrated solutions and reversals set in, producing to an increased extent simpler molecules, which can wander out into the general circulation and be used elsewhere.

Thus far enzymes have been spoken of as influencing the hydrolysis and formation only of compounds consisting of sugar units—these are conveniently classed as *Hologlucosides*. Many sugar derivatives are known which are to be classed as *Heteroglucosides*, being of more diverse origin: the methylglucosides may be taken as typical of this class, especially β-methyglucoside, as most of these are more or less readily hydrolysed by the constituent of the mixture of enzymes in almond-emulsin to which β-methyglucoside responds. Curiously enough, the few known natural α-glucosides are all hologlucosides; the known α-heteroglucosides are all laboratory products.

The heteroglucosides are extraordinarily varied in composition. Little is known as to their precise function. Often they serve to give stability to a substance which could not well exist uncombined; or they mask one that would interfere if free; or they have the advantage of being far less soluble than the parent compounds. They form most of the colouring matters of flowers.

The most interesting member of the class perhaps is that first studied, amygdalin, present in considerable quantity in the fruit of the bitter almond and also in the fruit of most of the Rosaceae. It is resolved by emulsin—which is equally well obtained either from the sweet or the bitter almond—into two molecules of glucose, one of benzoic aldehyde and one of hydrogen cyanide:

$$C_{20}H_{27}O_{11}N + 2H_2O = 2C_6H_{12}O_6 + C_7H_6O + HCN.$$

The two latter are present in direct association, as in the cyanhydrol, $C_6H_5CH(O.H)CN$ in its dextro-rotatory form, the isomeric laboratory form being present in sambunigrin, from elder leaves—which, however, contains only one glucose residue. By the action of one of the enzymes in emulsin, amygdalase, amygdalin is resolved into glucose and prunasin, the isomeride of sambunigrin; this heteroglucoside occurs naturally in the leaf of the almond and of the common cherry laurel—in fact, in the leaves of all Rosaceae whose fruits contain amygdalin. Laurel leaves particularly are rich in an enzyme, prunase, which hydrolyses prunasin; this is present together with amygdalase in all fruits containing amygdalin. The resolution of amygdalin therefore, involves, it will be seen, the action of two enzymes in succession. What appears to be amygdalase is present in some yeasts, together with maltase. The advantage to the plant is that the leaf contains the more soluble glucoside, that in the fruit being but slightly soluble; the presence of glucose and fructose in the leaf and stem but of starch in the tuber of the potato is a parallel case. How the two glucose residues are united is not determined: the probability is that amygdalin is derived from gentiobiose. Prunase apparently is the β-glucase in emulsin which acts on the β-methyglucoside and the β-heteroglucosides generally: to explain its indifference towards amygdalin and the varying degree of activity which it displays towards different β-glucosides, it is necessary to assume that the group associated with glucose influences the fit of the enzyme. If the enzymes be, as suggested, but replicas, in part, of the hydrolytes they effect, in each particular class, the glucoside characteristic of the class may well be contained in the enzyme: thus prunase from the Rosaceae is conceivably a prunasin derivative, whilst the linase of the Linaceae may be a derivative of the cyanhydrol of acetone, $C(CH_3)_2\,(OH).CN$; consequently although both enzymes affect prunase they do not act with equal readiness; the addition of a second molecule of glucose to prunase, although it happens in the β-position, may spoil the fit of prunase, entirely. The problem is one of extraordinary interest and importance.

Glucose and its congeners are of special value in the plant, as constructive materials, on account of their peculiar plasticity under the numerous enzymic and other influences simultaneously brought into action in nature. These are specially manifest in the phenomena of fermentation. In recent years the controversy which has long been waged over the fermentation process, as effected by yeast and other organisms, has been settled against the *vitalists*, as it is proved that it can be carried out *apart from the living cell*, in its entirety, by means of the juice expressed from yeast, and even in presence of substances, such as acetone and toluene, fatal to the life of the cell. The course of change is by no means ascertained: as yet only the main outlines are marked out, but these are of such significance that it is clear that a most delicate balance of forces comes into play.

When the formulae are contrasted it is obvious that the ultimate conversion of glucose into carbon dioxide and alcohol must involve much rearrangement within the molecule. Oxygen must be removed from some of the carbon atoms and its place taken by hydrogen; the reverse operation has to be effected at others. That such changes can be induced by mere contact with acids or alkalies is well known: thus lactic acid, $CH_3.CH(OH).CO_2H$, is easily formed by digesting glucose with alkali; reduction is carried still further in the production of laevulinic acid, $CH_3.CO.CH_2.CH_2.CO_2H$, by boiling either fructose or glucose with an acid, fructose being the far more easily attacked. This latter fact is perhaps not without significance.

A variety of factors come into play when fermentation is induced by yeast juice. Phosphate plays a part of fundamental

importance. When a suitable quantity of a soluble phosphate—best in the form of a solution of disodium phosphate saturated with carbon dioxide—is added to a slowly fermenting mixture of the juice with glucose, a rapid rise is observed in the rate of fermentation, as measured by the amount of carbon dioxide evolved. As change proceeds, the amount of free phosphate in solution diminishes up to the point at which the rate of change begins to diminish; the diminution has been traced to the formation of a phosphoric glucoside. Apparently, action takes place as expressed in the equation:—

$$2C_6H_{12}O_6+2PO_4HR_2=2CO_2+2C_2H_6O+2H_2O+C_6H_{10}O_4(PO_4R_2)_2;$$

that is to say, while one molecule of sugar is fermented a second is fixed as phosphate. Apparently, however, all the sugar passes through the phosphate stage on its way to fermentation; as this slackens and finally ceases the amount of free phosphate in solution steadily rises, the action being reversed the while:—

$$C_6H_{10}O_4(PO_4R_2)_2+2H_2O=C_6H_{12}O_6+2PO_4HR_2.$$

The formation and destruction of the phosphate are changes due to the action of an enzyme, hexosephosphatase.

The point of importance to be noted is, that whatever sugar be fermented—glucose, mannose or fructose—the hydrolytic product is fructose: one function, at least, of the hexosephosphatase would seem to be the presentation of the sugar to the resolving mechanism in the form most sensitive to rearrangement.

The resolving mechanism has several components. It contains one or more enzymes easily destroyed by heat, together with a so-called co-enzyme which survives when the liquid is boiled. These may be separated by mere filtration, under pressure, through a film of gelatin supported in a Chamberland filter-candle: neither residue nor filtrate alone will condition fermentation, but when they are reunited a mixture is obtained which is almost as active as the original fluid. Little, if any, light has been thrown on the nature of the resistant constituent: the most suggestive observation made is that it disappears from boiled yeast juice when this is digested with castor-oil lipase, an enzyme which hydrolyses fats and similar substances.

As to the course of change at some stage apparently the hexose molecule is resolved into two "halves," but whether before or after rearrangement is uncertain. There is, however, reason to suppose that the production of alcohol involves the prior production of aldehyde and the ultimate reduction of this latter. The formation of aldehyde is attributed to that of pyruvic acid, $CH_3CO.CO_2H$, which is resolved into carbonic acid and aldehyde by the action of *carboxylase*, an enzyme normally present in yeast:

$$CH_3CO.CO_2H+OH_2=CH_3.COH+CO_3H_2.$$

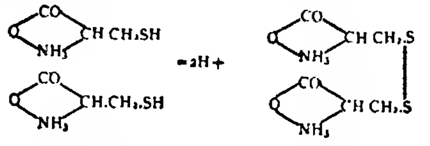
Not only has this acid been obtained as a product of fermentation, but when fermentation is effected in presence of an excess of alkaline sulphite an amount of aldehyde is produced approaching that to be expected on these assumptions, if one half the molecule were so affected; at the same time, glycerol is produced in almost corresponding amount.

It seems probable, therefore, that in the ordinary fermentation process the hexose is normally resolved into a mixture of glyceraldose and glyceroketose, which became rearranged into pyruvic aldehyde, by enolisation and rehydration. The oxidation of these two molecules of aldehyde to pyruvic acid might then conceivably be the consequence of the reduction of two molecules of ordinary aldehyde to alcohol—the reduction of these must in some way be accounted for, if acetaldehyde be an intermediate product of fermentation. As a matter of fact, the function of an ordinary hydrolytic enzyme is nearly of this order, involving as it does either the separate presentation of the H and OH of water at two contiguous regions in a molecule or their withdrawal from two contiguous molecules, according as its action is either hydrolytic or synthetic. A directed interaction of the character contemplated is therefore not improbable. Not only is yeast known to contain the enzyme carboxylase which fits pyruvic acid, but also another enzyme, *glyoxalase*, by which pyruvic aldehyde is converted into lactic acid, an operation involving (1) hydration, (2) enolisation, (3) reversed rehydration, starting from the aldehydrol $CH_3.CO.CH(OH)_2$: $CH_3.C(OH)_2.CH(OH)_2$

$CH_3.C(OH)=C(OH)_2$ $\quad$ $CH_3.CH(OH).CH(OH)_2$.

That the yeast complex may do all the things suggested is, therefore, by no means improbable. Glyoxalase, it may be added, occurs in various animal tissues, and the lactic acid formed as the result of muscular action may well be produced under its directive action. A striking observation made with yeast juice is that the action stops on adding hydrogen cyanide but recommences when this is removed. Yeast ceases to decompose hydrogen peroxide when the cyanide is added. Maybe, in both cases either an oxidase or a peroxydase is held in check which is effective in the pyruvic change.

A discovery of great significance, as throwing light on the reductive stage, is that recently made by Gowland Hopkins, of a minute constituent of yeast juice, liver substance and muscular tissue, glutathione, a neutral derivative (dipeptide) formed by the condensation of the two amino-acids, cysteine and glutaminic acid. It is a powerful reducing agent and acts as a carrier of hydrogen; cysteine is a sulphur derivative of alanine and is readily converted into cystin, by oxidizing agents; moreover, the change is reversible.

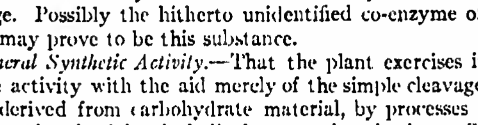


Cysteine $\qquad$ Cystin

Glutathione apparently is but cysteine weighted by glutaminic acid, and its activity is doubtless the consequence of a similar change. Possibly the hitherto unidentified co-enzyme of yeast juice may prove to be this substance.

General Synthetic Activity.—That the plant exercises its synthetic activity with the aid merely of the simple cleavage products derived from carbohydrate material, by processes similar to those involved in alcoholic fermentation, is clear. The adjuncts are merely atmospheric oxygen and various materials obtained from the soil—especially ammonia phosphoric acid, magnesium and silicon; these are all of structural significance; in addition, iron and manganese, calcium and potassium, appear also to be indispensable, but are mainly, if not entirely, of value as functional agents. Although it is established that potassium is essential to the formation of starch, if not of other carbohydrates, no clue has yet been found to the office it exercises. Sodium, being there, is taken into the plant; whether it be in any way necessary, as it is to the animal, we do not know.

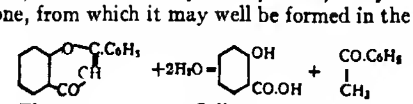
Whilst many compounds are undoubtedly formed under enzymic influences, others are products of the direct spontaneous interaction of materials which happen to meet. The precise manner in which even the simple benzene derivatives met with in plants are formed is not yet clear. That even substances so complex as the opium and other alkaloids may be formed, without difficulty, is shown by R. Robinson's remarkable observation that tropinone, a compound closely related to one group of these alkaloids, is produced when the aldehyde of succinic acid, methylamine and acetone, or still better its dicarboxylic acid, are merely brought together, in aqueous solution, at the ordinary temperature:—



Succinic aldehyde $\quad$ Acetone $\quad$ Methylamine $\quad$ Tropinone

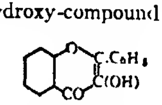
Plant Colours.—Considerable diversity in character may be the outcome of small differences in chemical structure: this is well illustrated in the colouring matters of flowers which, it is well known, vary over a considerable range. The yellows, however, appear all to be derivatives of a simple compound, not itself coloured, flavone, which occurs as a mealy deposit on the leaves and flower stalks of a large number of ***Primulaceae***. It is resolved,

by hydrolysis, into the two simple compounds, salicylic acid and acetophenone, from which it may well be formed in the plant:—

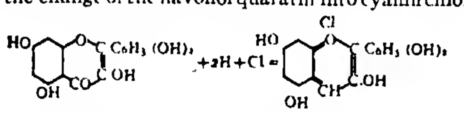


Flavone Salicylic acid Aceto-phenone

The plant yellows are hydroxy-derivatives of flavone, varying in the manner and position of the hydroxyl groups; but whilst some are flavones in which these groups are contained only in the benzene sections of the molecule, others are flavenols, *i.e.* derivatives of the simple hydroxy-compound



The plant colouring matters other than the yellows which are now generally grouped as anthocyan colours, are derived from the yellows by a very simple process—merely by reduction, a process, however, which involves their conversion into derivatives of ortho-quinone, as shown by the following equation representing the change of the flavonol quaratin into cyanin chloride:—



The colour produced by an anthocyan depends not only on the number and position of the hydroxyl groups but also on its condition in the plant cell—whether it be present in combination with acid or as a salt.

Nuclear Materials.—Substances which play a determining part as structural elements, if not as functional agents, are far more complex. The nucleic acids are the chief. Nucleic acid, from yeast or the wheat embryo, for example, which has the formula $C_{38}H_{49}O_{29}N_{15}C_4$, may be resolved into four sections known as nucleotides, all of which have been isolated and studied of late years, particularly by the American chemists, Levene and others. Each of these nucleotides consists of the peculiar pentose, ribose, associated, on the one hand, with phosphoric acid, on the other, with a purine base (a compound of the uric acid series), the two former being common to all four sections but each having its special basic constituent, namely, one of the following:—

```
N=C.NH2          HN—CO            N=C.NH2     HN—CO
|  |             |  |             |  |        |  |
HC C—NH          HN:C  C—NH       OC  CH      OC—CH
    \                  \
‖  ‖   CH         |  ‖   CH        |  ‖        |  ‖
    //                 //
N—C—N            HN—C—N           HN—CH       HN—CH
Adenine          Guanine          Cytosine    Uracil
```

Nucleic acid of animal origin contains a hexose in place of the pentose, ribose; moreover, the basic elements are not all the same, methyluracil (thymine) taking the place of uracil.

The formula assigned to plant nucleic acid is:—

```
     HO
       \
        OP.O.C5H7O3. C5H4N5O
        |      |     Guanine unit
        HO     O
    HO         |
      \        |
       OP.O.C5H6O. C4H4N3O
       |       |    Cytosine unit
       HO      O
    HO         |
      \        |
       OP.O.C5H6O. C5H4N5
       |       |    Adenine unit
       HO      O
    HO         |
      \        |
       OP.O.C5H7O2. C4H3N2O2
       |               Uracil unit
       HO
  Phosphoric     Ribose
     unit         unit
```

Complex materials thus constituted, comprising acid, neutral and basic sections, this last of varying structure, obviously must offer numerous attractions such as befit a nuclear substance; probably, however, the phosphoric units are the main functional elements, and it is in these compounds particularly that the special value of phosphoric acid to the living organism is apparent. The nucleins are accompanied by a number of enzymes which, doubtless, are concerned in their formation; these suffice not only to resolve them, when necessary, into their proximate components but also to convert the basic units into uric acid.

The Proteins.—The fundamental phenomena of vital activity are best studied, at present, with the aid of carbohydrate material, because of its greater simplicity; there is, however, every reason to suppose that, in the main, the same considerations apply to the problems offered by nitrogenous materials. The possibilities are more numerous but the lines of action and reaction are of the same order. The contexture and configuration of carbohydrate material cannot be greatly varied; although, as shown in artificial silk, cellulose has strength and a world might be built of carbohydrate material, it would undoubtedly display great poverty of pattern and less colour. The introduction of nitrogen has added enormously to structural variety and strength. Elsewhere the complex carbohydrates have been compared with pavements of simple mosaic; the proteins, which play so large a part, especially in animal life, are more like a jig-saw puzzle.

The proteins are the formative materials of animal structures. They are commonly known in such materials as wheat glutin—easily separated from the accompanying starch by kneading flour in a gently-running stream of water; egg white; milk casein; glue or gelatin; and as the chief constituent of meats. A number of proteins have been obtained in crystalline form, but they are undoubtedly all substances of high molecular weight. Like the higher carbohydrates they can be resolved into simple units by hydrolysis either by acids or by enzymes. They yield a numerous and varied series of fragments; the following is a list of compounds of the glycine type thus far separated from them:—

Glycine $CH_2(NH_2).COOH$
Alanine $CH_3.CH(NH_2).COOH$
Valine $(CH_3)_2:CH.CH(NH_2)COOH$
Leucine $(CH_3)_2:CH.CH_2.CH(NH_2).COOH$
Isoleucine $(CH_3)(C_2H_5):CH.CH(NH_2).COOH$
Serine $CH_2OH.CH(NH_2).COOH$
Lysine $H_2N.CH_2CH_2CH_2CH(NH_2).COOH$

```
                   NH2
                  /
Arginine HN=C
                  \
                   NH.CH2.CH2.CH2CH(NH2).COOH
```

Phenylalanine $C_6H_5.CH_2.CH(NH_2).COOH$
Tyrosine $HO.C_6H_4.CH_2CH(NH_2).COOH$
Aspartic acid $HOOC.CH_2.CH(NH_2).COOH$
Glutamic acid $HOOC.CH_2.CH_2.CH(NH_2).COOH$
Hydroxyglutamic acid $HOOC.CH_2.CHOH.CH(NH_2).COOH$
Cystine $HOOC.CH(NH_2).CH_2S—SCH_2.CH(NH_2).COOH$

```
Proline  CH2—CH2
         |    |
         CH2  CH.COOH
           \ /
           NH

Hydroxyproline  HO.CH—CH2
                   |    |
                   CH2  CH.COOH
                     \ /
                     NH

Histidine  CH
          // \
         N    NH
         |    |
         HC=C—CH2.CH(NH2).COOH

Tryptophane  C—CH2.CH(NH2).COOH
            / \\
         C6H4  CH
            \ /
            NH
```

It is not difficult to account for the formation of such compounds from carbohydrate materials and ammonia. Peculiar to all is the group $CH(NH_2).CO_2H$. The presence of this group is almost certainly a clue to the process by which they are produced, viz. by the action of ammonia on a keto-carboxy-acid. Much has been said above of pyruvic acid: alanine is doubtless formed from this acid by its combination with ammonia and subsequent reduction of the hydroxy-amino acid:—

$$CH_3CO.CO_2H + NH_3 = CH_3.C(OH)(NH_2).CO_2H$$
$$CH_3.C(OH)(NH_2).CO_2H + 2H = CH_3.CH(NH_2).CO_2H$$

In the human circulation amino-acids are converted into oxy-acids—which serve as fuels—by the reverse process. As the amino-acids are optically active substances, like the glucosides, the reduction process must be directed in some way: they belong to one series corresponding to that of the natural sugars.

The name amino-acid, usually given to the protein hydroclasts, is not applicable to the compounds as they exist apart, although they function as such. The names in the above list, which are those usually given, indicate that most of the compounds are basic rather than acid. As a matter of fact, owing to internal neutralization,

$$.CH \begin{cases} NH_2 \\ COOH \end{cases} = .CH \begin{cases} NH_3 \\ CO.O \end{cases}$$

they are all but neutral substances, yet they can act either as acid or base, according to circumstances.

Although obtainable from animal as well as vegetable proteins, all the compounds in the list given, with the exception of the first, are the products of plant activity alone. The office of the animal is to take to pieces the complex structures which are eaten as vegetable food; then, having conveyed them in the blood stream to various parts of the body, to reconstruct them in appropriate special ways. In some cases the units are built up around a phosphoric acid nucleus, particularly in cell nuclei, in brain matter and bone marrow. A number of compounds besides those in the list, even sugars, especially galactose and ribose, are met with proteins.

In the carbohydrates the linkage is etheric—two carbon atoms are joined through the agency of an oxygen atom. In the proteins two carbon atoms are linked together through the agency of a nitrogen atom. An additional peculiarity is the presence of a succession of NH.CH.CO groups, each forming as it were a short link in a chain, each link carrying a side-group—which may vary greatly in character and dimensions—attached to the CH member. A large number of "polypeptides" have been built up in the laboratory, from amino-acids, on such a plan as the following:—

$$\begin{array}{llll} NH_2.CH_2.CO— \vdots & NH.\underset{\displaystyle CH_3}{\underset{|}{CH}}.CO— \vdots & NH.\underset{\displaystyle C_3H_7}{\underset{|}{CH}}.CO— \vdots & NH.\underset{\displaystyle C_4H_9}{\underset{|}{CH}}.CO.OH \end{array}$$

Even octadecapeptides have been prepared, indeed there seems to be no theoretical limit to the number of "links" that may be included in the chain. In this field however, as in that of the carbohydrates, there is reason to believe that nature has been sparing in her selection and choice of patterns. At present, not the least clue to the patterns laid down has been obtained: at most the order followed in some of the smaller fragments obtained from proteins by hydrolysis has been ascertained.

The uniformity that exists could not be reached—the possible permutations and combinations are so infinitely numerous—if selective and directive influences were not at work, of the order of those referred to in discussing the carbohydrates. It would be easy to prepare many unit materials similar to those in use in plants and animals, but there can be no doubt they would not be assimilated as foods. If not poisonous they would either be seized on by glucose molecules and quickly emptied into the urine or got rid of as such; or they would be just thrown into the circulation and burnt up in its fires.

The great advance of modern times, since it became possible to analyse the proteins, is the recognition of the prime fact that a varied and well proportioned diet is essential, if all the structural elements required in growth are to be at disposal. Latterly the even more important discovery has been made that fresh and uncooked foods contain minute proportions of mysterious materials

The analysis of the proteins is a difficult operation and the results are usually but approximations. In the accompanying table, the results of such an analysis are set out. Those quoted are sufficient to show how complex is their composition and how much variation there is in the proportions of the several components.

Like the higher carbohydrates, the proteins may be broken up into a series of compounds of diminishing complexity by means of several different enzymes acting in succession; these proteoclastic enzymes have been relatively little studied and but imperfectly defined. A striking peculiarity of several is that they are active either in strongly acid or strongly alkaline solutions under conditions which render the saccharoclastic enzymes inoperative. This difference is called for probably because of the different way in which the units are linked.

without which healthy growth is impossible. These indispensable agents or advitants may easily be destroyed in cooking and by preserving foods. Thus infants fed on boiled milk alone rapidly develop symptoms of scurvy, but the addition of a little orange or turnip juice is sufficient to meet the deficiency. To explain such facts and a multitude of similar observations is very difficult, yet the discovery of the explanation is of vital importance, as vast quantities of poor food might have its full value restored, if the deficit in advitant could be made good.

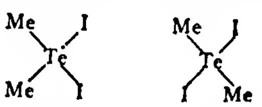
The advitants can scarcely be enzymic agents, as in most cases they withstand more heating than would an enzyme: it is true the antiscorbutic advitant in milk and fresh vegetables is destroyed by heating or drying, but in orange juice survives boiling.

The alkaloid adrenaline, produced constantly in minute proportion, is known to be a regulant of the arterial system in the

human body: therefore, it is conceivable that the advitants are alkaloidal substances or at least substances which exercise regulative functions without being structural elements.

The most suggestive observations of recent times in this direction, however, are those relating to anaphylaxis. If a minute amount of a protein be introduced into the blood stream of an animal, after a certain interval it is rendered so sensitive to the action of the particular protein that if a further amount be injected the animal is killed. A different protein has no lethal effect. In this way a clear distinction can be established between such apparently similar materials as white of egg from the hen and that from the duck. Nay more according to Dakin and Dale—if egg albumin be treated with weak alkali and the treated material be injected into the animal it produces no sensitiveness either to itself or to untreated egg albumin, and animals sensitised by the latter are not affected by it. The effect of alkali, it is known, is to racemise the albumin; that is to say, to bring about a local change such as that which attends the conversion of glucose into galactose; in the albumin only a few centres can be open to such a change, yet its fit is spoilt thereby and it is no longer operative in the system but runs out unchanged in the urine.

Even in the case of adrenaline only the natural form is operative; the optically opposite form—the other glove—has little effect. Attention may be called here to a striking recent observation in connexion with this alkaloid. When tellurium is combined with methylic iodide two isomeric compounds are formed, differing in colour and crystalline form: in itself this is a remarkable result and proof that tellurium has unsymmetric affinities. The two compounds are probably cis- and trans-forms, thus:—



These produce entirely different effects on animals: the one, presumably the trans-form, slows and weakens the heart and the blood-pressure falls. The other, in which the iodine atoms perhaps act together, has the most profound stimulant action on the medulla, giving rise to an increase of blood-pressure and increasing the depth and rapidity of respiration. Generally, before the blood has reached the normal again, a second rise occurs; this is due to the liberation of adrenaline from the supra-renal glands, upon which the cis-compound exerts an unique and specific effect not comparable with that produced by any other known chemical. Large doses of the compound, such as 60 milligrammes to a cat, paralyse the whole nervous system—brain, spinal cord and motor nerves (cf. Vernon, *Journ. Chem. Soc.*, 1921, 108).

This effect may be likened to that of secretin, which according to Bayliss and Starling serves to liberate from the pancreas the proteoclastic enzyme which is active in intestinal digestion.

In fine, whatever the direction in which we look, the influence of structure is paramount and determinative: hence the fixity of our human nature. If organic chemistry teaches us anything it is that no education can alter our mechanism: only changes in the germ can be effective: wherein the patterns are laid down in proteins especially, and so handed on from generation to generation.

(H. E. A.)

CHESTERTON, GILBERT KEITH (1874–), English author (*see* 6.111). More recent works:—*The Innocence of Father Brown* (1911) and *The Wisdom of Father Brown* (1914), both collections of detective stories; *Man Alive* (1912); *The Victorian Age in Literature* (1913); *The Flying Inn* (1914); *A Short History of England* (1917); *Irish Impressions* (1919) and a play, *Magic* (1913), which was produced at the Little theatre, London.

CHEYNE, THOMAS KELLY (1841–1915), English divine and biblical critic (*see* 6.116), died at Oxford Feb. 16 1915. His later works include *The Two Religions of Israel* (1910); *Mines of Isaiah Re-explored* (1912); *The Veil of Hebrew History* (1913) and *Fresh Voyages on Infrequented Waters* (1914).

CHEYNE, SIR WILLIAM WATSON, 1st Bart. (1852–), British surgeon, was born in the Shetland Is. Dec. 14 1852 and was educated at Edinburgh, where he took his degrees in surgery and medicine in 1875. He also studied at Vienna, Paris and Strasbourg. In 1880 he was appointed to the chair of surgery at King's College, London, and from 1888 to 1890 was Hunterian professor of surgery at the Royal College of Surgeons. From 1900 to 1901 he was consulting surgeon to the South African forces. On the outbreak of war in 1914 he became consulting surgeon to the Royal Navy and in this capacity accompanied the British forces to Gallipoli. He was created a baronet in 1908 and in 1916 received the K.C.M.G.

His published works include *Antiseptic Surgery* (1882); *The Antiseptic Treatment of Wounds* (1885); *Lectures on Suppuration and Septic Disease* (1889); *Objects and Limits of Operations for Cancer* (1896); *Manual of Surgical Treatment* (7 vols., 1899–1903); besides various papers on the treatment of wounds in war.

CHICAGO (*see* 6.118).—With a pop. in 1920 of 2,701,705, representing an increase of 23·6% over the enumeration for 1910 (2,185,283), Chicago easily maintained its position as the second city in the United States. While the city's growth was greater proportionately than that of New York, which was 17·9%, it was considerably less absolutely. The percentage of increase was less than in any other decade of Chicago's history. It was likewise smaller than that of Detroit, 113·4%, and Cleveland, 42·1%, Chicago's closest rivals in the Middle West. In 1920 the negro pop. was 109,594, an increase of 148·5% over the preceding census. This influx of negroes, largely from the South, was due to the great demand for unskilled labour, especially in the packing industry, during the period of the World War when the European immigration was slight. A shortage of housing facilities for these negro labourers was one of the underlying causes of the race riots of 1919 in which a number of negroes and whites were killed. Much of Chicago's growth in previous decades had been due to immigration; this was sharply restricted after 1914. By the annexation of suburban territory, the area of Chicago (both land and water) was increased from 191·4 sq. m. in 1910 to 200 sq. m. in 1920.

Industry and Commerce.—The value of manufactures produced in Chicago increased enormously during the decade, the greatest advance being after 1914, as indicated by the following table compiled by the Chicagn Association of Commerce in which, however, the estimates for 1919 are probably too generous: —

LEADING MANUFACTURERS

Industry.	1919 (Estimated)	1914 (U.S. Census)
All industries	$6,500,000,000	$1,482,814,000
Meat packing	3,500,000,000	410,709,000
Iron and steel	600,000,000	27,002,000
Foundry products	265,000,000	85,359,000
Men's clothing	252,000,000	84,340,000
Printing and publishing	203,000,000	97,507,000
Electrical machinery	184,000,000	17,568,000
Agricultural implements	130,000,000	41,000,000
Railway cars	126,500,000	50,931,000
Plumbing, etc.	111,500,000	
Furniture	102,000,000	43,600,000
Timber products	73,000,000	28,711,000
Bakery products	68,500,000	34,217,000
Soap	59,500,000	21,255,000

In 1918 the estimated total for all industries was $4,205,914,000. In 1914 Chicago had 10,114 manufacturing establishments employing 386,794 persons, of whom 313,202 were wage earners. The cost of materials was $793,470,000, and the amount paid in wages $174,112,000. The Chicago packing plants increased their output while the World War was in progress, as the following figures show:—

BEEF AND PORK PACKING IN CHICAGO

	No. cattle.	Nn. hogs.		No. cattle	No. hogs.
1905–6	1,988,955	6,027,432	1915–6	1,962,048	7,256,936
1910–1	1,735,185	6,294,251	1916–7	2,073,553	7,757,726
1914–5	1,442,870	6,079,473	1917–8	2,411,750	6,284,586

The extent of the grain trade is indicated by the following tabulatinn of receipts (bus.):—

	1913	1915	1918
Wheat	50,372,000	70,704,000	69,610,000
Corn	127,773,000	95,357,000	100,409,000
Oats	124,405,000	133,475,000	137,072,000

Bank clearings in 1920 were $32,669,233,535, as compared with $16,198,985,174 in 1915 and $13,939,689,984 in 1910. The combined resources shown by the figures of the Chicago banks in 1920 amounted to $1,883,154,592.

The City Plan.—The most striking feature of Chicago's recent history is the formulation of the plan for the physical reconstruction of the city and the progress of the movement for its execution. This plan had its genesis in a report, issued by the Commercial Club of Chicago in 1909, which was prepared largely under the guiding spirit of Mr. Daniel H. Burnham, Director of Works of the World's Fair of 1893. The first step was the appointment of the Chicago Plan Commission, created by ordinance of the city council, and composed of aldermen and citizens. In furtherance of the Chicago Plan, Roosevelt Rd. (formerly 12th St.) was widened to more than 100 ft. between Ashland Ave. and Michigan Ave., a distance of 2 m., at a cost of $8,303,284. Michigan Ave. was widened to 130 ft. between Roosevelt Rd. and the river and to 141 ft. between the river and Chicago Ave. Widening that part of the street between Randoph St. and Chicago Ave. was a difficult matter, involving the taking of valuable private property, and the construction over the Chicago river of a large two-level bascule bridge. The cost of the Michigan Ave. project was in excess of $16,000,000, paid for out of bond issues and special assessments. The new thoroughfare was opened to traffic in 1920. Other street-widening and street-opening projects were under way in 1921.

The situation with respect to railway terminal facilities had long been unsatisfactory. The fact that Chicago is the greatest railway centre in the world, and that the interests involved were conflicting, made the problem exceedingly difficult. In 1911 the new passenger station of the Chicago and Northwestern railway was opened to service, at a cost of $25,000,000. This station, which is a dignified structure, was the project of a single railway. Other terminal projects authorized later represent greater coöperation, though they materially conflicted in some respects with the ideas of the Chicago Plan Commission.

The railways using the so-called Union Station—the Pennsylvania, the Burlington, the Chicago & Alton, and the Chicago, Milwaukee & St. Paul—had under construction (1921) a new passenger station estimated before the war to cost $65,000,000. The actual cost probably will be nearer $80,000,000. This station is to have a large office building above it. The proposed passenger station of the Illinois Central railway, on the lake front, was planned on a scale large enough to accommodate all the roads—17 in number—using the Illinois Central, Dearborn, La Salle and Grand Central stations. The Illinois Central project also involved a programme of electric operation, beginning with the suburban service in 1927 and including all service, freight and passenger, by 1940. The estimated cost to the railway of the Illinois Central improvement was $80,000,000.

As a part of the combined move for terminal improvement and lake-front development, the Board of South Park Commissioners planned to spend $60,000,000, of which $20,000,000 has been authorized by referendum vote. The board was, in 1921, proceeding to make land by filling the lake outside the Illinois Central right of way, this land to be used for parkways and bathing beaches. The new building for the Field Museum, located on made land on the lake front at the foot of Roosevelt Rd., was completed in 1920 at a cost of $6,000,000, which was provided by the will of Marshall Field. The museum was formerly housed in the old Fine Arts Building, first erected for the World's Fair of 1893, in Jackson Park. The new building opened in May 1921 is 350 ft. wide and 700 ft. long. It is built of Georgia white marble, in the Ionic style of architecture. South of the Field Museum is to be located a large stadium with a seating capacity of 100,000, for which a bond issue of $2,500,000 has been authorized by referendum vote. The outside dimensions of this structure of reënforced concrete will be 2,000 by 1,080 feet. Other important buildings erected or completed during the decade 1910–20 include the following, (name, height in storeys and approximate cost given in order): Atlantic Hotel, 20, $1,400,000; Butler Bros., 14, $1,750,000; Continental and Commercial National Bank, 20, $4,500,000; Fort Dearborn Hotel, 17, $1,100,000; Insurance Exchange, 22, $4,000,000; Karpen, 12, $1,400,000; Lytton, 18, $2,250,000; Mandel (department store), 15, $2,000,000; Monroe, 14, $1,[illegible],000; Morrison Hotel, 22, $2,000,000; North American, 20, $1,[illegible],000; Peoples Gas, 20, $3,000,000; State-Lake, 13, $1,600,000. The present limit of the height of buildings by city ordinance is 260 feet.

One of the most important municipal undertakings of the decade was the Municipal Tuberculosis Sanatorium, consisting of several buildings erected after 1909, in which year a site of 164 ac. was acquired in the north-western part of the city. Its revenues, derived mainly from taxation, amount to more than $1,000,000 a year; in 1920 there were about 1,000 patients. A notable structure, completed late in 1915 at a cost of nearly $4,000,000, is the Municipal Pier. It projects 3,000 ft. into Lake Michigan just north of the mouth of the Chicago river. The outer portion, 660 ft. in length, is a three-decked structure devoted to recreation purposes. Up to 1920 the new pier had not been extensively utilized by shipping interests; the recreation part of the pier, however, proved extremely popular from the outset.

Education, Art and Music.—The school census of 1916, though not completely reliable, was of interest as showing that the total pop., under 21 years of age, in that year was 996,059. Of these 304,547 were of compulsory school attendance age *i.e.* over 7 and under 14 years. Between the ages of 14 and 16 there were 96,949 of whom 15,393 were at work and 885 unaccounted for. The total enrolment in the public schools in 1919 was 377,058 (8,558 teachers); in 1910 the enrolment was 300,893 (6,383 teachers). In 1920 there were 288 public schools, in many of which night courses were given to adults as well as to minors. The number of students registered in the Art School of the Art Institute in 1920–1 was 4,267. The number of visitors to the Institute during the year was 1,100,000.

The trustees of the Art Institute administer the Ferguson Monument Fund, consisting of the income from $1,000,000, left by the will of Benjamin Franklin Ferguson, a Chicago business man, to be used for the erection of enduring statuary and monuments in Chicago. Among others, two notable pieces by Lorado Taft have been purchased; one, "The Fountain of the Great Lakes," stands just to the S. of the Art Institute; the other, "The Fountain of Time," will stand at the head of the Midway, between Washington and Jackson parks.

Chicago was the first American municipality to adopt the policy of giving direct official encouragement to local art by using public funds for that purpose. In 1914, at the suggestion of Mayor Harrison, the city council appropriated $2,500 for the purchase of paintings and works of plastic art, the production of resident artists and sculptors, and an appropriation for this purpose has been made each year since. The purchases are supervised by a commission named by the mayor; it consists of seven members, of whom six are appointed on the recommendation of different art groups of the city, including the Art Institute.

The most notable development in music since 1910 has been the establishment of the Chicago Opera Association, at first known as the Chicago Grand Opera Co. The company gives a 10 weeks' season of grand opera each year in Chicago, five weeks in New York and five weeks in other places.

Parks and Bathing Beaches.—Before 1910 the facilities for bathing in Lake Michigan within the city limits were meagre. In 1921 there were 12 public bathing beaches, 3 maintained by park boards, and the rest by the city government. Clarendon Beach, managed by the city, is the largest. It has nearly 10,000 lockers and has been used by as many as 23,000 bathers in one day. The small park and playground movement, which was well under way in 1910, developed largely in the following decade. In 1920, in addition to several large parks, there were 195 small parks and playgrounds maintained by the city and by park authorities. Outer park areas for Chicago were enlarged by the purchase, beginning in 1916, of wooded tracts in Cook county, nearly all of them outside Chicago, to the extent of 18,028·77 ac.; these tracts are known as the Forest Preserve District. The total purchase price was $7,221,754·78, or an average of $400·57 per acre. The members of the Board of Cook County Commissioners are *ex-officio* the commissioners of the Forest Preserve District. The plans call for the acquisition of about 30,000 ac. all told. A 300-ac. tract of land near Riverside was donated by Mrs. Edith Rockefeller McCormick for the establishment of the Chicago Zoölogical gardens.

Finance.—The city's corporate finances suffered severely from causes incident to the World War, and more particularly from the loss of revenue from saloon licences, which once contributed as much as $7,000,000 annually. A summary of the more important city revenues and expenditures in 1919 follows:—

Purpose.	Revenue.	Expenditure.
Corporate purposes	$32,541,758	$32,084,658
Sinking-funds for bonds	4,324,346	4,200,342
Municipal water-works	8,007,851	6,643,958
Schools	27,701,826	24,167,362
Public Library	847,095	848,764
Municipal tuberculosis sanatorium .	1,054,076	1,287,755
Special assessments (street improvements)	10,757,148	9,449,038
All purposes[1]	129,432,896	99,142,349

[1] This does not include expenditures for the larger parks, for the sanitary district, or for some other purposes which are in the hands of separate taxing bodies. The division of each dollar of taxes in 1918 was as follows: city corporate, 17¼ cents; state, 14¼; county and towns, 9¾; sanitary district, 5½; schools and education, 19; school buildings, 10; parks, 10; tuberculosis sanatorium, 1½; pensions, 2; public library, 1¼; and interest, 9½.

History.—Carter H. Harrison (Dem.), who was elected in 1911 to his fifth term as mayor of Chicago, was succeeded in 1915 by William Hale Thompson (Rep.), who was reëlected in 1919. After the United States entered the World War, Thompson was sharply criticised for various actions that seemed to indicate a reluctant support of the war policy of the Government.

The disappearance from the newspaper field of the *Inter-Ocean* and the *Herald* left Chicago for a time with only two English-speaking morning dailies, the *Tribune* and the *Herald and Examiner*. In 1920 the Chicago *Journal of Commerce* was established as a morning paper for business men, with no Sunday edition. The Joseph Medill School of Journalism was opened in Feb. 1921, with over 100 students, as a part of the Northwestern University. The Chicago *Tribune*, of which Joseph Medill was founder, agreed to underwrite the deficit of the school for a five-year period.

CHICAGO, UNIVERSITY OF (*see* 6.125).—The grounds of the University of Chicago increased between 1908 and 1020 from 60 ac. to 92, so that the university's holdings occupied both sides of the Midway Plaisance continuously for three-quarters of a mile. During the same period new buildings were erected, at an aggregate cost of $2,000,000, for a general library (the William Rainey Harper Memorial), for classics, for geology and geography (Julius Rosenwald Hall), for pathology (the Howard Taylor Ricketts Laboratory), and for a women's gymnasium, refectory and clubhouse (Ida Noyes Hall). Funds amounting to $3,250,000 were in hand in Jan. 1921 for further building projects—a theology building and chapel, the Rawson laboratory for medical research, the Billings hospital (250 beds) and the Epstein dispensary, and the founder's chapel. In 1916-7 funds amounting to $5,461,000 were secured for the development of the medical work of the university, and arrangements were made for the closest coöperation with the Presbyterian hospital, the Otho S. A. Sprague Memorial Institute and the McCormick Memorial Institute. A Graduate School of Social Service Administration, continuing and developing the work previously done by the Chicago School of Civics and Philanthropy, was added to the schools by the university in 1920.

The libraries of the university contained in 1920 685,000 volumes and 200,000 pamphlets. By a novel arrangement of bridges connecting the third floor of the Harper library with adjacent buildings, reading rooms with an aggregate capacity of 900 readers were brought into connexion upon the same level and virtually under one roof. The University Press, the first to be organized under university ownership in the United States, publishes from 30 to 60 books annually, and 11 scientific journals, the *Biblical World* and the *American Journal of Theology* giving way on Jan. 1 1921 to the *American Journal of Religion*. Beginning in 1914 the Meadville Theological School united its summer quarter with that of the Divinity School, and in 1915 the Chicago Theological Seminary (Congregational) became affiliated with the university. While the trustees of the Divinity School were Baptists, theological instruction was given by members of five Protestant denominations to students of every denomination. In celebration of the quarter-centennial of the founding of the university, June 2-6 1916, the university published three volumes: *The Quarter-Centennial Celebration of the University of Chicago, 1916*, by D. A. Robertson; *A Bibliography of the Publications of Members of the University, 1902-1916*, edited by G. J. Laing; and a *History of the University of Chicago, 1891-1916*, by T. W. Goodspeed.

Upon the entrance of the United States into the World War, the President placed the resources of the university at the disposal of the Government for purposes of experimentation and research and for military training, and the members of the university entered actively into war work. President Judson himself led a political and philanthropic mission to Persia in 1918-9, and, in all, 4,355 members of the university, including students, alumni, and members of the faculties were in the service of the Government; 70 of these gave up their lives for their country. Between 1908 and 1920, under the administration of President Judson, the university's total resources more than doubled, and on June 30 1920 exceeded $50,000,000, rather more than $30,000,000 of which was in invested fonds. The members of the faculties numbered 328. Between 1892 and 1920 87,600 students matriculated and more than 12,000 took degrees, 1,200 of them the Ph.D. In 1920-1 the university enrolled 11,479 students. (E. J. G.)

CHILD LABOUR: *see* JUVENILE EMPLOYMENT.

CHILDREN, LAW RELATING TO (*see* 6.138).—In the United Kingdom little actual legislation for child welfare was passed between 1908 and 1920, but an immense work was done by the National Society for the Prevention of Cruelty to Children, which now has branches all over the United Kingdom. The worst as well as the most numerous cases of cruelty take place at home; parents and step-parents are worse than employers. The society, authorized by name in the "Children's Charter" (Children Act 1908), was founded at a meeting at the Mansion House in 1884 and dealt with 95 cases in that year. The number of cases dealt with in the year ending March 31 1921 was 38,174 in England, Ireland and Wales, but this was 16,598 less than in 1913-4. The number of children involved was 101,085. Only 3% of the cases were brought into court. Out of 1,140 prosecutions only 22 failed. The cases are thus divided:—

	Cases investigated.
Neglect or starvation	33,089
Ill-treatment	3,036
Exposure, abandonment, etc.	398
Moral wrongs	541

Cases where improvement took place by warning were 33,757 or 88·4% of the whole. More than half of these cases (22,095) were reported by the general public; reported by the police, 3,205; school officials, 6,584; other officials, 3,036. Discovery by inspectors, 2,354. The children died in 533 cases in consequence of neglect or cruelty.

By the Children Act 1908 any person "over the age of 16 years who has the custody, charge or care of any child under 16 years of age and who causes or procures such child to be assaulted, ill-treated, neglected, abandoned or exposed *in a manner likely to cause such child unnecessary suffering* or injury to its health including injury to or loss of sight or hearing, limb or organ of the body and any mental derangement" can be punished at the Assizes by fine of £100, and two years' imprisonment, with or without hard labour, or before a police magistrate by fine of £25 and imprisonment for six months. The punishment may be ordered although the child be dead. If the defendant was directly or indirectly interested in any money payable on the death of the child (*e.g.* insurance) the fine can be raised to £200 and five years' penal servitude can be inflicted. Restrictions are also placed on employment of boys under 14 or girls under 16 for begging or performing or selling anything in any street, public place, or show (Sect. 2) except under licence if over the age of 10 years. Application for a licence requires the consent of the police and also the Local Education Authority (Rules 1920). A constable may take any child to a place of safety pending trial of an offence under the Act (Sect. 5), and the magistrate may order the detention of the child by a relative, or in a home. After conviction the court can remove the child out of the control of the offender and hand it over to a suitable guardian, including a society. There is also a provision for emigration. The parent of the child can also be ordered to contribute to its maintenance, and any pension or source of income may be utilized and charged for the purpose. The religion of the child is protected (Sect. 8). A search warrant may be issued (Sect. 10) in cases where cruelty to a child is suspected, but the child cannot be communicated with. The magistrate may take the evidence of the child by deposition and not in the open court, on a medical certificate. Evidence of a child of tender years may be taken although the child is not able to understand the nature of an oath, but there must be some circumstance or other person to corroborate such evidence. The court may dispense with the attendance of the child. The onus of proving that the child is older than 16 is (Sect. 7) thrown on the defendant. The prosecution must be within six months of the offence. Besides the offences specified in Sect. 1 of the Act certain other violent and criminal offences against the person under an Act of 1861 and the Criminal Law Amendment Act 1885 are also punishable.

Baby Farming.—The Act provides for inspection and control. The persons having the care of infants for reward must give notice to the local authority which appoints visitors and inspectors of both sexes and, if thought well, in conjunction with philanthropic societies. Search warrants can be issued, and it is an offence to refuse admittance to a visitor. Persons who have committed an offence under this or previous Acts cannot receive or retain children. The number of children received can be limited. Children can be removed. Notice of death must be given to the coroner. Insurance policies cannot be taken out on the lives of such children.

Miscellaneous.—A penalty is imposed for exposing a child to danger of burning or scalding by reason of an open grate (Sect. 15) or for allowing a child to reside in or frequent a brothel. Two years' imprisonment is the penalty for encouraging the seduction or prostitution of a girl under 16 years of age, or for allowing her to consort with or enter the employment of any person of immoral character (Sect. 17). The magistrate may require security from the parent or guardian not to expose the girl to such risk. Further

precautions are provided for the detention of children in safety during trial and for placing them with respectable relations or friends or with societies or industrial schools or reformatories afterwards. In cases of homicide or grave crime the Home Office has to provide special places of detention; one of these is the Borstal Institution at Rochester. The parent is compellable to attend the juvenile court and can be fined in lieu of the child. No sentence of felony or death can be recorded against any person under 16 years of age. Any court may be cleared for a child to give evidence. No child may be present at any trial in which he is not concerned.

No pawnbroker or dealer in old metal may deal with a child under 16.

Vagrants who keep children from school can be fined and the children may be removed to a certified school.

Liquor.—By Sect. 119 of the Children Act any person giving a child under the age of five any intoxicating liquor except by doctor's order can be fined £3. No child under 14 can be allowed in a bar, and the licencee or any person bringing the child in may be summoned by the police and fined. Railway and other bona-fide refreshment rooms are excepted.

Entertainments for Children.—Where the majority of the audience are children and the number exceeds 100 the occupier is responsible and can be fined up to £100. He must provide a sufficient number of adult attendants to take precautions for the safety of the children. His licence may be revoked (Sect. 121).

Verminous Children.—The local authority may direct their medical officer to examine the children in any provided school and remove and cleanse any verminous child after notice to the parent who can be fined on a second offence.

Presumption of Age.—The decision of the court on the hearing can be given on such evidence as is available and is final even if direct proof of age is subsequently forthcoming. The onus of proof that the person is over age lies on defendant, and if strictly proved at the time is a good defence.

Reformatory and Industrial Schools.—Part IV. of the Act is a code regulating these schools. Briefly, reformatory schools are those provided for youthful offenders between 12 and 16 years of age who have been convicted of some offence punishable in an adult by imprisonment. Industrial schools are those for children under 14 (*a*) whose parents cannot control them and consent, or (*b*) who are found begging under any excuse, wandering, destitute, having drunken or criminal parents, or associating with thieves or prostitutes or in immoral surroundings, or (*c*) children under 12 who, if over 12, might have been sent to a reformatory, or (*d*) any refractory workhouse child under 14, or child who cannot be made to attend any elementary school. In the alternative any child who could be committed to an industrial school can be committed to a relative or other person nominated by the court. All these schools are inspected and controlled by the Home Office, but they are provided at the expense of the local authority which can borrow in order to provide them. They are certified by the Home Office and the certificate may be withdrawn. Managers are appointed to look after these schools and their expenses are paid. The funds are partly supplied by the Home Office, partly by the parents of the children, partly by the local authority.

Scotland.—The Secretary for Scotland is substituted for the Home Office and there are other provisions so as to extend the Act to Scotland. What is called the police court in England is the sheriff's court in Scotland, the workhouse becomes the poorhouse, and the coroner the procurator fiscal.

Ireland.—The Act also applies to Ireland.

Juvenile Courts.—The most conspicuous advance is the development of juvenile courts, which have been a great success and have been adopted in most towns. The appointment of women magistrates is also a step in advance and an additional good influence. By 10 and 11 Geo. V., C 68 (Dec. 23 1920) a woman justice must sit with the magistrate in a juvenile court. They are chosen from a panel nominated by the Home Office. The idea of the juvenile court is to get the child away from the criminal atmosphere and the kind of public which frequents police courts, and from the procedure in which the terrified child was placed in a high dock surrounded by members of the police force in uniform, too frightened to tell the truth or know what was being said in the case. The proceedings are conducted in a quiet room by a magistrate who tries to get the confidence of the child and act as a father would in a like case.

Defective Children.—Much has been done for defective children since 1893. The Board of Education has issued consolidated regulations (Cmd. 617) dealing with:—(*a*) medical inspection and treatment of children in elementary schools; (*b*) provision of meals; (*c*) schools for blind, deaf, defective and epileptic children; (*d*) physical training; (*e*) evening play centres.
